Western Washington pear orchards have sent less fresh fruit to the East this year because of greater activity on the part of the canners. Five-year contracts have been made with many pear growers.

A National Poultry Congress, it is announced, will be held at Spokane during the time of the Inland Empire Poultry Show, December 14-19. The managers of the show expect to have big exhibits from coast and eastern sections.

An Austrian laborer at Colfax, Washington, has been arrested and charged with putting matches in the grain before threshing. Over 100 machines have been destroyed by mysterious fires this year. The cause has been finally traced to matches placed by dissatisfied laborers.

Don't Feed Butter
Fat to the Hogs

To get every ounce of butter fat from your milk, the bowl of your separator must spin swiftly and smoothly. This requires a special oil. The oils you use on your other farm machinery are not suited to the delicate, high speed mechanism of the separator.

Standard Hand Separator Oil

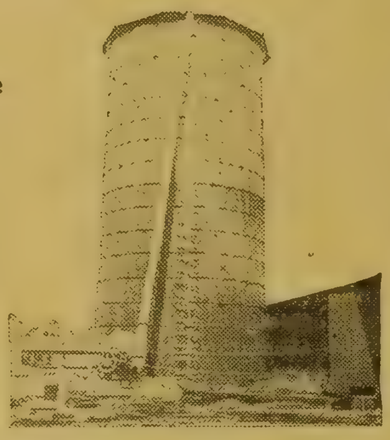
is of just the right body to quickly reach those finely adjusted, close fitting bearings. That is why it will give you perfect lubrication. If a better separator oil could be made, we would make it. Dealers everywhere.

Standard Oil Company
(California)

SILOS

All sizes and dimensions made to order for your particular conditions.

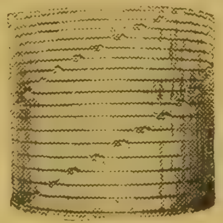
This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.



TANKS

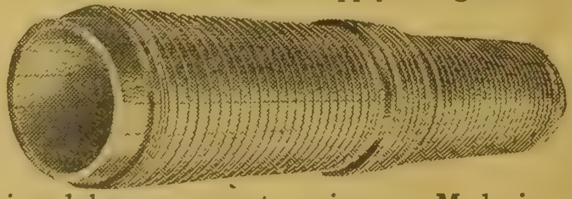
From 500 to 500,000 gallons capacity.

Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.



PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

CALIFORNIA BUTTER SCORING CONTEST

The third entry scored at San Francisco July 27, 1914, is thus described by Leon M. Davis:

Departing somewhat from the usual custom, the third entry of the 1914 California Educational Butter Scoring Contest was held in San Francisco instead of at the University Farm, Davis. The butter was sent to one of the wholesale butter houses, and was held under market conditions for three days. The scoring took place Monday, July 27, and was done by Mr. T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, H. H. Douglass and L. M. Davis of the University Dairy Division. With the exception of those who do not wish their scores published, those entries scoring 90 and above were as follows:

E. V. Allen, University Farm Creamery, Davis	95
J. C. Phillips, Delta Creamery, Imperial	94½
J. P. Dawson, Star Creamery, Holtville	93½
L. Larson, Sunset Creamery, Loleta	93½
Simon Koppes, Montague Creamery, Montague	93
Peter Peterson, Valley Flower Creamery, Ferndale	93
P. M. Becker, Grizzly Bluff Creamery, Grizzly Bluff	92½
W. J. Grinsell, Libby, McNeill & Libby, Loleta	92½
V. Baciarini, Suisun Creamery, Suisun	92
Will Paulson, Siskiyou Creamery, Greenview	92
T. P. Fisk, Swift & Co., Hardwick	91½
W. H. Gilbert, New Era Creamery, Gustine	91
N. Christenson, Dairymen's Co-op. Creamery, Tulare	91
G. G. Plunkett, Visalia Creamery, Visalia	91
Peter Peterson, Santa Rosa Creamery, Santa Rosa	90
Ed. Hooper, Spreckles Market Creamery, San Francisco	90

Hot Weather and Buttermaking.

The butter as a whole was a very good lot for this season of the year. Much of it came from the interior valleys, where hot weather is being experienced, and where natural conditions are decidedly unfavorable to good cream production. A study of the method blanks reveals that most of the creameries are receiving their cream daily or every other day, and suggests that the source of any flavor trouble which was present must have been due to the methods of holding the cream rather than to the length of holding. A very common criticism was high flavor, and this was caused in the majority of cases by the fact that the cream was high in acidity when received by the buttermaker.

It occasionally happens that dairymen will take very good care of their cream in the dairy, but this point will be neglected in transit. Or it may be that the creamery which employs a hauler will have made provision for keeping the cream cool on the wagon, but this effort will suffer a handicap through neglect on the part of the dairyman. When cream is delivered daily and still is criticised for high acid flavor it is evident that somewhere in the hauling there has been a slip. Just now is the time when dairymen should be paying special attention to the cooling of their cream. A material amount of good may be done by placing the cans of cream in cold water as soon as the separating is done. Cold cream and warm cream should never be mixed. Freshly separated cream should be cooled first before mixing with that from the previous skimming. A very satisfactory type of cooler is the tank cooler which may be made at the dairy with little expense. A barrel may be made to answer the purpose. The cold water entering this type of cooler should enter at the bottom and the overflow should be slightly lower than the upper level of the cream cans. Bulletin 209 of the California experiment station contains information relative to such a cooler, as well as a discussion of other matters interesting dairymen.

There is never a lot of butter examined but that some is found possessing those old stale flavors which are the result of holding cream too long, holding in dirty utensils, or in places where foreign flavors are absorbed. The activity of the butter inspector in San Francisco lately shows plainly that poor butter will not pass, and that some one has to pay the penalty for inferior goods. This will finally work back to the man who produces them, so the dairymen cannot afford to run the risk which poor cream invariably causes. First, let the dairyman produce a first grade article, then let him insist on its receiving good care in transit. If hauling it himself there should be no trouble, and if the creamery gathers it, let him insist on some form of protection on the cream wagon. Patrons who ship to some creameries have burlap jackets for their cans, and these are dampened to aid in keeping the cream cool.

BUTTER SCORING CONTEST AT THE STATE FAIR

California buttermakers should be interested in the big state fair contest which will be held in September. The premium lists, which are already out, show a pro rata prize fund of $400 for creamery butter, with liberal special prizes. Copies of the premium list may be obtained by writing to the secretary of the State Agricultural Society, Sacramento. Buttermakers who have been taking part in the educational scoring contest will be credited with their state fair score as their regular fourth entry. Every creamery buttermaker in California is urged to get in on this, and help to swell the dairy products exhibit. There is much to gain and nothing to lose.

Depraved appetite (pica) in cows, in which they eat dirt, gravel, etc., is generally the forerunner of a more serious affection of the bones and is due to a deficiency of bone forming elements in the food. Finely ground bone meal added to the food assists in overcoming this affection. Such cows should also have access to a piece of rock salt where it can be licked at will.

LIFE HISTORY OF THE TWO WARBLE FLIES

By Hans Glaser, Berlin.

The writer reports upon the continuation of his investigations into the life history of the two warble flies of cattle, undertaken for the committee for the control of warble flies. Altogether 314 warble flies were bred from 375 mature larvae that had spontaneously left their warbles; of these, 208 were the large Hypoderma bovis and 106 smaller H. lineata. In this connection it was found that the issuing of the larvae took place early in the morning and in by far the greatest number of cases while the host animals were standing or walking and only exceptionally while they were lying down; it begins mostly half or three-quarters of an hour after the animal stands up, and is interrupted if the animal lies down again. The writer explains this fact by the difference in the tension of the skin of the cattle.

On the same animal larvae of the large and of the small warble fly may be found. On issuing from the hide they are easily distinguished. The larvae of H. lineata are smaller and more slender than those of H. bovis and when mature they are gray brown, while those of the larger fly are greenish brown. The color is a sure test, even when small and slender larvae of the larger fly are found. In general the larvae of the smaller fly are somewhat earlier than the others.

The change into pupa takes place on warm and dry days mostly within 24 hours; in rainy and cold weather the process lasts two and four days. The larvae of H. lineata always require less time for the change than those of H. bovis. The pupal stage of the small fly averages 30 days, that is 14 days less than that of the larger fly. In general the males have a shorter pupal stage than the females; thus the latter, on issuing from the pupa, always find sufficient males with which to mate.

The emergence of the flies takes place in the early morning and by preference on fine sunny days; this explains their appearing in large numbers when the weather is fine. The swarming of Hypoderma lineata is for the most part in June, that of H. bovis in July.

The deposition of eggs takes place most frequently immediately after mating. Both the small and the large fly generally lay their eggs on the legs, and by preference on the hind legs a little below the hock. Besides this, the writer saw the flies frequently depositing their eggs on the belly of a calf used for experiment. Occasionally a fly would settle on the flanks or breast. No fecundated female ever deposits eggs on the back of the calf. The animal always became very excited on the approach of a female fly, whence the writer concludes that during June and July, and perhaps August, the gadding of cattle is due to warble flies. The fly causes its eggs to adhere to the hair of the host and the writer observed that the large warble fly sticks only one egg per hair, while the small fly sticks several of them on one hair, as many as 15 having been counted.

The egg of H. bovis is larger and more slender and more pointed at the free end than that of H. lineata. Further, the stalk which joins the egg of the large fly to the extension that embraces the hair is thinner than in the eggs of the smaller fly. The habit of the small warble fly of laying several eggs on one hair explains the fact that during oviposition it fastens itself more firmly to the hair than the other fly; it holds its ovipositor nearly parallel to the hide of the animal, while H. bovis sinks it almost vertically into the hair. The number of eggs that one fly can lay under favorable circumstances was determined by the writer for one H. lineata: it amounted to 550.

In the eggs very spiny maggots or bots develop after a few days; they issue from the eggs on to the hide of the animal; the writer assumes that the cattle take up the larvae rather than the eggs.

The writer has also conducted experiments in order to ascertain if the larvae of the two warble flies are able to penetrate into the skin of man and of animals. The result has always been negative as regards cattle, but in man, in one case (on the writer himself), a larvae penetrated the skin of the thigh.

Last year for the first time infection experiments could be carried out on six cattle with fecundated eggs and larvae. The results, however, will not be determined till the spring. The writer hopes soon to be able to report upon the most suitable methods of controlling this pest.

It has been proven that ropy or stringy milk can be carried from one place to another by milk utensils not being thoroughly cleaned and sterilized, and in this case the only remedy is a more thorough and careful cleaning.

PUT IT UP TO YOUR COWS
LET THEM DECIDE THE VALUE OF
LARROWE'S
DRIED BEET PULP

They'll quickly show you the true worth of this healthful, succulent, vegetable feed—and in the way most pleasing to every dairyman;—more and richer milk at no extra cost.

Larrowe's Dried Beet Pulp is simply the natural root of the sugar beet—shredded, clean and pure, with only the sugar and water extracted. It is light and bulky; swells to about 6 times its dry volume when moistened. Keeps indefinitely.

Your cattle will eat it with relish. It aids the digestion, supplies the necessary carbohydrates that are so deficient in alfalfa, increases the milk flow and improves the general condition of health. No matter what your ration, try the addition of Larrowe's Dried Beet Pulp. You'll also find it valuable for fattening stock, sheep, hogs and poultry.

"According to experiments conducted at the New Jersey Experiment Station, three or four pounds of dried beet pulp will produce practically the same results as 25 pounds of corn silage, fed in connection with alfalfa hay, or with clover hay and a suitable grain mixture."
—Hoard's Dairyman.

Larrowe's MOLASSES-DRIED BEET PULP
—is preferred by many feeders on account of its sweetness. Just the plain beet pulp with beet molasses-dried. Fine for fattening; also for horses. Try one sack and see how your cattle take to it.

OUR BOOKLET—"Profitable Feeding" with full information, sent free on request.

Prepare Your Stock for the Dry-Feed Period

It won't be long before your stock will be going on dry feed, and I'd advise you to get them in first-class condition for that time. Start right now and give them a tonic.

I know of nothing to equal Dr. Hess Stock Tonic for putting stock in good shape—strong, healthy and well able to stand the ravages of disease.

GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

DR. HESS STOCK TONIC
A Conditioner and Worm Expeller

This preparation is the result of my lifetime experience as a doctor of veterinary science and doctor of medicine. It contains tonics for toning up the system and enriching the blood, laxatives for regulating the bowels and vermifuges for expelling worms. As a worm expeller, I say emphatically that this preparation has positively no equal, and I'll back this statement up with the strongest guarantee you ever read. Here it is:

☞ **So sure am I that Dr. Hess Stock Tonic will keep your stock healthy and expel worms that I have authorized my dealer in your town to supply you with enough tonic for all your stock and, if it does not do all I claim, just return the empty packages and get your money back.** ☜

West of Rockies: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion. Never sold by peddlers, but only by reputable dealers whom you know. I save you peddler's wagon, team and traveling expenses, as above prices prove.

Dr. Hess Poultry Pan-a-ce-a

A splendid poultry tonic that shortens the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also helps chicks grow. Economical to use—a penny's worth is enough for 30 fowl per day. West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c, 3 lbs. 60c. I guarantee it.

Send for my free book that tells all about Dr. Hess Stock Tonic.

Profit in the Poultry Yard

ROOSTER DAY

Mr. Quisenberry, director of the Missouri State Poultry Association, writes regarding "Rooster Day" and states that over 250,000 birds were marketed on that day. All dealers united in helping along the "celebration" of this day. In fact, an entire week was given over to the disposal of roosters. The point was to reduce the loss which is greater in fertile than in infertile eggs. Mr. Quisenberry states that from this one cause alone between $1,000,000 and $2,000,000 dollars annually is lost in the state of Missouri.

From reports received from them thus far it is safe to say that a quarter of a million males were marketed by Missouri farmers during "Rooster Week." This movement also will result in the improvement of the quality of the poultry as most of these farmers will replace their scrub males with pure bred males. It will also result in the improvement of the cleanliness of the egg, the method of handling, and the improvement of the quality in general. The fact that farmers show enough interest in the quality of the eggs they market to dispose of their surplus males and market infertile eggs shows that they are making progress and taking some interest, and there will be a general improvement in the poultry business along all lines in this state as a result. The object in "Swatting the Rooster" is not to keep bacteria out of the egg as some seem to imagine, but to prevent chick development in fertile eggs. Before the eggs pass through the hands of the farmer, the country store, the local dealer the wholesale jobber and the retailer, and by the time they reach the consumer, there has been considerable delay. An egg does not have to be in an incubator for the embryo to grow and develop, but chick development takes place in a hot country store or a living room or on a hot country road, on the road to market, or in any place or under any circumstances where the temperature is as high as it is on most hot summer days. By eliminating the fertility, we prevent chick development which causes our greatest loss in summer months. I have some eggs on my desk which are over a year old. They have never decayed. The contents simply dried up. "Swat the Rooster" by all means if you have not already done so. Confine him if you wish to carry him over for breeding purposes another season.

POULTRY SHOW DATES

SILVER CUP FOR ORPINGTONS

In addition to the cups offered by the National Single Comb Buff Orpington Club for the National, Branch and State meets for 1914-15, a plan has been evolved whereby every poultry show in the world may secure a cup for best display of Single Comb Buff Orpingtons. Also five beautiful ribbons, suspended from emblematic medallions. Whether your show coops 100 or 5000 birds, write for full particulars. No show is too small to be included in this offer. M. S. Brady, secretary, Richards, Mo.

POULTRY NOTES

In parts of England turkeys are fattened chiefly on Indian corn, scalded Indian meal and boiled potatoes, with home-grown corn for a change.

It is claimed that the most delicious, juicy broiler that an epicure can fancy is a turkey poult of about six pounds weight, or when about two-thirds grown and of medium size. Many a young male two-thirds grown, would be too large to broil; if rather large, however, the breast may be gashed, and thus more easily cooked through, but it must not be dried.

The old way of carrying fowls by their legs or by the wings is not practiced by the present-day poultrymen. It is a cruel practice. Holding the fowl firmly by the legs and allowing the body to rest on the arm is a much better method.

It takes about two weeks to fatten a duck for market.

When the Indian Runner duck has reached a marketable age she has nearly completed her growth and has little left to do but complete her plumage and begin to lay.

A little granulated charcoal mixed in the soft food will generally check bowel trouble in chicks.

The writer almost daily receives letters asking for cures for ailments in fowls. The bulk of these at certain times of the year (principally winter) call for cholera cures. When the method of feeding is inquired into it is found that corn is the principal if not the exclusive grain given and the only grit available is some gravel, mostly round pebbles. This heavy feeding of corn with a lack of sharp grit is the cause of the complaints that come from the western states.

Close observation is essential to successful feeding. Prof. Lambert said: "The proper way to feed is to take a pail of feed in one hand and a pail of common sense in the other."

We must remember that the laying hen is the paying hen; that after a hen has laid enough eggs to pay for her keep for the year, then all the eggs she produces will be on the profit side of the ledger. So it stands us in hand to breed for the great layers. It can and is being done.

Hens that do not have enough green food supplied by the feeder sometimes eat too much of the tough, dry grass which they find on the ground when let out and become crop bound.

Good succulent green stuff should be on hand at all times. It should form a good part of the daily ration, for chicks need bulk as well as nourishment.

Successful Feeders!

of Cattle, Hogs, Horses, Sheep, Mules, Chickens, and all other farm stock, almost invariably use

Cottonseed Meal and Hulls

The feed that—costs less—produces healthy, sound flesh—makes hens lay more—causes cows to give more and richer milk.

AS A FERTILIZER

Cottonseed Meal has been used extensively in the South as a fertilizer, but not until cotton growing was started in the Imperial Valley was it introduced in California. Cottonseed Meal, containing 7% Nitrogen, 3% Phosphoric Acid and 1¾% Potash, is a very effective fertilizer when mixed with other materials. Let us tell you about this wonderful fertilizer.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trees Near Line.

If A plants gum and other trees one to three feet from B's fence with the result that nothing will grow on B's land for a distance of 10 to 12 feet from the trees, what redress has B?—Subscriber.

B cannot compel A to remove the trees, but if he can make proof of damage to his land we doubt not there would be good cause for action for actual damages proven. Of course, B can cut a deep trench which will stop the roots from spreading onto his land and taking the nourishment from the soil. This should be a case where a neighborly settlement should be easily made for it is hardly just for one man to use property of another to grow large trees, but there is no law which covers the case.

Tamarisk.

I send small branch from tree. What is its name? It is deciduous, grows rank and beautiful every summer.—Subscriber, Yucaipa.

This is the common tamarisk, and a beautiful tree.

Pruning Live Oak.

We have live oaks dug from the hills and planted. They have made a wonderful growth but we wish to prune and would like to know at what period of the year it should be done? The growth seems to be largely down, that is, of a weeping habit.—Subscriber, Yucaipa.

We do not think there would be any particular injury in pruning at almost any period, though freer cutting should perhaps be in the springtime, say from January to March. The weeping habit cannot be controlled, that is probably the nature of the tree and the cutting off of lower branches, while securing temporary advantage, will not permanently change the habit of growth.

Hog Wallow.

Where hogs have plenty of room and shade is there any advantage in building a cement pond for them to wallow in?—Subscriber, Lakeside.

On this point we quote from Coburn's Swine in America:

"Where it is found desirable to use water from a surface source, the best plan is to construct a pond which will afford a minimum of danger, and to fence it so that the stock cannot get at it directly. The water may be supplied in a trough, through a pipe in the dam.

"Stockmen differ widely as to the advisability of hog wallows, some of the most successful breeders heartily favoring them, while by others they are vehemently opposed. Some maintain that a wallow is a benefit and almost as necessary as the feed trough, and others would not permit one on their farms. W. H. Haskell, warden of the Kansas state penitentiary, says that 25 years experience in raising hogs in large and small herds has convinced him that the first step to take in arranging a hog lot or pasture, is to fence out any running or pond water so securely that the hogs cannot get to it. A herd of 600 hogs is maintained at the Kansas penitentiary, and Mr. Haskell says that prior to the adoption of this plan, considerable loss was experienced from cholera and other diseases, and that exclusion from all surface water apparently put an end to such losses.

"A. J. Lovejoy says: 'I have a good many lots and not a water hole in them. Hogs will stand more traveling if kept dry. They may be kept from getting overheated by having good shade. We use temporary sheds 16 feet square, covered with brush so the water may leak through, but they never get muddy.'

"On the contrary, N. H. Gentry says: 'Creating a breed of hogs that do not like to wallow is going outside of nature. People take mud baths for rheumatism. You may have a clean brook, but the hogs won't like it. I built boxes for them to bathe in, and five minutes after the hogs got out they would be dry. Earth is a good disinfectant. I do not believe in a filthy place, but I never saw a hog that did not like a mudhole, and when he gets in it he does not want water but wants to wallow in the mud. It cleans the scurf from his skin. If before taking him to an exhibition you let a hog wallow in mud, you secure a skin finish you cannot obtain in any other way. Nothing is more soothing than mud. I tried to believe for years that it was not for the hog's good, but I tell you that depriving a hog of his mud bath is against nature. Nature is a pretty risky thing, either to play or fight with. I do not believe all stiff hogs have rheumatism. I had an imported sow that had never eaten corn in her life, and she foundered and to her death was stiff; as plain a case of foundering as I ever saw. I do not believe in fighting nature. What is better than to have the hogs go to a shady place and wallow, without too much water? I believe in mud baths, but I keep my hogs away from manure heaps, and always have shade over the wallows'."

For us, we prefer the wallow.

Planting Rose Seed.

How should rose seeds be planted? Should they be clipped before planting?—Subscriber, Pasadena.

Seeds of roses are best planted as soon as ripe. No special treatment is necessary so far as professional growers are aware though more light is desired. The most prominent of local rose growers and hybridizers, once applied to me for more specific information on the subject, stating that he had but indifferent success with rose seeds though he had personally visited the leading growers of Europe and looked into the matter thoroughly.—E. B.

* * *

From Bailey's Cyclopedia of American Horticulture we quote regarding propagation of roses from seed:

"Propagation of Roses.—The rose is propagated by seeds, cuttings, grafting or budding, by layers and by division. The genus is so large and diversified and our requirements are so many that the whole art of the propagator is needed to satisfy the claims of the Queen of Flowers.

"Seeds.—Roses are grown from seeds not only to obtain new varieties but also because many true species are economically procured in this way, e. g., R. canina, R. multiflora, R. ferruginea, R. rugosa, R. rubiginosa, etc. The seeds should be gathered in autumn and at once stratified with moist sand or allowed to ferment in tubs, with a little water and kept in a fairly warm place. When well rotted they can be easily rubbed and washed clean and should be planted at once, either in carefully prepared and well-manured beds out of doors or in pans or flats in a cool greenhouse. It is sometimes advised that the hips should first be dried and then rubbed clean, but this method often causes delay in germination, a matter sufficiently troublesome without additional complications. Whether they are planted under glass or in the garden it is difficult to forecast their coming up. It may be within a few weeks, e. g., R. multiflora under glass; or at the beginning of the second growing season after planting, e. g., sweetbrier seed, planted out of doors in November, 1898, may be expected to germinate in the spring of 1900, while R. rugosa sown at the same time may come up the following spring, i. e., in 1899, or, a season intervening, it will appear with the sweetbrier in 1900. Stratifying or fermenting the seeds tends to secure uniform germination within a reasonable time. It has also been suggested, and many things confirm the idea, that early gathering helps to hasten germination; in other words, do not wait for excessive ripeness, but pick the hips as soon as the seeds harden, sometime before the fruit is deep red. Until these matters are better understood, all rose seed sown out of doors, either in autumn or spring, should be mulched two inches deep with pine needles or other litter. Frequent examinations should be made in spring and the covering at once removed when the seedlings appear; if they do not appear let the mulch remain to keep down weeds and retain moisture in the seed-bed. Pans or flats in which seed has been planted should be kept at least 18 months before discarding, with the soil always moist. Notwithstanding the difficulties of germination, the young seedlings make most satisfactory growth and can generally be transplanted into nursery rows when one year old. When two years old they are fit for permanent planting. A winter protection of pine boughs is helpful to the young plants. Some seedling roses are extremely precocious, blooming before they are one year old, e. g., some hybrid perpetuals and polyantha roses. The first flowers of seedling roses do not always indicate their real character; in hybridizing it is well to wait for the second or third season before discarding."

Gape Worms.

Our chickens are affected with a disease which causes them to stretch their necks, close the eyes, and seem to swallow hard. They often wheeze as though breathing with difficulty. So far only the young chickens seem to be affected and they appear unthrifty.—Subscriber, Riverside.

I should look first for gape worms. You can only find out whether they are in the throat by inserting a loop of horsehair, a stripped feather tip or a wire gape-worm extractor. Dr. Prince T. Woods, in "Reliable Poultry Remedies," thus describes the operation: "Prepare a solution of one tea-

WATER PIPE CHEAP

200,000 FEET

All Sizes—Immediate Delivery.

Just received several carloads new and second-hand Water Pipe, Oil Well and Water Casing. Water pipe (per foot), ½-inch, 2½c; ¾-inch, 3c; 1-inch, 4c; 1¼-inch, 5c; 1½-inch, 6c; 2-inch, 7c; 3-inch, 15c. O. D. Casing (per foot), 2-inch, 6c; 3-inch, 12c; 3½-inch, 15c; 4-inch, 17c. Riveted pipe (per foot), 4-inch, 12c; 10-inch, 30c—also surface irrigation pipe. Many other sizes to select from. Prompt shipment. Write, wire or phone. Adams Pipe Works, 2030 Bay St., Los Angeles, Cal. Phones: Broadway 1264—F1917. (Under entirely new management.)

The Weber Wagon

This light farm wagon with brake and 1500 or 2500 lbs. capacity for one or two horses $65.00. Other styles shown in catalogue sent on request. Write today.

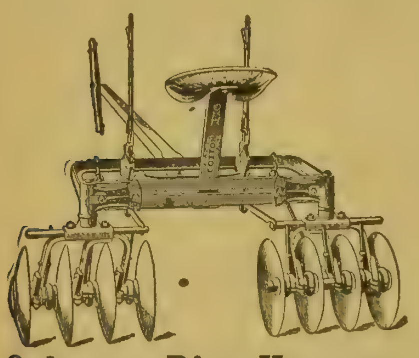
ARNOTT & COMPANY
116 South Los Angeles St., Los Angeles

When writing advertisers, mention Cultivator

spoon creolin in a pint of cold water. Hold the chick firmly in the left hand with its neck well stretched and head firmly between the thumb and finger. The mouth should be open and the neck held straight out from the body. With the chick held firmly and neck well stretched, dip the extractor in the creolin solution, shake off any excess of fluid, insert extractor gently into the windpipe, and withdraw it with a slightly twisting motion. This will bring out most of the worms, and any which remain will be killed by contact with the creolin solution. Be gentle and keep your hand steady."

The symptoms of gapes and bronchitis are very similar, and there is absolutely no way of knowing which it is except by looking for the worms. If, after several trials, you do not succeed in bringing out any worms, you may conclude that it is bronchitis and give a teaspoon of the following mixture two days in succession: One teaspoon castor or olive oil, 10 drops turpentine, five drops of either the syrup or the wine of ipecac.

Mix well as many teaspoons as you expect to need and give for two days. Keep the birds in a warm, dry place and feed bread and milk or a mash moistened with milk. Look for mold in the feed or litter. There is some good reason for the unthriftiness of these chicks.—J. A. K.



Osborne Disc Harrows

This well known harrow has extension frame and reversible gangs. Well made and gives universal satisfaction.

Destroying Blackberry Roots.

Is there any method of destroying blackberry roots without digging them out?—Subscriber, Hemet.

The best destroyer of blackberry roots is the hoe or hand cultivator. Of course, salt in sufficient quantity will destroy them, as will heavy applications of sulphate of iron solution, sulphuric acid, or even kerosene. These chemicals, however, are equally as injurious to any other growth. Carbon bisulphide will also prove effective and the soil will not be poisoned so long as with the other chemicals mentioned. This method of destroying by the use of chemicals would prove, we imagine, much more expensive than the liberal use of the hoe and shovel. If the ground is to be given over to crops permitting of clean cultivation it is comparatively easy to eliminate them but if a lawn is to be grown then it is another matter and it would be necessary to wait until the roots are entirely destroyed or removed.

Fungus on Snapdragons

Kindly inform me as to cause of fungous growth on snapdragon leaves and remedy for same. — Subscriber, Campbell.

One may as well attempt to account for the appearance of scarlet fever, diphtheria or smallpox in the human species. The fungus comes, and precisely why none can determine. Its appearance is due to the development of the spores or fruiting bodies. The best remedies are Bordeaux mixture or ammoniacal copper carbonate. The former is mostly used, but as it colors the foliage many prefer the latter. In all sprayings the remedy should be applied at the very earliest moment and, if an attack is anticipated, before the disease appears. When fungus once gets inside the plant tissue it is nearly impossible to destroy it, as nearly all fungicides prevent the spread or fruiting of the fungus on the leaf surface. Three or four sprayings are often necessary for complete eradication.—E. B.

Ambrosia Cream Co., Napa. Cal.
De Laval Dairy Supply Co., San Francisco, Cal.
Gentlemen:

The silo that I purchased from you this year has proven to be very satisfactory, and want to compliment you on the good clear 2x6 redwood staves that you used in the manufacturing of the same. There is no question as to the Ideal Green Feed Silo being superior to the resawed or home-made silos, as it is absolutely air-tight and is manufactured from first class material throughout.

In erecting my silo I did not use either a hammer or saw, except for the staging. I have been feeding out of the silo for several months now, and have yet to find any spoiled ensilage. No dairyman who expects to get the full results from his cows can afford to be without a silo, and from my experience with different silos, I am convinced that your Ideal Green Feed Silo is far superior to any other kind.

Yours very truly,
H. I. MIDDLETON.

Ensilage Cutters and Alpha Gasoline Engines

Scale on Oleander

Am sending twig cut from tree on my ranch. What is the scale-like matter on it and what is its cause and cure? The trouble has also spread to other trees. Is it contagious?—Subscriber, Nipoma.

The oleander leaves sent were a mass of black smut and the young of black scale. The scale insects were the cause of the smut, which comes because of honey dew exuded by the scale. Spraying the tree with distillate emulsion or any good contact spray would be beneficial and greatly reduce the pest, which is transferred from tree to tree either through the medium of the winds, feet of birds or otherwise. This particular scale infests a great many different plants. Even the common nightshade weed is often one mass of them and should be kept down. More valuable plants and trees should be treated with hydrocyanic acid gas.

Diseased Tree Bearing

Have several two-year-old lemon trees which were affected with gum disease, but are now healed over. Some of them are setting heavily with fruit. Should they be allowed to bear or should the fruit be taken off? Would you advise pruning the tree back?—Subscriber, Yorba Linda.

These questions can hardly be answered without knowing more as to the thrift of the tree. If it is in fairly good condition this will be indicated by the color of the leaves, their size and number. If in good condition there is no reason why some of the fruit should not be left on the trees. Pruning will stimulate more wood growth and put the tree in better condition for next year's crop.

Slugs.

Am enclosing leaves from Satsuma plum tree which is suffering, I believe, from fungous disease. Is there a remedy? When the leaves appeared in the spring they were yellow, then gradually turned green. The trees are three years old and the crop was not as heavy this season as last. The new leaves, the summer's growth, are not as badly affected as those formed earlier.—Subscriber, Newhall.

These leaves do not show appearance of fungous trouble so much as they do the depredations of some insect, or more probably, the slug. The tissue has been almost entirely destroyed, only the veins being left. If caused by slugs, they should have been given an application of air-slaked lime, which would very quickly have rid the trees of them. The yellowing in the spring when the leaves were first starting may have been caused by excess moisture in the soil or possibly by red spider. In any case it is too late to benefit these leaves this season.

Name of Bird.

In our preceding issue we have inquiry regarding the name of a bird. We now have from Mrs. A. E. Sussex, the following:

"In your issue of August 20, I note the request for the name of a bird. Although the description given is very meager, I should judge it was a shiny-crested fly-catcher or phainopepla niteus. They are shiny black, with inner webs of flight-feathers white. The female is a brownish gray; both are crested, and are a little smaller than a robin. Then there is another fly-catcher, very common in all parts of the state, the western black Phoebe or black-headed fly-catcher. It is a slaty black, darkest on head and breast. Under parts a light gray, white on outer tail feathers. About the same size as the former."

Also, Mr. Levi C. Kincaid writes:

"The bird asked about in 'Questions and Answers' on page 186 of issue of August 20, is the 'ash-throated fly-catcher' or pewee, as it is commonly called. It is of the genus muscicadae. Its chief food is flies and gnats, and it never eats bees. Nests in old wells, sheds, etc., and should never be molested.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Paralysis

I have some pigs weighing about 100 pounds each. Feed them milk, alfalfa hay and milo maize. They seem to lose the use of their hind quarters. Can you suggest a remedy? — Subscriber, Imperial.

Paralysis in pigs often follows their being confined in small quarters and fed heavily. Give them a field to run in and give them the following medicine: Salicylate of soda, two ounces, and tincture of juniper, enough to make one pint. Give each pig about two teaspoons in his feed once a day.

Malnutrition

I am anxious to know what is wrong with my 15-months-old heifer. She is always thin and the whites of her eyes seem to be bloodshot most of the time. She eats well, but never looks as strong as the rest that are the same age. She is of good stock and I would like very much to help her. What is wrong and what shall I do for her?—Subscriber, Orland.

Following are two prescriptions that will probably do her good: Raw linseed oil, one quart; turpentine, four ounces, and aloin, one ounce. Mix. Divide into two doses and give two days apart; also sulphate of magnesia, two pounds; chloride of sodium, one pound, and pulverized gentian, four ounces. Mix. Give a handful once a day.

Bad Teeth

I have a mare which recently developed a discharge from the right nostril, which continues intermittently. Before the discharge began I noticed a terrible odor from her breath, which still continues, although not so bad. The discharge is mostly clear, with some white lumps mixed with it, and does not come freely from the nostril unless the mare blows it out, which she does when being driven. The glands under the jaw on the affected side are swollen at times as large as a lima bean. The mare seems to have some trouble in masticating hay, turning her head so the right side is lowest. Otherwise she seems to be in very good health and is able to do her part of the work.—Subscriber, Acton.

There is probably a loose tooth in the right side of the upper jaw, probably the third or fourth upper molar. The tooth has been loosened or split by the horse biting on some hard substance in the feed, as a stone or nail. The swelling of the glands is caused by a little poison from the decayed tooth. It will be necessary to call on a veterinary dentist, who should be able to find the bad tooth and extract it.

Horse Sneezing

For the past six months my horse has been sneezing continually. What is the cause and is there a remedy?—Subscriber, Glendale.

Probably caught cold and has catarrh following it. Give him the following powders: Powdered gentian, three ounces; chlorate of potash, two ounces; and sulphate of iron, one ounce. Mix and make into 16 powders. Give one every night.

Kicked on Hock

I have a horse which was kicked on hock and which has been lame for some weeks. What can I apply that will aid in curing this trouble?—Subscriber, Burbank.

Have your druggist prepare the following liniment for you: Equal parts of spirits turpentine, spirits of camphor, aqua ammonia and oil origanum. Mix. Shake and apply twice a day. If it seems too strong dilute it with a little olive oil.

FOREST FIRES AFFECT STREAMFLOW

Residents of Wallace, Idaho, now claim that results of the disastrous forest fires in northern Idaho in 1910 are being made evident in the changed flow from a watershed then burned over, which furnishes the water supply of the city. This basin included an area of approximately 2000 acres and was formerly well timbered with trees from 50 to 200 years old. These were almost wholly destroyed by the fires of 1910. From this watershed the city gets its supply not only for domestic purposes, but also for the development of electricity for power and light, so that the maintenance of a considerable flow is essential to the city.

It is stated that before the fires the flow of the stream at its lowest stages was never below 1000 miner's inches, the unit of measurement which has been used. But since the fire, the records show that the minimum flow has fallen to about 250 miner's inches and it is now necessary for the company which furnishes water, light and power to expend a considerable amount of money each year in developing water from steam and to use a considerable part of this power in pumping water. Records of the weather bureau at Wallace show that the precipitation for the years since the fire has been about normal for the region. This seems to demonstrate to the townspeople that the unevenness in the flow must be due to the destruction of the forest cover of the watershed **and not to any** change in climate or precipitation.

In view of the situation, the forest service has undertaken to reforest the denuded watershed. Some planting has already been done and eventually all of the watershed which is included within national forest boundaries is to be reforested. The people of Wallace are taking considerable interest in the work and express themselves as thoroughly in sympathy with the effort that the service is making. The experts of the department, however, point out that the planting will probably have no immediate effect, yet it should influence run-off as soon as forest conditions are restored and re-establish eventually a more stable streamflow. In the meantime the forest officers are taking measurements of the stream in connection with the records of precipitation, to determine just what relation exists, and what results will follow reforestation.

TINKERITIS

By James A. King in Farm Engineering.

A fellow said to me the other day, "I've been thinking of buying a gas engine. But I am afraid I might not be able to run it. Some of my neighbors have had lots of trouble with their engines."

I told this man there was one thing he should always remember. That was that "tinkeritis" is more deadly than all other diseases to which gas engines are subject. The average man is only a grown-up boy. So many of us never outgrow the childish desire to tear the old clock to pieces to see what makes it run. We are too prone to do the same thing to a perfectly good gas engine. And in doing it we often make it into a worthless one.

When you buy an engine, have the dealer show you how to start it and to stop it. Have him show you these things over and over again. Show you step by step, explaining just why he does each thing. Try your own hand at the trick until you can do it with ease and confidence. Do not try to learn another thing than these fundamental essentials at this first lesson.

When the engine is set up, and you are left alone with it, be good. Don't try any fool nonsense with it. When you need it, start it: run it until you are through with it; then stop it. In the meantime leave it strictly alone, like dynamite.

I give you this advice, straight from the shoulder in this way, because I learned it by bitter experience.

Ranchers, Dairymen, Fruitgrowers and Investors

Are you looking for the **Best**—Absolutely THE BEST—conditions to be found in all California? Nothing like it anywhere else in all the State. Read and reflect—then write us for further information and full details.

Abundant and good irrigating and domestic water, **all** you want, when you want it, **as** you want it, any hour of day in the year at lowest possible cost (only the upkeep of ditches) averaging about 38c per acre, per year. One-half miners inch (about six acre feet) with every acre, from your own canal, with perpetual water right for every acre you buy.

The richest, loamy, easily worked soil, containing abundant lime and phosphates, producing enormous crops of alfalfa, grains, fruit and vegetables. (We just cut 28 acres of alfalfa, yielding 132 tons—almost 4½ tons per acre—at one cutting.)

Level lands, but with enough grade to irrigate easily, that can be cleared and prepared for crops at low cost.

Ideal conditions for live stock and poultry.

Good markets and R. R. transportation. Best of health conditions, in one of the finest climates in California.

Good neighbors, schools and churches, and solid banking facilities.

Positively the **VERY BEST** bona fide land proposition in the State, at reasonable prices and on easy terms.

Best of Bank and business references on request. We will demonstrate every statement to your satisfaction. You cannot afford to overlook this limited offer (only 55 forty-acre tracts in all) which is the new sub-division of one of the Banner ranches of this state. Just placed on the market by responsible owners. Write, phone, or call for further information and illustrated printed matter.

G. M. REA, Sec'y,

Suite 630 H. W. Hellman Bldg., Los Angeles, Cal.

SIR BUNNY O'RABBIT

Sir Bunny O'Rabbit was dashing and bold
To the tip of his elegant ear;
He wore a bycocket embroidered in gold,
He carried a dirk that was fierce to behold,
And no one who saw him would need to be told
That he was a buccaneer—
A
Regular buccaneer!

He sailed in a lugger, "The Pride of the Sea,"
And he scoffed at the notion of fear;
His raids were so carefully managed that he
Was always at home in good season for tea,
To eat enough lettuce and carrots for three,
For he was a buccaneer—
A
Vigorous buccaneer.

Though he and his crew were a desperate lot,
You will all be delighted to hear
That none of his prisoners ever was shot,
Or even deprived of what money he'd got,
For Bunny declared, "I am certainly not
That kind of a buccaneer—
THAT
Kind of a buccaneer!"

His victims were treated, I'm happy to say,
With a kindness so warm and sincere.
That sailors began to perceive it would pay
To let Bunny capture them every day,
Because he would dine them and send them away—
Benevolent buccaneer—
BE-
Nevolent buccaneer!

And thus it went on till he made up his mind
At the end of a profitless year,
That, taking the running expenses combined
With what he laid out on the captives he dined,
There wasn't a dollar in being that kind
Of ridiculous buccaneer—
RI-
Diculous buccaneer!

So now on the beach the proud lugger careens,
And Sir Bunny's not anywhere near.
He's living in Wales, amid pastoral scenes,
An honest Welsh Rabbit of moderate means,
Devoted to culture of succulent greens.
No longer a buccaneer—
NO
Longer a buccaneer!

—Youth's Companion.

MAJOR'S LIVE PINCUSHION

Major was a brave dog. It was very seldom that he cried or howled. So every one within hearing turned out to see what was the matter when they heard him coming up the hill, whining and crying. Tessie, the white cat, left her kittens and came. Johnnie Rabbit forsook a nice head of lettuce to join her; stately Peter, the Buff Cochin rooster, stalked to the hilltop and even old, lame Dickey Dumpling, the pony, stopped munching oats and asked what was the matter with his friend, Major.

Maje was coming very swiftly, running like the wind and yet stopping, once in a while, to dig at his nose and cry. The people at the Big House heard him and they all came out, too, wondering what the matter could be. Major's brother, Captain, was so anxious that he ran to meet his brother.

"What does ail you, Major," he barked, "and what are those queer things on your muzzle?"

"On it," howled Major, "in it, you mean."

"Well, what are they, anyway?" asked the other.

"Needles, needles and pins and swords," said Major, "that's what they are! And they're killing me."

"Where'd you get them?" said Captain, in astonishment.

Poor Maje howled again. No wonder, for there were at least ten of the sharp things in his nose and lips and he could hardly speak.

"I met a walking pincushion or needle cushion or something like it," he mumbled, "down by the brook, and I said: 'Get away, what are you doing here,' and just poked him a little, he was so slow to move, and he slung himself around and see what he did to me," moaned the unhappy dog.

"Bow, wow," barked Captain, "he must be crazed with pain. Whoever heard of such a thing?"

The people at the Big House had. When Major, head hanging in both shame and pain, was called to his master, that gentleman exclaimed: "Well, well, old fellow, this is hard luck, indeed. You've met a creature that I haven't seen one of for years."

"What is it?" every one asked all at once, and he replied: "A porcupine, and it's left some of its quills for poor Maje to remember him by. Don't feel ashamed, old boy. No one blames you for getting the worst of it."

"There," thought Captain, "it wasn't a walking pincushion at all. It was a porcupine, whatever that may be."

"Come, Maje," said his master, "it will take me a good hour to doctor your wounds and then we'll go back and see if we can find the prickly rascal. I suppose he's after nuts. No danger of his being gone; he's too slow a creature for that."

Major whined more than once while the barbs were being taken out, but he seemed to know that he was being helped and tried to be patient and grateful.

Captain went out and looked down toward the brook. He was very curious about this queer thing that had hurt his brother and that the master had not seen for so long a time. Captain was much less rash than his brother so no one called him back when he started toward the place where Major had been wounded. He asked Tessie, Johnnie, Peter and Dickey to go with him, but no one wanted to, and they all told him he had better wait until the master was ready to go with him.

Captain said he would go a little way and see if the curious thing had gone. He wouldn't touch it, if it were there. It might be gone before the others were ready and he really wanted to see a "walking pincushion," if such a thing existed. Down in the grove by the water, he saw something very odd. He saw a short-legged, stubby-tailed, furry animal that had, yes, there could be no mistake about it, needles coming out from the fur. The stubby tail possessed them also, but there were none on the little snub nose that stuck out from between two small black eyes. He was climbing a tree when Captain came along and the swiftness with which he went up the tree surprised the dog, for had not his mas-

THEODORE PAYNE
345 So. Main St. Los Angeles

ter, who knew about everything, said that the creature was "slow."

"Why, he can even beat Tessie at climbing, thought Captain, "and that is saying a good deal."

"Seems to have a few needles, but not enough to be called a cushion," he said, and then to let the animal know he was there he barked very pleasantly. "Bow, wow, how do you do?"

Then the creature became a cushion indeed, bristling with sharp points as he came down the tree and stood on the ground looking at Captain. All over the brown body they stood up and the stub of a tail was bristling with the pointed quills. He didn't say "bow, wow," but he did put his head down between his fore feet and give a sort of a grunt with a few squeaks mixed in. Captain understood. The pincushion meant to say: "Keep off, don't come near me."

Captain and the Pincushion

Long afterward when Captain was a bigger and wiser dog, he knew why the porcupine hid its nose. A very light blow on its poor nose will kill it at once. The creature knows this and always tries to protect this weak point.

"Major isn't bright," thought Captain, "now I bet he rushed right in and grabbed the chap, without thinking of the swords he carries. Say, old man," he called, "what did you jab my brother for?"

The porcupine calmed down a little.

"That dog," he squealed, "was he your brother?"

"Yes," answered Captain, "and he's mad clear through at you."

"Can't help it," grunted the funny bunch of fur and barbs. "I wasn't bothering him nor touching anything that belongs to him. I was just looking around for a few nuts and twigs, just as much mine as his, and he came rushing in here and ordered me out. I ain't going to hurry for anyone; in fact, I can't hurry if I want to, and while I was trying to tell him so, he rushed in and tried to bite me. I leave it to Mr. Woodchuck over there if it wasn't just so."

"Oh, never mind the woodchuck," said Captain, "I believe you, that's like Maje, he never can wait or let anything alone."

"He'll let me alone," said the porcupine, "if he knows when he's well off."

"Where'd you come from?" asked Captain, "if you don't mind telling a fellow."

"From the Mountain Woods," replied the creature, "since the great fire there this summer food is hard to find and we have to look some distance for anything good. Billy Possum brought word over that there were nuts and nice twigs going to waste here and that I had better come and get some."

"Well," said Captain, "if I were you, I'd be getting back now, for the master is fixing up my brother's nose and the first thing you know they will be down here, and then you'll see trouble."

"I ain't afraid," boasted the porcupine, "I can keep them off."

"Don't be so sure," advised the kind-hearted dog, and, perhaps the live pincushion, down in his stubborn heart, thought the dog right, for he soon began to waddle off with such a funny gait that the polite Captain nearly choked, trying to keep from laughing.

"It's a pity there are not trees for him to climb," he thought, "for he is the poorest walker I ever saw. He makes me think of Tessie's week old kittens when they try to travel. He's certainly the most ungainly thing that ever come on the place. It would be a shame to harm such an unfortunate creature, even if he wasn't full of spears. Maje was a little right, after all, he is kind of pincushiony, only they are pretty big pins."

When Major and his master came down to the brook, Captain was gone. Everything was still and there was nothing bigger than a bird to be seen anywhere. Bobby Woodchuck was there, but he kept out of sight, for he knew Major of old, and even if the dog's muzzle was sore he might try to catch Bob, if he showed his small head. It had taken so long to pick the quills from Major's nose and lips that even the slow poke pincushion who couldn't hurry if he would, and wouldn't hurry if he could, had waddled into safety and was where no dog dared venture after a bristling sharp-coated porcupine. — Orange Judd Farmer.

IDEAS FOR THE COOK

Written for the California Cultivator

By Isabel Cottle

Breakfast

Stewed Strawberries
Cheese Omelet Broiled Ham
Baking Powder Biscuits Coffee

Lunch or Supper

Creamed Sardines on Toast
Stuffed Potatoes
String Beans Buttered Beets
Rice Pudding
Tea

Dinner

Cream of Turnip Soup
Individual Meat Pies Egg Plant
Peach and Almond Salad
Fresh Figs Cream
Chinese Cakes Coffee

Cream of Turnip Soup.

One cup hot mashed turnips, one-half cup hot mashed potato, one tablespoon flour, one teaspoon salt, one-half an onion (this may be cooked with the turnip), two cups scalded milk, two tablespoons butter, pepper to taste. Mix turnip, potato and scalded milk. Melt butter, add the flour, salt and pepper, when well blended add the turnip mixture and onion cut in small pieces. Cook in a double boiler for twenty minutes, stirring occasionally, strain and serve.

Creamed Sardines.

Two small cans sardines, lump of butter size of walnut, two tablespoons flour, two cups rich milk, one chopped pimiento, salt. Drain oil from one can sardines, place with the lump of butter in hot skillet, when melted add flour and stir until well blended. Gradually add milk. When smooth and bubbling salt to taste, add chopped pimiento and sardines. As soon as heated through pour over rounds of hot buttered toast.

Chinese Cakes.

Beat yolks of six eggs, to each yolk add a tablespoon of sugar and one large tablespoon of flour. Flavor with lemon extract and one teaspoon ground cinnamon. Drop on a hot pan, well greased and bake in a quick oven. Make the cakes small.

Peach and Almond Salad.

Blanch and cut almonds in thin slices, using one-fifth as much in bulk of sliced almonds as of finely sliced peaches. Serve on lettuce leaves with a fruit salad dressing made by boiling one cup of sugar with one-half cup of water for five minutes, then pouring on the well-beaten yolks of three eggs. Return to the fire in double boiler and cook, stirring constantly, until it thickens. Cool and add the juice of two lemons.

QUITE TRUTHFUL

The man from the city was inspecting the country boarding house with the idea of spending the summer there with his family. "Of course," he began, "you have plenty of pure milk and the best butter in the state on your table."

"No."

"Fresh beef and lamb every day, killed on the premises?"

"I hain't."

"All kinds of vegetables in abundance, large orchard of choice fruits; cultivated berries picked every morning?"

"Say, mister! If I had all them things on this farm I wouldn't have to take boarders."

San Francisco Market

SAN FRANCISCO, Aug. 25, 1914.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to oive producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Extra butter is slightly off in quotation, but the trade predicts quick recovery. Prime firsts are now quoted equally high with extras.

Prices to trade 4 cents above following quotations:

Extras	27
Prime Firsts	27
Firsts	25
Seconds	22

CHEESE

Wholesaler to retailer.

California Y, America	14½@15½
California Flats	11@14
Cheddar	20
Oregon Twins	15¼

EGGS AND POULTRY

A slight advance noted in most grades of eggs notwithstanding Pacific Mail liner brought 16,000 dozen on Monday, and this shipment was reported in best condition of any yet received from the Orient. The trade is taking them at 18 and 20 cents per dozen. Some have been reshipped as far as San Diego.

Prices to trade 3 cents higher than following quotations:

Extras	34½
Firsts	30
Select Pullets, lb.	27½
Storage	30
Hens	15@18
Fryers	20@21
Roosters, old	12
Roosters, young	22@23
Broilers	18@20
Belgian Hares, lb.	10@13

HAY

Under date of August 21 Scott, Magner & Miller say:

Receipts of hay for the past week were 4797 tons. A few cars of fancy wheat hay arrived which were placed without trouble, but the great majority moves slowly and at very unsatisfactory prices. Sellers are forced to make concessions to place consignments. Most consumers show no inclination as yet to fill up for winter use, and are only buying as they need it. Third cutting alfalfa is arriving from the river, and is showing up as a rule much better in quality than the second.

Fancy Wheat Hay, lt. bales	11.00@12.00

Deciduous Fruit Market

Since our last bulletin a general European war is in progress, and the result of it is a general state of uncertainty as to future conditions. Whether it will or will not have any effect upon California dried fruits is a question at the present time that no one can accurately answer. We are giving the matter a good deal of thought, but, like everyone else, cannot predict the outcome, as nothing like this war has ever occurred.

The subject is very broad, and we are apt to drift along, anxiously waiting for something to happen one way or another; it may be a slump or it may be a strongly advanced market, but all depends on whether goods bought for export can safely reach their destination and be paid for, and whether the European crop can be harvested. As far as export business is concerned everything is at a standstill and everyone awaiting the result. In the course of a few days we believe that we will be able to learn something definite.

The F.O.B. coast market has an easy undertone. Very few apricot shipments are being made, but there is no export demand. The market is quiet on peaches, but some sales are being made. The financial situation in some of the large Eastern cities, induced by the European disturbance, has begun to have a severe effect on the wholesale grocery trade, as the banks are sitting tight on what money they have and are refusing credit, except in extreme instances. This has necessitated many of the dried fruit buyers staying out of future dried fruits until the situation clears. Purchases to date have been light, and the present situation means that buying will be deferred to a later date.

The action of our government will undoubtedly relieve the tension somewhat, as we notice that a statement by the controller of the currency says that the financial condition of this country is improving and that banks will be in a position to meet all reasonable requirements. The controller states that shipments of additional currency are being distributed over the country, which will go into immediate use, so we hope that business will resume its normal condition.

We have been informed that some of the dried fruit packers have refused to accept delivery from the growers for export shipment. It is a hard thing for a grower to determine whether his fruit is going to be used for domestic or export use, and on this account an effort may be made to beat down the price. We hope that growers will not get frightened and start to unload at prices they may be sorry for later, and which are below the cost of production. We realize for our members as good prices as they can obtain elsewhere, and by holding together we may be able to prevent the market becoming demoralized.

Apricots are practically all dried.

Peaches are now going on the trays as fast as possible, and deliveries will soon commence and it is more than likely that an effort will be made to bear the price, so we would impress on growers the necessity of not disposing of their peaches unless they are able to realize a fairly good living price. Quotations as low as 3¼ cents base, choice, by short-sellers have been made the last few days, but we hope growers outside the Exchange will not furnish fruit to bear the market. Speculators who have sold at low prices must buy fruit to fill orders, and if not able to buy at prices which show a profit they will be compelled to buy at an advance.

The Exchange is not trying to hold prices up to a point that prohibits consumption, but is endeavoring to get a price that will show the grower a living profit. Exchange members realize that co-operation is the only method of protection for the dried fruit grower. The Exchange is growing stronger and becoming a bigger factor every day in the dried fruit world, so we would urge growers to join and help along its work.

Prune picking and dipping is commencing, so we would ask our members to make deliveries as soon as possible, as orders must be filled and be shipped right on time to avoid giving buyers a chance to complain. Our reputation is at stake, and no effort must be lacking to build us up and strengthen ourselves, so do not wait to deliver your crop until you are all through drying, but deliver it from time to time, as fast as you get it ready.

After September 1st the offices of the California Cured Fruit Exchange will be located at 417 Market street, San Francisco.—California Cured Fruit Exchange, Sacramento, Aug. 10.

CALIFORNIA ALMOND GROWERS' ESTIMATE OF THE COMING CROP

Below we give an estimate of the California almond crop, which has been prepared after careful investigation:

Nonpareil

This variety will be much lighter than last season.

IXL.

These trees are always shy bearers and the total production in any year is small in tonnage. This variety will be about the same in quantity as last season.

Ne Plus.

This variety will exceed the production of last season by about 10 per cent.

As a whole, the above three Hatch varieties will not exceed the production of last season.

Drakes.

This variety will exceed last year's tonnage about 25 per cent.

Languedoc.

This variety will be about the same as heretofore. Last year we had about one-third of a normal crop. This year we estimate we will have not to exceed one-half of a normal crop. In the beginning there was a heavy setting of buds on the trees in all sections, but it seems that the trees did not have sufficient vitality, owing to the past two years of drouth, to mature the crop. The total crop last season was approximately 1150 tons. This year we estimate the tonnage from 1500 to 1600 tons. Of this the Exchange expects to handle 1200 to 1300 tons.

Quality.

Will be unusually good.

Prices.

Unless unforeseen conditions prevent, prices will be in our hands on September 1st.

Citrus Fruit Market

LOS ANGELES, Aug. 26, 1914.

Last week's shipments were extremely heavy, aggregating 338 cars as against 91 cars last year this date, 188 cars the preceding year, and 137 cars in 1911. Without question the present week's shipment will be lighter. This, together with the immense receipts in the eastern markets of watermelons, peaches and a few apples, makes a serious condition. However, prices are about the same as they have been in preceding years at this same date. August 10 to September 10 is considered the worst month for oranges of the 12. Mr. King of the Fruit Growers' Exchange is just back from a trip through the Northwest, including several hundred miles in western Canada, and reports orange market conditions seriously affected, not only by the season, but by war conditions. The lemon market is also in a most unsettled condition; the stopping of Mediterranean shipments for a time gave a speculative condition, and dealers buying some lemons at seven and eight dollars, which are long prices, boosted prices to $11 and $12. At the present time there are 60,000 boxes of foreign lemons afloat. They will reach New York in a short time, and this adds an element of uncertainty to the abnormal lemon conditions.

Shipments.

Shipments of oranges to date since November 1, 1914, 35,400 cars; lemons, 2,639; total, 38,042. To same date last season, oranges, 12,701; lemons, 2,008; total, 14,715. Total shipments of all citrus fruits two years ago this date, 33,176.

NEW YORK, Aug. 24.—Twenty-two cars Valencias, one car mixed Valencia and grapefruit sold. Market slightly higher in some instances. Weather fair.

WHAT GOLD CANNOT BUY

Gold is all you care for—it will buy the rest? You are rich—and, therfore, doubtless you know best! "All men yield to money, everything's for sale; gold means milk and honey all along the trail?

"Mighty is its power and men hold it high?" Can it coax a shower from the cloudless sky? Can it bring the playtime of your youth again? Can it keep the Maytime for the joy of men?

"Gold is splendid plunder, life's most treasured prize?" Can it buy the wonder of my true love's eyes—buy a spirit which is faithful, fond and sure? No? Oh, man of riches, you are very poor!—Berton Braley, in Dallas Dispatch.

ALMOST

There's almost as much pleasure in giving away something you don't want as there is in getting something you do want.

The only crime in making a mistake is making the same one twice.

PHYLLOXERA

(Continued from Page 199.)

scientists of France concluded there must be some vines in the native home of the insect that could withstand its attack. They argued that unless it changed its food the parasite would sooner or later destroy all the host plants and so commit race suicide. They set themselves the important task of investigating this problem and if possible discovering a remedy. Subsidized by the French government a commission of the very best available men was sent out to study the question in the habitat of the insect. The result was the discovery of resistant varieties of American vines, some of which, with their selected hybrids, are now being utilized in the struggle against phylloxera.

No vines are actually proof against phylloxera, but some can resist its attacks. The roots of such as possess a high resistance are hardier and protected with stouter coverings through which the proboscides of these dreadful little parasites cannot readily penetrate. Thus their food supply is restricted, and a consequent limit is placed on their multiplication such as does not take place on the roots of the ordinary European vine. In the truly resistant vine, too, the injured bark is excoriated, no mortification of the tissues takes place, and consequently the root itself sustains no perceptible damage. The task of the parasite under such circumstances resembles that of the mythical Sisyphus, who was condemned to roll up-hill an ever-returning boulder.

The insect and its host plant, the American vine, have been brought up together during centuries. Plants deficient in the natural protection speedily succumbed. The more robust and better protected were the best equipped to carry on the struggle. They survived. The different species were perpetuated by seed. Those seedlings that possessed sufficient resistance were allowed to remain. Those deficient in their resistant qualities were speedily weeded out by an inexorable law of nature, aided by the voracious phylloxera. The test was a remarkably severe one. In this way a high standard of resistance was secured, and the immunity thus obtained has been utilized by the vigneron who has found it to be the salvation of the viticultural industry.

NURSERY CATALOG

As first thought it seems a little out of season for nursery catalogs, though we are not certain but this is about the best time of the year to start next year's planting. In any case Mr. Frank Wilson and Mr. Charles Chambers of the Fresno Nursery Company are out with the goods, or at least making a showing as to the kind of goods which they will offer next season and we wish to say that the catalog and the accompanying price list, which were used to show the goods, are magnificent publications. The catalog consists of over 50 pages, on plate paper, and gives not only list, illustrations and description of plants and trees, but also a great fund of information as to time of planting, etc. The book is well worth the asking for, at least for one reason, and that is to note the changed expression of the man on the cover who has purchased "Reliable nursery stock from the roots up."

WHEAT
for Chicken Feed

We have several cars of small grain wheat, clean, sound and sweet. For a short time we offer it at the following prices:

Less than ton lots, $1.75 per 100 lbs.
Ton lots, $34.00 per ton.
Prices, f.o.b. cars Los Angeles.
Special price by the carload.
Sample on request.

Mr. Brigham of Long Beach bought 80 acres of Milford Land

Read this letter to his friend J. J. Brown of Long Beach

The following letter is unsolicited praise about the Milford Valley irrigated lands from a recent purchaser. The letter rings with frankness and truth. It is a calm, unbiased description of conditions as they exist today in Milford Valley.

Milford, Utah, Aug. 5th, 1914.

Mr. J. J. Brown
532 Esther St., Long Beach, Cal.

Dear Mr. Brown:

I arrived here day before yesterday and there was already a party of ten Imperial Valley farmers, with one man from Ventura and two from San Dimas, and I had the advantage of their judgment.

Milford lies in a valley surrounded by mountains on the Salt Lake railroad and the town has about 1700 or 1800 people. The railroad company has shops here and employs a good number of men. Surrounding Milford valley is quite an extensive mining district and an extremely large range of cattle and sheep. I am informed that there are about a million and a half sheep and in the neighborhood of 200,000 cattle on it. This alone should provide a good market for everything the farmer can raise. There are only 15,000 acres watered by the project, with little likelihood of any more being added.

The irrigation system which I visited yesterday consists of a dam with a concrete core 70 feet high, 350 feet thick and 1500 feet long, being built in a gap in the mountain, and am informed that it holds 27,000 acre feet. It is built in the strongest way that I could imagine a dam being built. The land watered by the system lies from 1½ to 8 miles south of Milford and is composed of a red limestone loam. Wells dug forty feet show only soil all the way. In my opinion the land is as good as Colorado or California, and I do not know of any more healthy place than this. The drinking water is found at a depth of about 40 to 60 feet and is clear and cold. The irrigation system provides clear, pure water for the irrigation.

I visited Minerville, which lies directly south of the land and which has been under cultivation for forty years, and I saw as good alfalfa fields as I have ever seen. I would think it safe to figure six tons to the acre for alfalfa. Oats should go nearly 100 bushels to the acre. Wheat would run from 40 to 60 bushels.

The trees are breaking down with apples and I saw pear trees that would grow 5 boxes to the tree. I saw the best plum trees that I ever saw, cherries both sweet and sour, all kinds of berries and as good gardens as you ever saw in California.

This land at $30 an acre I am morally sure will not be worth less than $200 to $250 inside of two or three years, and I bought 80 acres and have asked them to hold the 160 adjoining me until you can come up and see it.

They tell me they have an exsursion coming up about Saturday and if you could possibly come on that excursion I would advise you to do it.

Yours very truly,
CHAS. A. BRIGHAM.

$30 an Acre Adjoining Milford, Southern Utah, on Main Line of Salt Lake Railroad.

THE AUTO ON THE FARM

CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES September 3, 1914 SAN FRANCISCO

Hundreds of Miles of Such Roads in California

No place in the world offers more attractive mountain and seashore drives than does California. No farmer markets his produce over better roads than does the California farmer. And the biggest factor in placing on the market fruits and other products is the automobile. Proportionate to its population no section of the country equals California in the number of machines owned.

Studebaker

The Report Is True—Here Are The Prices

UNDOUBTEDLY—along with the whole country—you have been amazed at the prices for the new Studebaker cars—$985 for a big, roomy touring car and $1385 for a Studebaker "Six."

These would be extraordinary prices for just a "good" car.

What, then, can be said of these prices for a Studebaker car?

What, then, can be said of these prices when they carry with them the Studebaker name, the Studebaker reputation, the Studebaker character, the Studebaker guarantee—and Studebaker Quality?

It is too little to say they are extraordinary.

We believe these prices with Studebaker Quality are unprecedented.

Our fathers and grandfathers know the name Studebaker. For sixty-two years it has meant American vehicles, honestly, sturdily made. For sixty-two years farm and city homes have known Studebaker as the name for dollar-for-dollar value.

These sixty-two years Studebaker has grown enormously—in reputation, in production, in prosperity.

Today Studebaker means—in city and country—the acme of elegance as well as the acme of money-worth.

Today we give Studebaker owners and Studebaker buyers the benefit of sixty-five years of Studebaker growth.

That growth has made possible Studebaker Quality at Studebaker prices—and has made them possible for these reasons:

First, there is the huge volume of Studebaker production.

During the last eighteen months 55,000 Studebaker cars have been manufactured and sold.

This is the largest number of cars of one make, selling at or above the Studebaker price, ever produced in the same period by any manufacturer.

Second, Studebaker cars are manufactured cars—manufactured in the Studebaker plants.

Studebaker motors, springs, bodies, tops, drop forgings are made in Studebaker plants.

Special formulae for Studebaker steels are worked out and the steels are tested and analyzed in Studebaker laboratories, probably the largest and most completely equipped in the motor car industry.

Studebaker gears, axle-shafts, front axles, all vital parts are manufactured and heat-treated in Studebaker plants.

Studebaker, we believe, manufactures a larger proportion of motor car parts than does any other motor car producer in this country.

The completeness of Studebaker manufacture of Studebaker cars means better, stronger, longer-wearing materials — consequently Studebaker Quality.

But in addition, it means the saving of the parts-maker's profit, the waste and extravagance of the "assembled" or semi-manufactured car.

And that, in turn, means the economies that make possible Studebaker prices.

The volume of Studebaker production and the completeness of Studebaker manufacture mean the Quality and the Profit that go back into the Studebaker car you buy.

The Studebaker has the double distinction—Unique in Quality and Unique in Price.

The Studebaker Car of 1915 is an impressive example of what square-dealing, good building and right-thinking among the American people can do in sixty-five years.

Today the American people in town and country "Buy it Because It's a Studebaker."

The Studebaker Corporation of America

112 Piquette Ave., Detroit, Mich.

Specifications

The New SIX—5-Passenger and 7-Passenger

Electric Starter, Electric Lights.
Two body styles: Five-Passenger and Seven-Passenger Touring.
Wheelbase—121 inches.
Long-Stroke (5-inch), Small-Bore 3½-inch) Motor; Six Cylinders, en Bloc.
Special Dimming Headlights.
Smokeless, Non-Leaking Lubrication System.
New Exhaust-Silencing Muffler.
Annular Piston Rings.
Cellular Radiator.
Crowned Fenders.
15 x 2½ in. brakes.
34 x 4-in. Goodrich Tires on Q. D. Demountable Rims: Safety Tread on Rear.
Extra Rim and Locking Tire Carrier.
Roomier Front and Rear Compartments.
Continuous Aluminum Footboard.
One-Man Type Top.
Built-in Rain and Clear Vision Ventilating Windshield, Attaching Rigidly to Top.
Scientific Anti-Rumble Gasoline Tank in Cowl.
Magnetic, Non-Leaking Gasoline Gauge, the only One Approved by Insurance Underwriters.
Full Floating Rear Axle, Shaft Locking into Taper at Hub. Timken Bearings.
Full Equipment of 13 Timken Roller Bearings.
Irreversible Steering Gear.
Inter-Locking Ignition and Lighting Switches.
20 Operations in Painting Bodies.

The New FOUR Roadster and Touring Car

Electric Starter, Electric Lights.
Two Body Styles: Five-Passenger Touring; Three-Passenger Roadster.
Wheelbase—108 inches.
Long-Stroke (5-inch), Small-Bore (3½-inch) Motor; Four Cylinders, en Bloc, Exhaust Manifold Cast Separate.
Smokeless, Non-Leaking Lubrication System.
Special Dimming Headlights.
Pressed Steel Push-Rods.
Annular Piston Rings.
Tubular Radiator with Auxiliary Water Tank.
Crowned Fenders.
12 x 2½-in. Brakes.
Hot-Jacketed Schebler Carburetor Bolted to Cylinders.
Magnetic, Non-Leaking Gasoline Gauge, the Only One Approved by Insurance Underwriters.
Generous Footroom in Both Compartments.
33 x 4 in. Goodrich Tires on Q. D. Demountable Rims; Safety Tread on Rear.
One-Man Type Top.
Built-in Rain and Clear Vision Ventilating Windshield, Attaching Rigidly to Top.

Vol. XLIII No. 10 LOS ANGELES: THURSDAY, SEPTEMBER 3, 1914 One Dollar Yearly

Can the Farmer Afford the Automobile?

Yankee-like Many Farmers Answer the Above With the Question; Can I Afford Not to Own One? It is Becoming One of Our Greatest Blessings from Social, Mental and Economic Standpoints.

I remember very well the feeling which came over me in barefoot days when an older brother had reached the age which justified him in owning a young colt, and as the colt and the brother both grew, the "breaking" gave pleasure to the whole family; and still later when the youngster had reached the earning stage I recall very well the joshes which we all gave him when he brought home a brand-new "piano box" buggy. One of the first rides I ever had in that "piano box" was on a Sunday night when a mischievous sister tucked me away under the seat as the big brother started off to see his "'steady." Every youngster in those days felt that he must have a nice little roadster which must never be desecrated by being put before the plow, and one of the discussions of the day was: "Can the young man afford such a nice rig?"

A little later the velocipede came to take up some attention, but still the side bar was a matter of practical use, while the velocipede would do for the circus parade and as a novelty. The ordinary small town boasted but one or two. But with the coming of the bicycle Young America took a wonderful forward step. Bicycle clubs were formed and membership in such a club meant entrance to "the best society." It was "the thing to do" to join the bicycle club, wear knee-breeches, ribbed wool stockings, blue coat with more or less braid, and, of course, complete the uniform with a military cap. No county fair, and finally not even the ordinary country fair, was complete without bursts of speed by bicycle riders and the parade around the track by the bicycle club, the club showing the greatest attendance winning certain cups and prizes.

It was my fortune to belong to the bicycle club instead of owning the "piano box" buggy, and believe me, our club was really somewhat noted. We had the fastest mile rider of all northern Ohio; we also had the slowest rider, for at the fair after the mile race was off came the slow race. This was 100 yards, the bicycles—the old-time 50 to 60 inch wheels—to keep between two lines some six or eight feet apart and to consume the greatest time in making that 100 yards. The bicycle was not to stop nor was the rider to fall off. Soon the bicycle club passed and the machine became the practical vehicle for working people.

Then came the horseless carriage. The first time I ever saw it was in a circus parade. The auto followed, and its club, which is still with us. Of course at first it took the same sporty lines, later reaching the practical work-a-day stage. There was talk of the organization of a commisson or a something which should put the "kibosh" on the farmer who was so reckless as to invest his hard-earned money in an auto. This came about because somebody discovered that the cost of living was increasing, and, of course, the farmer was responsible for the increase because he required the auto for the pleasure of his family.

The commission, we believe, was never organized, but certain bankers, especially in the Middle West, took it upon themselves to scrutinize very carefully the financial condition of the farmer who presumed to ride in a gasoline wagon, and we were told that many were refusing loans to such foolhardy people. It was the old question of the "piano box" buggy and "Can he afford it?" Of course nobody presumed to question the right of the commission man or of any middleman to own all the gasoline machines he wished.

Today this question of "Can he afford it?" is seldom brought up, though, of course, there are yet those who will deny the youngster the pleasure of the ownership of his horse, buggy or anything which is not strictly proven a profit bringer.

But really, has not the auto on the farm proven to be a profit bringer? There are many cases, we believe, where the young people have been made content with the farm and have remained at home, willing, strong workers, where the auto has given them some little insight into the life of the world outside the farm. Formerly the tired horses could not be used to take the family to town of an evening; even to put them on the road on Sunday after a week's work was cruel. Perhaps gasoline is no more willing than the faithful old horse, but one is not constrained to pity it, and consequently has much more pleasure from a good long drive.

But outside of the pleasure and mental and social profit of the auto, thousands of farmers are making it of practical use in the delivery of produce. The prophesied neglect of his business has failed to materialize. Of course there are farmers and farmers—and always will be. But where there is one who will allow one of his horses who happens to be a good stepper to lead him to the race track or amongst sporty people, there is now and then one who uses the auto because of the sporty element connected with it, but there are hundreds who own cars merely because of their practical value.

The horse breeder has looked with regret at the popularity of the auto, and without question the breeder of roadsters and fast horses has been put out of business, or nearly so, but where he has turned his attention to the drafter or to the cavalry type of horse, he is still making money, for horses were never at a higher price than they are today.

The growth of the automobile industry is greater than that of any other in the history of the world. We have before us a publication on the auto which bears the date of 1913, which refers to the wonderful growth of the motor vehicle industry and to the fact that "There are now over 800,000 motor vehicles in the leading countries of the world." From a daily paper of August 30, 1914, we take the statement that there are now in the United States alone 1,584,350, or nearly twice as many as were claimed for the world a year, or a little more, ago. The first six months of 1914 showed a gain of 294,485 in this country. A book which was published last year also refers to the fact that the world's manufacture of autos might aggregate for 1913 a grand total of 300,000 cars. Since August 1, a single manufacturer of autos in the United States has announced that he will produce before August, 1915, 300,000 cars from the one factory.

California has the greatest number of autos of any state in the Union in proportion to its population. The total registration at a recent date was 102,148. Of the various counties Los Angeles led with a registration of 35,132; San Francisco County came next with a registration of 9955; Alameda, third with 7091.

NECESSITY AND LUXURY

Written for the California Cultivator
By Chas. F. Collins, Horticultural Commissioner, Tulare County.

I consider the automobile both a necessity and a luxury to the farmer as well as to thousands engaged in various other lines of business. It is a necessity because it is an accessory which the business methods of the present day demand. It is a luxury because of the enjoyment it affords its owner and his family or friends during holidays and leisure hours. At the present prices of feed and gasoline no one can afford to keep a horse for driving purposes on roads that can be traveled by an auto. When the difference in cost of upkeep and time saved for the amount of work done is taken into consideration it is all in favor of the buzz wagon. Many of the lighter machines will travel almost any road worthy of the name in one-fourth the time required by the average horse and at less expense.

It enlarges the world for its owner. Before its advent the radius of the average farmer's activities and acquaintance did not exceed 10 miles, while now the confines of the largest county cannot bound it. Not only is his circle of acquaintances enlarged, but as a natural consequence his business ability is increased, which is necessary in order to meet the requirements of his largely increased business opportunities.

It is not and never was right to take old Dobbin from the plow for a hurried trip to town. The auto now obviates all necessity for this. Faithful old Dobbin can now plow as he should while some member of the family runs to town in the "machine" to exchange the butter and eggs for needed groceries or transact other necessary business.

"When the weary day is ended" and the evening meal is over, what is more soothing or rejuvenating than a spin in the cool twilight behind the horse whose muscles never tire. Then when business permits a holiday this faithful steed will between breakfast and lunch time transport its load of joy-seekers from the hot and dusty plains to the altitude of giant trees and babbling brooks.

The automobile demands good roads and it is largely owing to this fact that our public roads are improving each year by leaps and bounds. It would be a difficult matter indeed to transact the business of the world without it. It came because the methods of the age demand it and it has come to stay.

THE AUTO A TIME-SAVER

Written for the California Cultivator
By W. E. Premo, Porterville

The automobile I find absolutely essential in my case as I am giving three ranches more or less of my personal supervision. With the machine I am able to spend practically all of my time at the ranches during the working hours of the men without serious inconvenience to myself although I live in town and at a distance of 10 miles from two of the ranches and 20 miles from the other one. The time actuallly spent on the road is inconsequential when compared to the time required by a team for the "rounds" of the ranches. I can manage the ranches better by using a machine than I could one without.

I find that it costs about six cents per mile to run a light car over the average country road, considering first cost, upkeep and interest. It is my opinion that every rancher who employs a few men steadily and has a good sized investment should have a light car in his equipment for expediting business, but not for keeping him away from home.

Every rancher's home should be on his ranch, but if he lives in town the automobile is absolutely essential. On the other hand if he lives on the ranch the automobile is absolutely essential to the highest development of his family home life. Good roads and automombiles almost annihilate distance.

CITRUS TREES

Buy from the largest Citrus Nurseries in the World

Citrus and Tropical Fruits

FROST CONDITIONS AND INJURY TO CITRUS FRUITS

By Carl Nichols

The condition preceding frost in California is the passage of a low area from Idaho southward across Utah, thence westward into southern Nevada, and, finally, southward into southern California. For the most part, frosts are due to the movement of cold air from the northeast. Frosts also occur when a low area over southern California moves rapidly southwest and is followed by a high from northern California. Conversely, when the air moves from the sea inland, there is little danger from frost.

Under the above conditions, the usual warm lower air strata are vigorously displaced by cold dry air, and when drainage ceases, and the cold air settles during a period of comparative stillness, frost forms. A close agreement also exists between frost belts or frost streaks and areas of stagnant cold air.

Conditions Preceding Frost in Southern California.

The topography of southern California favors drainage of the air from the mountains seaward at certain hours, and a return movement of the surface air inland at certain hours. Thus conditions are highly favorable for the formation of air streams, which reverse their direction at least twice in each 24-hour period.

In general the lower air flows to the southwest during the night and early morning, and to the northeast during the afternoon. During the winter months when areas of high pressure pass over the Great Basin, the surface air apparently moves south, crossing the northern flank of the Sierra Madre and descending with some momentum into the Great Valley. The wind movement is particularly marked in the vicinity of mountain passes. During these so-called "northers" or "Santa Anas," the temperature rises and the humidity falls. The existence of a low pressure area south of the Colorado seems to intensify high north winds. The frosts are undoubtedly traceable to a displacement of the air in the valley, ordinarily warm, by air that is not so warm, although not cold. The descending mountain air is, however, remarkably dry, and, while dust laden, has little water vapor. When the wind lulls, which is apt to occur after sunset, the soil which in many places consists of river wash, coarse sand, gravel, or sandy loam, loses heat rapidly by radiation. During the morning hours, and before the return flow of air from the sea, with its moisture, can be effective, there has been a rapid fall of temperature. Under such conditions it is usual to have a fall in temperature from 50 degrees at 6 p. m. to 28 degrees by 6 a. m., with temperatures near the ground 4 degrees or 5 degrees lower.

Resistant Varieties of Citrus.

The trifoliate orange (Citrus Trifoliata) has been long known as perhaps the most resistant of all the citrus varieties, to cold. This is a small, bushy and very spiny tree, with trifoliate and deciduous leaves. The tree is easily recognized in the nursery because of its trifoliate leaves and also because it produces usually from two to four or more tap-roots. The tree is commonly used as an ornamental as far north as Philadelphia, and as a hedgeplant in the south. The fruit is small, smooth, with acrid, bitter pulp and a large number of seeds, and is therefore worthless for eating. The trifoliate orange is deciduous and ripens its fruit early in the fall before frost. It is about two or three weeks later than the sweet orange in coming into bloom, and is never caught by later frosts, while the early ripening of the tree in the fall allows the tree to become dormant much earlier than the common sweet orange.

Because of its hardiness the trifoliate orange has been used to a considerable extent as a stock for edible varieties in Florida and in the limited plantings of Texas. It is said that the stock imparts some of its hardiness to the scion. The exact cause of the greater resistance to cold of a tree budded on the trifoliate orange is probably due to the fact that the growth is not so vigorous and sappy and the general shape of the tree is closer and more compact.

Of edible varieties of citrus, the Satsuma and the Kumquat seem to be considered more resistant to cold than most other varieties. Still in the great freeze in Florida where the temperature dropped as low as 14 degrees F., the trifoliate orange was the only one which escaped serious injury.

For California conditions the trifoliate orange should not be used. Orchards planted upon this stock have been pulled out. Moreover at the citrus experiment station at Riverside, Dr. J. E. Coit reports that trees budded upon this stock proved very little, if any, superior in resistance to cold.

Since the recent freeze in southern California, many conflicting statements have been given out as to the resistance of different varieties of oranges to cold. A. R. Tylor of the Whittier pathological laboratory reports that Tangerines and Mandarins are more resistant than Navels and Valencias, that Lisbon lemons are more resistant than Eurekas, that lemons are more hardy than limes and citrons, and that but little difference in hardiness could be found between full-grown Valencia and Navel orange trees.

Breeding Citrus for Frost Resistance.

In 1892-93, Webber and Swingle began the hybridization of various citrus varieties in Florida. These experiments were interrupted by the severe freezes of 1894-95 but were again taken up in 1896-97. One of the primary objects of this work was the securing of hardier varieties which would endure occasional freezes and which would be hardy enough to grow farther north than the usually recognized citrus belt. Many difficulties must be met in the hybridization of citrus fruits. Because of the well-known hardiness of the trifoliate orange it was decided to cross this with the common sweet orange. As these two varieties are very distinct in character it was found that with the greatest care only about two per cent of the flowers set fruit. However, from the few hybrids obtained, a

new variety of citrus fruits was originated, known as the citranges.

This new group of fruits is much hardier than the common orange and produces a fruit intermediate in quality between the two parents. The flavor is sprightly acid, similar to that of the lemon, and there is also a slight bitter taste as in the pomelo. The juice makes a fine drink similar to that of the lemon and may be substituted for the latter in other ways.

CITRUS FRUITS IN INDIA

By Henry D. Baker, United States Cousul at Bombay.

The most important district in India for the production of oranges (Citrus aurantium, var, sinensis) is Nagpur, in the Central provinces, about halfway between Bombay and Calcutta. In Nagpur the orange yields or can yield two crops a year. The plants flower from February to March and the fruit is ripe from November to December or January. The second flowering is from June to July, and the fruit ripens from March to April. The oranges of the second crop are the sweetest and coming as they do at the beginning of the hot season are much valued. These are plucked green and thus are rarely allowed to change into the characteristic yellow color of the other crop. About the middle of May the roots are exposed and the plants manured. Pruning is unknown in the Nagpur groves, and with the exception of being watered freely in the hot season, the plants receive little or no further attention.

Oranges are also grown in the Khasia hills in northern India; in the vicinity of Delhi and in the Nilgiri hill districts of southern India. It is quite impossible to furnish any particulars as to the extent of the traffic in these fruits, as they do not appear separately in any trade records; moreover, there is no information as to the area and yield in the whole of India. A few years ago a few parcels of Nagpur oranges were sent to London and appeared much appreciated, but owing to irregularity of supply the trade seems to have discontinued. The Nagpur oranges in appearance and flavor are much like those known in the United States as mandarins or tangerines.

Pomelos or Grapefruit.

The pomelo (citrus decumana) is a common fruit in India, especially in Bengal and South India. The best quality is the thin skinned Bombay pomelo, hence the South Indian name of bombalinas. This fruit is a favorite with the natives of India, the pulp being either white or red, according to the variety grown. The cells of the pulp are very large, and naturally separate from each other. This causes it to be sometimes spoken of as the grape orange. The separated pulp is largely eaten in India as a salad. The Bombay pomelo may be raised from seed sown in February or by budding in February to March on the common limes, or by layers made in pots supported high among the branches.

Citron.

The citron (citrus media, called in India "zamburi") is cultivated sparingly in the warm, moist regions of India, one form being so large as to resemble a pomelo. It is propagated by seeds or layers. It is often ripened within earthen jars before being removed from the tree, and is sometimes grown within molds to make it resemble human faces and other curious forms.

Lemons and Limes.

Lemons (Citrus media, var. limon) are fairly extensively cultivated here and there all over India, although most of the fruit known as lemons are varieties of lime (citrus media, var. acida, called in India "mitha nimbu"). The wild lime in India is the chief budding stock for all species of oranges, lemons and citrons in India. The juice of this fruit is universally used for flavoring soups, curries, fish, etc., since it imparts a pleasant acid taste and agreeable flavor. It is also largely used in domestic medicine. The small sour limes are extensively employed for sherbets and in the manufacture of lime juice and the large ones made into various preserves.

Every Rancher should own a Western Gas Engine

The Keen Engine Buyer Invariably Selects the Western

Simplicity, reliability, low operating cost—those are the vital points to be considered when buying an engine, and that's why the **Western** has gained such widespread popularity. On the up-to-date farm, in the shop, at the mines, in the oil field—in fact, wherever a dependable engine is needed you will invariably find the **Western.**

For ease of operation, smooth running, fuel saving, power, absence of trouble, etc., the **Western** is without an equal. Types and sizes from 4 to 180 h. p.

You should have our illustrated Catalog. It gives complete details.

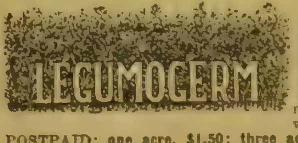
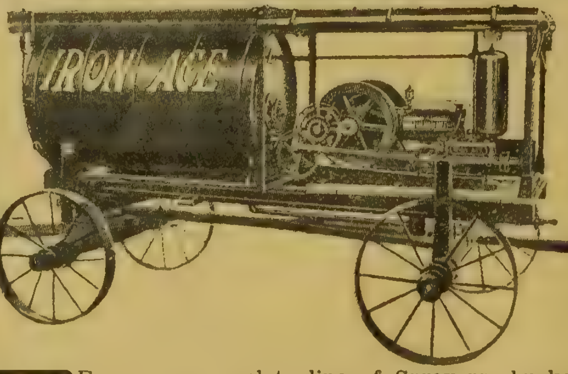
Inoculate Your Seeds



Heavy yields of Alfalfa, Clover, Peas, Beans and all Leguminous crops ssured if you use **Legumogerm.** Endorsed by well known seedsmen, gricultural journals and experts, and practical progressive farmers who peak from experience. LEGUMOGERM makes poor soil rich and rich oil richer. LEGUMOGERM is Nitrogen Fixing or Legume Bacteria, n Liquid Solution, to put on seeds when ready to plant. It adds nitrogen to the plant and thus to the soil. Bumper crops of corn, wheat and potatoes, etc., follow a well inoculated clover crop. PRICE POSTPAID: one acre, $1.50; three acres, $3.50; five acres, $5.00; ten acres, $8.00; twenty acres, $15.00; fifty acres, $35.00. Full Directions on every package. Special Discounts to Seedsmen and Agents. Cuts furnished for catalogues. Send for circular, "SOIL IMPROVEMENT." **Western Legumogerm Co., Topeka, Kansas**

SPRAY

With an IRON AGE



This cut shows Iron Age Power Sprayer No. 200W.

150 gallon tank; 2-horse engine, D.-A Pump, Relief Valve, Platform, Skids, Flooring.

Supplied with or without wagon gear.

WE carry a complete line of Sprayers—bucket, knapsack, barrel, power and traction—for every purpose. Spraying well done depends on the machine you use. Iron Age Sprayers are universally used and recommended. Write us about your needs or call and see us.

Valuable Spray Booklet—Free

Tells "why, when, what spray and with what machine." Send for a copy today.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogren in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and **BURR CLOVER** are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Deciduous Fruit Culture

ORCHARD AREA IN BELGIUM

The fruit orchard area in Belgium is being rapidly extended, recent statistics showing 179,710 acres, mainly devoted to apples, pears, cherries and plums, or an increase of 66,210 acres since the year 1896. Liege Province has 42,860 acres, followed by the Province of Hainaut with 36,850 acres, Province of Limburg with 21,000 acres, West Flanders 19,900 acres, Brabant 18,500 acres, East Flanders 18,150 acres, Namur 14,350 acres, Luxembourg 6250 acres, Antwerp 1850 acres.

The season of 1913 was decidedly unsatisfactory for orchard fruits, says a United States consular report, the crop having suffered from unfavorable weather, especially during the early portion of the year, but the demand from abroad forced prices to an unusually high level. The Germans are heavy buyers of Belgian fruit, purchasing the crops of entire orchards on the tree, immense quantities of apples being shipped across the German frontier from the provinces of Liege, Limburg, Namur and Luxembourg, the bulk of these apples being used in Germany in the manufacture of cider that is commonly sold as champagne, the apple waste being used for the manufacture of syrups, preserves and jams.

English fruit buyers, principally the manufacturers of marmalades and fruit preserves, purchase largely from the provinces of Flanders and the region of Tournay. The cherry markets of Loos, St. Trond and Tongres are well known and during the season the traffic of this class of fruit becomes so heavy that the government transportation agencies under the control of the department of the post-office are obliged to increase their forces in order to handle it. Thus, in spite of the relatively limited area available, Belgium is steadily becoming more important as an agricultural country, and the farm products, particularly orchard fruits, are more and more in demand for export. Of late years, however, instead of selling its supplies of fruit to foreign canning establishments, Belgium has developed to a large extent the canning industry at home, so it is probable that in future the demand for orchard fruits in this country for canning purposes will exceed the supply, causing a still greater advance in prices.—American Fruits.

HOW ABOUT IT?

More than 2000 years ago Cato wrote, "Be a good neighbor. Do not roughly give offense to your own people. If any misfortune should overtake you—which God forbid!—they protect you with kindly interest." The neighbor must do for the farmer what police, hospitals and charities do for those in the city. In any community, but especially in an irrigated country, the good will of a neighbor is of great value, and the bond of sympathy is made stronger and stronger as time goes on. The help of one's neighbor is of economic value to the irrigator, and a man may save many dollars by lending a hand to his neighbor when it is convenient, and accepting the same aid in return. That is one reason why it is seldom profitable in the long run to steal water from your neighbor, or quarrel with him concerning the same.—V. M. Cone, Colorado Agricultural College.

Small Fruits and Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator

During this month nearly all varieties of vegetables can be planted, except vines, it being rather late for cucumbers and too late for melons, squash and pumpkins, but it is a good time to plant peas, cabbage, cauliflower, radish, turnip, lettuce, beet, carrot, broccoli, Brussels sprouts, kohlrabi, onions, spinach, kale, mustard, Swiss chard, parsley and endive.

The market gardener in protected sections will also plant potatoes and acres of lettuce and cabbage. Southern California has become headquarters for early shipping vegetables as enumerated above, and many train loads are shipped to northern markets each season. During winter for this purpose the Los Angeles market varieties of lettuce are New York and Wonderful. Planted during this month it requires three months to mature.

In cabbage the Winningstadt is most largely used, but some shippers are planting Danish Ballhead and Cannon Ball, an earlier selection of the Danish. The latter makes a six or eight-pound head and produces two to three tons better yield per acre. than Winningstadt, which only makes a three-pound head.

Of cauliflower the most demand now is for a large head that is well covered, and probably the most popular is the Danish variety, Dry Weather, and also a variety on this market known as Pearl, a California grown selection of Snowball.

Clean up all dead vines and rubbish from garden and either burn or compost. This saves many insect and fungous troubles for next year.

THIS MONTH IN THE SACRAMENTO VALLEY

Written for California Cultivator
By S. S. Rogers

In planning to grow winter vegetables it is of the utmost importance that the proper location and soil should be selected. Under normal conditions the rainy season will commence in two or three months and if the proper precautions are not taken for the location of the garden serious losses may result. Before planting the grower should study carefully the desired crops to be raised and the special requirements of each. The two most important considerations in the choice of crops to raise at any season of the year, aside from the demands of the markets, are their soil and climatic requirements. The former is very difficult and often impossible to remedy, while the latter can often be improved. On account of their naturally good drainage and ability to remain warm the lighter classes of soils are generally better adapted for winter gardening than soils of a heavier character. In many gardens there will be found both of these classes and by a careful selection of the crops this difficulty can be overcome to a large extent, for some vegetables do better in a light soil, while others are better adapted to the heavier type.

For winter gardening such vegetables as lettuce, celery, onions, petatoes, radishes and peas will be found to be especially adapted to the light well drained soils, while cabbage, cauliflower, carrots, beets, parsnips, etc., will do well on heavy soil. Some of the above mentioned vegetables such as onions, radishes and beets can be successfully grown on either class of soil.

Where the drainage is poor raised beds will be found to be very satisfactory and are used to a large extent by the market gardeners. These are generally made four to six feet wide, four to six inches high and as long as desired. These are made very easily by the use of the plow, throwing the earth in such a manner that dead furrows are made every four or six feet. The soil on top of these beds should be worked into shape and packed slightly by the ordinary farm implements. The dead furrows are used for drainage, and if irrigation is necessary water can be run down them, seeping into the beds by capillarity. These beds are generally made about one to two feet apart so that these furrows can be used as walks, making it unnecessary to pack the ground in which the vegetables are growing.

The planting calendar for the Sacramento Valley for this month is the same as given in the California Cultivator on page 128 in the issue of August 6. As stated in the above-mentioned publication, only vegetables which are fairly resistant to frost should be planted. This list includes lettuce, cabbage, cauliflower, celery and all root crops.

The Ornamental Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator

August was a quiet month in the garden. With September comes bulb planting, and in some other respects it's the opening of a new year. Of course with the browning of some leaves and the taking up of the "spring" blooming bulbs it seems like fall, but the next year's work in the ornamental garden should be well planned this month.

But first, keep the lawn and trees well irrigated this month. Last winter's rains are gone down so deep that no plant reaches them, so that neglect to apply water may result in permanent injury. Even if leaves are dropping the tree needs moisture at the root. Valuable plants are lost because of withholding all water at this period.

Water the roses heavily, also fertilize them if you want Christmas bloom.

Chrysanthemums will soon be in their glory. Fertilize and water heavily. Golden glow and goldenrod are blooming profusely. Plan for larger beds next year.

But the bulbs. Order some new ones this year. Watsonias are wonderful flowers and not expensive. Planted this month they will bloom in April, and their sword-like leaves are handsome the winter through. They boast "the whitest flower that blooms," and it's a beauty.

Iris may be divided this month. So many new varieties are offered by growers that no names will be mentioned, but any iris is handsome and some are handsomer. In addition to the more common German varieties try a few of the Spanish and Japanese types. The former are cheap; the latter cost money, but they are worth it.

Don't forget our California Humboldt lily. All seedmen handle it, or it may be found in almost any mountain canyon if you'll only dig for it.

Sow eucalyptus and cypress seed this month for trees for next spring's planting.

Start violets and plant pansies. Use fine rich soil in flats or boxes and keep moist. It is in order to plant almost all annuals, especially California poppies. At least gather the seed for poppies this month.

Water freely the poinsettias which will be in bloom in a couple of months.

Clean up the weeds and rubbish. Don't burn it, but pile with leaves and all kinds of rubbish and a little dirt, then keep wet. Next year it will make fine potting soil.

THE AUTO CLUB

Written for California Cultivator

By Gordon Gassaway

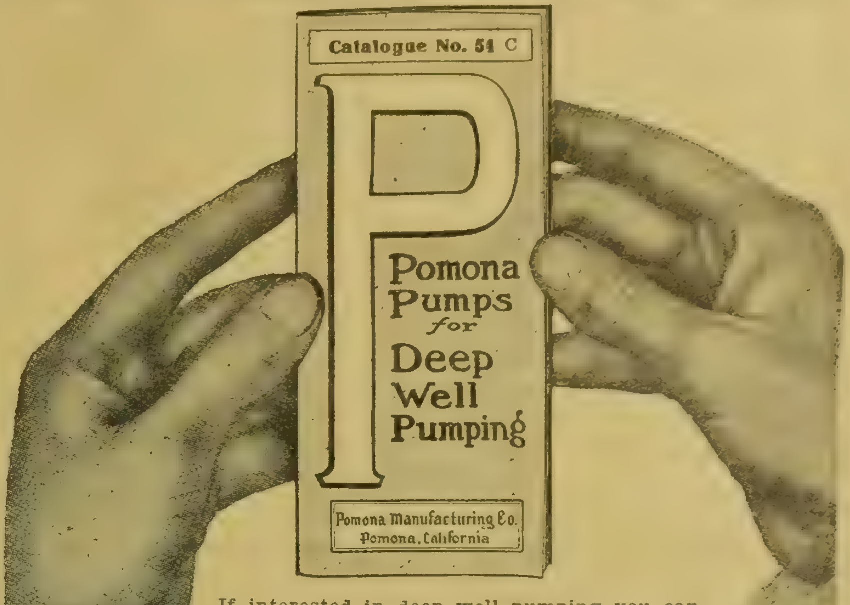
What is the Automobile Club of Southern California doing for the state? That is a question which motorists south of the Tehachapi have answered by seeking membership in the organization.

To the agriculturist the auto club is an asset, and its name appears upon the profit side of the book. Twenty years ago the blushing beet was carried to the urban markets over country lanes by good old Dobbin. Today the farm produce is carried to the cities over macadamized roads, for the most part, and in many instances by the motor truck, while Dobbin munches grass out in the back pasture. Good roads did not always exist; there had to be incentive, and this was found in the advent of the pneumatic-tired automobile—and the united efforts of the organization which has become known as the Automobile Club of Southern California.

Within the last six months the Auto Club has added more than 1300 members to its roll. This is a significant step in its campaign to reach a total of 10,000 members by 1915, and 45,000 by 1920. To unite all of the motorists in Southern California into a single body for the promotion of good roads and the maintenance of a comprehensive sign-post system, is the plan of Secretary S. L. Mitchell. With this announced intention to the present membership, each active worker has been engaged in seeing that his friends are proposed for joining the ranks. Present members are rapidly taking this campaign into their hands and are bringing the total up to the desired 10,000.

Actual accomplishments for the state by the club have been many. A signpost system reaching across the continent to California from Kansas City is being erected by the club. This system will point the way west to thousands of motorists in 1915. Better legislation has been outlined by the club for the good of motorists and for the improvement of roads. Around the club has circulated an activity which could not have been started by any organization other than one of motorists.

Motorists are of all localities, and the Auto Club has found, according to Secretary Mitchell, that the suburban automobile owner is usually most active and most enthusiastic when it comes to boosting for new roads and boulevards.



If interested in deep well pumping you can have a copy of this book by writing for it. It contains information about the POMONA DEEP WELL PUMP, and also valuable data on irrigation subjects. When writing ask for "Catalogue No. 54 C," and state the depth of your well and its location.

The Pomona Double Action Deep Well Pump

is of the plunger type with reciprocating plungers, traveling in opposite directions, the one with a slow up-stroke, the other with a quick down-stroke, and a substantial "lap," thus having the descending plunger in place ready to receive and carry its load before the ascending plunger has reached the end of its stroke, traveling a substantial "dead" distance together, the one receiving, the other giving up its load gradually. Cylinders, valves and all other parts are made of the best materials that money will buy, and are built to stand up under heavy deep well lifts and to give years of satisfactory service.

Pomona Pump Oil

is a pure Pennsylvania product, refined especially for our particular use, and should always be used in connection with Pomona Pumps. If you require a thoroughly reliable lubricant, write us for prices and further information.

Pomona Gates and Valves

are made by us in a complete line of sizes for use in cement pipe irrigation. Special valve catalog "C" will be sent free on request.

Pomona Mfg. Co. Pomona, Cal.

International Harvester Tractors Solve Farm Power Troubles

MAKE a note of a dozen of your hardest and most troublesome farm operations and you will find that International Harvester oil tractors—Mogul or Titan—can be used with profit in all.

They furnish reliable power for all belt machines and for disking, plowing and other drawbar work. Features which make I H C tractors valuable are the truck design, the large mainshaft and its long bearings, the power starting system, the dust-proof engine—features of proved value which you find on all International Harvester tractors.

I H C tractors, Mogul or Titan, are simple, strong, and easily operated. They are built in all sizes, 6-12 to 30-60 H. P., and in styles to meet the needs of every farm. Be sure to see especially, the lightweight 12-25 Mogul, built for the small farm. This machine, equipped with our new self-steering device is a marvel of labor saving.

Write us for catalogues and other information about I H C tractors and engines.

Choosing a Tractor for the Farm

Written for the California Cultivator

It is easier to make a mistake in getting too small a tractor than too large a one. Such a mistake results largely from looking first at the question of the cost of the tractor rather than the question of the results to be secured from its use.

The size tractor that every farmer needs is not the tractor that will enable him to do his work in the way he is now doing it, which in the majority of cases is not the way in which farming should be done to raise the biggest crops, but the size tractor which will enable him to do all of his work in the right way and at exactly the right time in order to raise the largest crop possible.

Definite experiments have been made which show that to increase the depth of plowing from one-half to double the usual depth, will greatly increase the crops. Deeper plowing results in a better root bed for the plant. It increases the food and water supply. Probably the most accurate tests of the importance of deep plowing have been made by the Kansas state agricultural college. By increasing the depth of plowing from three inches, which they say is "common practice among farmers," to seven inches, it was found that the increased depth gave an increased yield of six and one-third bushels per acre in a three-year average.

Experiments made by the University of Wisconsin show that to double the depth of plowing, requires an increase of 70 per cent in power. Plowing in the early summer when the ground is hard likewise demands more power.

These facts should be given first consideration in determining the size of tractor which will be the most profitable one to buy. One should select a tractor of sufficient size to be able to plow in hard ground and plow deep, and not a size with only enough power to do the work in the way it is now being done.

Furthermore, it is not only important to have sufficient power to plow in hard ground and to plow deep, but to have enough power to do all of the farm work at the time when it should be done.

In fact the question of timeliness is of such great importance in the matter of increased crops that one of the farm papers places it first in point of importance, saying that "timeliness or doing things at the correct time is the keynote of the problem of cultivation."

It is also important to remember in this connection that overloading a tractor is a serious mistake, just as is overloading a horse. In the first place, where a tractor pulls only the load which it is designed to pull, the slippage is but small, but when it is overloaded the slippage increases at a rapid ratio. Furthermore, overloading not only rapidly decreases the pulling power, but also rapidly increases the liability of breakage, resulting in serious loss of time, while the tractor with the normal load for which it is intended will be able to keep working steady at it right along and in the end will do far more work than an overloaded tractor.

These are the first three factors to be borne in mind in choosing the size tractor that will result in your getting the most increased profits—first, get a size tractor that will produce enough power to do the work in the best possible way. Second, get a tractor that will produce enough power to do all your work at the time when it should be done. Third, get a tractor with enough power to do the work in the right way and at the right time and do it when pulling a normal load and not an overload.

It will surprise a great many people also to know that a larger size tractor is in most cases the most economical—that it will not only enable the purchaser to produce bigger crops, but at the same time will enable him to produce those crops at less cost than with a smaller size tractor.

Prof. I. W. Dickerson of the University of Illinois has presented this phase of the matter more completely than we have seen elsewhere. In his article, Prof. Dickerson compares the operating cost of a medium-size tractor and a small-size tractor on a 140-acre farm. These are the figures which he gives:

Medium-sized tractor, 140-acre farm:

Interest on $1800 for one year at five per cent	$ 90.00
Depreciation on $1800 for seven days, counting eight years life of 40 days each	39.38
Wages, seven days, at $2.25	15.75
Fuel, 25 gallons kerosene per day at eight cents	14.00
Oil, grease, repairs, estimated at $1.50 per day	10.50
Total	$169.63
Deduct driver saved for harrow four days, at $1.50	6.00
Total cost	$163.63

Small tractor, 140-acre farm:

Interest on $750 for one year at five per cent	$ 37.50
Depreciation on $750 for 18 days, counting eight years life of 40 days each	42.19
Wages, 18 days, at $2.25 per day	40.50
Fuel, 15 gallons kerosene per day at eight cents	21.60
Oil, grease, repairs, estimated at $1.00 per day	18.00
Total cost	$159.79

He then says: "The most surprising thing about this latter case is the very trifling advantage of the small tractor over the medium-sized one, considering the fact that the farm in question is less than a quarter-section. It is probable that the greater suitability of the medium-sized tractor for ensilage cutting, shelling, etc., would wipe out even this small margin. It would seem to be clearly indicated that the two-plow tractor is not as economical as a larger outfit for the average general farm."

It should also be noted clearly that with the small tractor it required 18 days to do the same amount of work as was done in seven days with the medium-size tractor, and that while in the end the cost with the small tractor was practically the same as the cost with the large tractor that, because of the greater time required, there should undoubtedly be figured against the small tractor, the fact that the crops produced would be lessened on account of the work not being done at the proper time. Prof. Dickerson also does not figure in the further fact that the overloading of the small tractor, which one is inclined to do when he does not have sufficient power, results in decreased length of life and increased yearly repair bill. When all of these factors are taken in consideration—the first mentioned by Mr. Dickerson that the medium-sized tractor can be used for many additional kinds of work; the second, that because of the fact that with the small tractor the work cannot be done at the right time and the crops will thereby be reduced in size, and the third that the overloading of the small tractor will result in decreased life and heavier repair bills—when all of these factors are considered, it is plain to see that a larger size tractor is more profitable and more economical than a smaller size which would just enable a man to do his work in the ordinary way by stretching out the time and by overloading the machine.

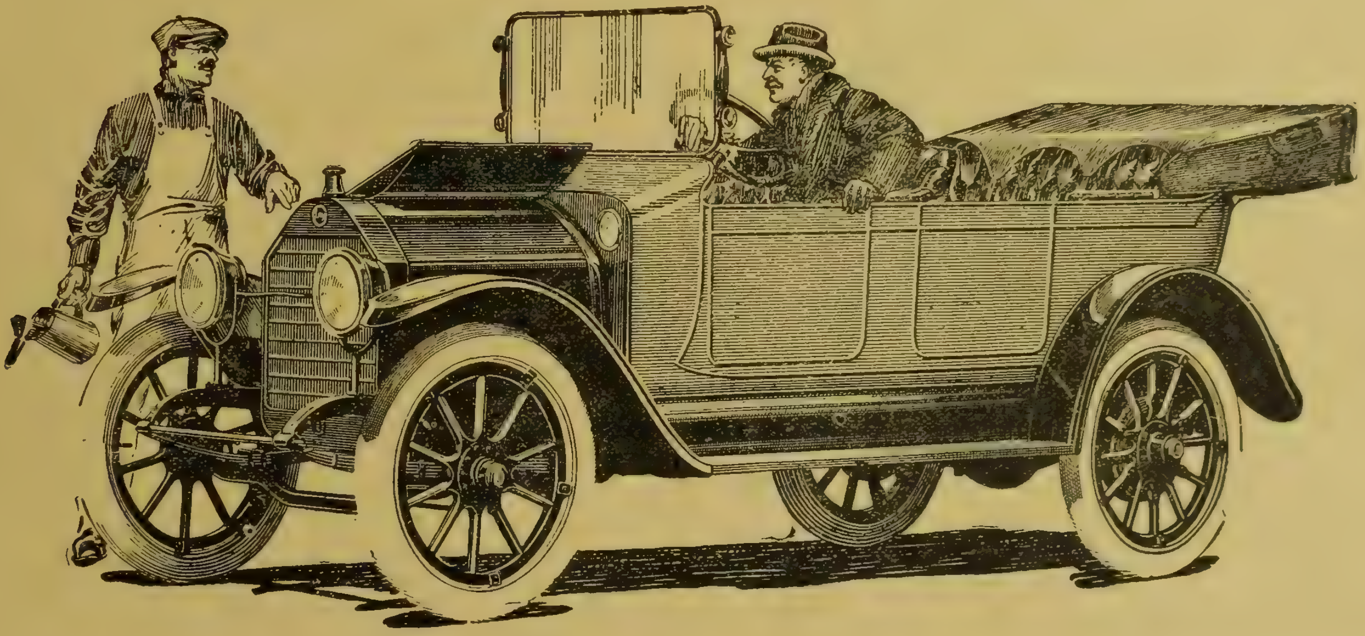
Jeffery

The Mark of Quality

The Jeffery "Four"

$1575.00 Los Angeles

There are many reasons why you should buy the Jeffery Four, each one of these reasons is a point of superiority. Buy quality, not quantity. Buy a motor car on what it is, not what it is claimed to be. Buy service and stability, coupled with merit and appearance.



Read Carefully What We Have to Say Below. A Few Reasons You Should Buy a Jeffery

Motor car buying today is receiving closer and closer attention than ever before in the history of the industry. It is natural that everyone wants to own a motor car, but the fact that it is a motor car does not satisfy as it did in years gone by. The public is educated, first in the car itself—appearance, finish, style—second, in the quality of material that goes into the construction of the car, and, third in the factory that is turning out the finished product.

The automobile industry has seen very many changes in the past few years. First the cry was for power—power—and more power; then came self-starters, electric lights, etc., and the factory that could put out an automobile with one of these up-to-date features ahead of its competitors naturally gained lots of publicity.

The Jeffery Factory, who have been building things on wheels for the past forty-three years—and who certainly should know how—are becoming recognized as leaders, and their ambition is to be the fashion plate of the automobile industry. One year ago they introduced to the American public the high-speed engine and the flexible leather coupling. Today all automobile talk is on the high-speed engine, which Jeffery was wise enough to see was the coming engine for automobiles. He put this high speed engine into a frame and built around it the now famous Jeffery Four, which has made such remarkable strides throughout the whole of these United States. Every piece on this car, from the steel of which it is composed even to the last coat of varnish, is the highest priced that money can buy. No one questions the quality or merit of Bosch ignition, Rayfield carburetor, imported ball bearings, and last, but not least, the highest priced self-starter that has yet been produced—U. S. L.

All of these high grade materials spell economy in up-keep, and economy is the one question that vitally interests every one of us. Think of a car, if you can, as roomy and as luxurious as the Jeffery Four, that will actually travel up to 24 miles on one gallon of gasoline; that will travel upwards of 600 miles on one gallon of lubricating oil; that will coast on the level ground a distance of one-half mile.

Send us a postal card with your name and address and we will be glad to mail to you a catalog which will give in fuller detail the description of this beautiful motor car.

—they bought over 1000 acres of Milford Valley Lands on sight—this excursion party of practical Southern California ranchers and investors!

STUART

Chas. Kyme, Santa Ana; F. Nibali, W. M. Blair, W. Van Hire, Brawley; W. F. Nixon, J. L. Roberts, J. B. Roberts, Imperial; G. A. Swan, El Centro; Purdy Hart, Holtville; R. E. Stuart, Filmore; D. H. Doster, Peter Niboli, San Diego; C. A. Bingham, Long Beach; F. A. Bemans, Brawley; A. H. Bryson, Los Angeles; E. E. Bennett, El Centro; F. A. Clark, Los Angeles.

When practical, successful ranchers like these buy over 1000 acres of farm land on sight, you can depend on it they've based their judgment on mighty substantial evidence. These men **saw** Milford Valley lands—they didn't ask for promises and predictions.

$30 An Acre Cash

Under Gravity Irrigation System.
Perpetual Water Right is Yours for All Time to Come. $70 Per Share—
12 Years' Time for Payment If You Wish.

Adjoining Milford, Utah—on Main Line of Salt Lake Railroad.

They saw field after field of alfalfa that will net $70 or more an acre—three cuttings. They saw prize-winning potatoes, 400 to 500 bushels per acre, average yield—luxuriant stands of oats and wheat—fine stretches of green garden—trees heavy to breaking with luscious pears, apples, peaches. They investigated the great gravity irrigation system that waters the Milford Valley lands—they saw an abundance of water for all time to come and were astonished at the exceptionally low cost of water maintenance (which should not exceed 25 or 30 cents per acre per year). In a word, they found soil, water, climate, markets, railroad facilities, social and educational advantages **even better** than we had promised.

Past experience in judging farm land values taught them that the value of the land, now selling at $30, would be $200 an acre and up when under cultivation. Write or call for free illustrated booklet. Special excursions at low homeseekers' rates, Wednesdays and Saturdays from Los Angeles.

HOW TO GET LONG MILEAGE

By F. A. Henderson

Two factors contribute to the life of a pneumatic automobile tire; the first is a tire well made and of good material; the second is the tire care necessary to secure from this tire the mileage which its maker has already done all he can to make maximum. The tire is purchased by a dollar-and-cents consideration; tire-care needn't be purchased; it's available to every motorist who cares to apply it. And that it pays and pays big is what every motorist who has tried it knows.

All-important is the air pressure carried. It is just as important as the tire containing it. It preserves the body of the tire—its fabric. Next in importance is the care of the tread—the tire's protection. These two precautions prevent the more common causes of tire trouble. Having observed them and made maximum mileage a possibility, the motorist will wish to go farther and make it a certainty. To discuss the means of reaching this end, is the purpose of this article.

The most damaging wear to which a tire can be subject is what it receives when used on a wheel that is not running parallel to its mate, a condition designated by "wheels out of true." This occurs on the front wheels. An accident, improper adjustment of steering apparatus, or even hitting the curbstone diagonally, may throw the wheels out of line so that they point inward or outward, as the case may be, instead of paralleling each other along the road. Tires used on wheels in this condition instead of rolling over the ground with a minimum of friction as they should, are compelled to slide over the ground diagonally, the sidewise component of this motion grinding off the rubber from the tread as effectively as an emery wheel.

The remedy for this trouble is obvious; straighten the wheels. Any garage man can do it. Before beginning a trip, the motorist usually inspects the machine to see that everything is in good shape. Extending this inspection to the wheels will quickly detect any such condition. This can be tested approximately by adjusting one of the front wheels so that when you kneel down in front of it and sight back, it just lines up with the rear wheel on the same side. The other front wheel then ought to line up with the corresponding rear wheel. If it doesn't the wheels aren't true. A more exact method is measuring with a tape line the distance from the inside of the rim on the wheel on one side to the inside of the rim on the wheel on the other side, using points at a distance from the ground equal to the height of the hub. The distance in front of the axle ought to equal the distance behind; if it doesn't, the wheels aren't true.

In the same way, a demountable rim put on crooked or the end of an axle bent, causing the wheel to wobble, will wear off the tread too rapidly.

A peculiar property of rubber due indirectly to its elasticity, is that it can easily be ground or filed, while if simply rolled over even a rough surface—the treatment a tire ought to receive when in service—it will last almost indefinitely. For this reason, suddenly locking the brakes and sliding or skidding the tires, will in a few feet distance wear them as much at one place as several hundred miles of service. It doesn't pay to lock the brakes anyway, for they are most effective and stop the car quickest when the wheels, instead of sliding, still grip the road. As locking the brakes therefore is a practice with nothing to recommend it, the importance of avoiding it can't be too strongly emphasized. It's also well, frequently to make sure that both brakes are binding equally, for if they aren't, the wheel with the tighter band is bound to wear out its tire too soon.

Speeding and the use of stone roads wear the tires faster than moderate driving on sandy roads. It pays to avoid the road with deep ruts. The sides of the ruts chafe the tire's side walls and lay bare the fabric.

Similarly, driving in car tracks or against curbs centers the wear on the side of the tire. The remedy is simple—avoid car tracks and curbs.

Sometimes the fender becomes loose so that as the car passes over bumps the fender is urged down so that it gouges into the tire. This soon cuts the tire at the place the metal fender hits it as the tire spins around. To avoid, simply make sure nothing touches the tires as they revolve.

It also goes without saying that oils and grease are to be avoided. They act chemically on rubber and cause its rapid deterioration.

GOOD CARE IS ECONOMY

I have owned a touring car for the past seven months. It had been driven 4000 miles before I bought it and I have driven it about 6000 miles since. Formerly it had very rough usage, but I gave it good care and no one else ever drives it now. It has done hard work over bad roads and with heavy loads, and has not needed repairs yet. On rainy days when it is too wet to work outside you will find me in the garage looking over my car, testing the engine and putting a bit of oil around the spark plugs or wherever needed.

If I find any tendency to leak compression I make a thorough mixture of one-half white lead and one-half graphite, and after unscrewing the spark plug I fill the threads of the screw with this mixture, as well as the threads in the cylinder head into which the plug screws. Then I screw in the plug, leaving it for a few minutes to set before running the engine. In this way I have always been able to stop all leaks in any part of the engine.

Testing the Spark.

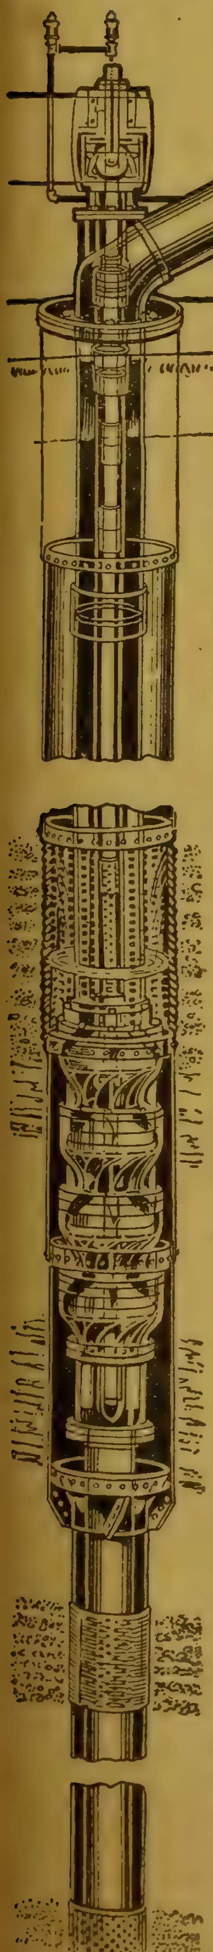
I then start the engine and see if it runs evenly at all speeds without pounding or missing an explosion. At times, if you will put on the brake and make the engine pull, you will notice that one cylinder doesn't give as loud an explosion as the other three. This is because one of the plugs doesn't fire as it should, or perhaps there is a short circuit in the wire somewhere.

This can be found by disconnecting one wire at a time from the plug, then start the engine on—three cylinders and hold this wire near to the plug from which it was taken, drawing it away repeatedly to see if it has a good spark and how far it will jump. Continue in this way until you have tried all of them. If you find one that does not give as strong a spark as the rest, change the plug, putting one of those already tested in its place.

If the second plug gives a good

Produce Cheaper Water

The Pump of the Century



The Layne & Bowler Pump

produces the maximum capacity of water at the very lowest cost. It has been proven under the most severe tests that this pump will work successfully under all conditions. It is an absolute protection against an insufficient water supply.

No Pit Required

All adjusting is done on top of ground. No intricate mechanism. All working parts enclosed. Perfect lubrication system. Unaffected by sand. Built for the particular requirements under which it must work. Absolutely guaranteed.

Everyone interested in irrigation should have our illustrated Catalog No. 30. It tells all about this pump. Write for it today.

Layne & Bowler Corp.

900-910 SANTA FE AVE.
LOS ANGELES, CAL.

spark you may know that the original plug was defective; if it does not give a good spark, the trouble is probably in the wiring, though if dash coils are used it may be located there. In that case change them by substituting one that is out of order, then try the spark again. In this manner I have always been able to locate the trouble.

Look Up.

It is well to get under your car, lie on your back, and look at every working part to see if there isn't some burr just about ready to come off. If anything of that kind should happen when on the road it would cause much trouble and perhaps an accident. I have found them loose on my car a great many times, and had I not discovered the danger when I did they would have caused serious break-downs.

And break-downs mean repair bills—and the man that has those is the man that doesn't spend his spare time in the garage inspecting his car. For the same reason he doesn't know how to put the repair on when he gets it, and either must waste a large amount of time puttering with it—just when he is most anxxious to use the car—or pay the repair man more than it cost in the first place. Had he spent one hour a week on his back under the car he could have avoided all this disappointment and expense.

The same is true of tire troubles, which can usually be prevented by looking over the tires carefully every few days when in use. If there is a weak place that looks as though it might cause a blow-out before long, I take the tire off and put in a blow-out patch; or a re-liner is a fine thing to use when the casing is worn, and this with a blow-out patch over the outside will make it almost as good as a new tire and affords a wonderful discount on tire expense.

In manipulating the spark and throttle I always try to advance the spark all it will stand without hammering. If possible I give the car a run for a hill—providing there's no ditch or culvert at the bottom. Never drive a car slowly until the foot of the hill is reached and then try to pick up speed while mounting it. for that is a strain on any engine and will soon ruin it. The spark should not be advanced so much on a hard pull or when going up hill as it is on the level. I save a great amount of gasoline by advancing the spark when the engine is not working hard, but even then it can be advanced too much.

Saves Time and Money.

I have found the auto a very useful machine on the farm; it saves both time and money. If you live a long way from town it takes all day to go to town and back with a team, and that means one day's work lost in the field. And it doesn't take many such days in harvest time to knock one out of the price of a medium-priced car. If your binder breaks down and you have to go to town for repairs, you can make the trip in one-tenth the time it would take with a team. Besides, it gives pleasure to the whole family. There is nothing like an automobile for keeping the boys on the farm.

Everything considered, I cannot see that there is any more profitable investment. My neighbor told me the other day that he didn't think he could farm any more if he had to do without a car, and said he believed that in a few years people wouldn't live on a farm without one. And I feel the same way about it; I surely would not do without a car, no matter what my business.—S. W. S. in Nebraska Farmer.

PIGS IS PIGS

California farmers are furnishing to California packing houses only some five or six per cent of the hogs required. California is importing from eastern states many millions of dollars' worth every year of pork and pork products. California farms and climatic conditions are favorable to pork production. California is not a corn growing state, but it is a barley growing state, and barley makes a finer pork than does corn, and California has barley to burn.

Hog cholera is probably the cause of the discouragement which swine raisers have felt, and which has resulted in the reduction—for there has been a reduction—in pork production. The east has nothing on us when it comes to hog cholera, but the eastern farmers seem to be more persistent in overcoming it and are producing quantities of pork. For several months the quotations on live hogs have been marked up. It is not probable that they will remain at the present high price indefinitely, but with barley and alfalfa people begging for purchasers for great quantities of hay and grain on hand, why are we not feeding it to our own stock?

PILING UP WHEAT

Every shipping port of the country is now receiving vastly more wheat than can possibly be sent to the foreign markets which are asking for it. We have this year produced nearly a billion bushels, or 242,000 above the average for the past two years. After each American has taken out his five and a third bushels, which is said to be our average per capita consumption, there will be still about 250,000,000 bushels for export. But the hungry world is unable to get it and will be until we can adapt our shipping to the new conditions. It is to be hoped that the European war will result in one thing, and that is the putting of America on a little more independent basis.

WORKING AGAINST NO. 3

Farmers of the Sacramento and San Joaquin Valleys made up excursion trains to San Francisco and other bay polling places on Tuesday, August 25, and paraded from one precinct to another, carrying circulars showing wherein Proposition No. 3 would prove a menace to laboring people in cities as well as in the country. In one particular it would certainly strike the city laboring people, and that is in the increased cost of farm products. The increase will not be entirely caused by the restricted hours, but because the restriction will prevent making the most of many farm products when they are at their best. The losses on many farms cannot help but be great under this measure.

THE FIRST VESSEL

Los Angeles united in honoring the first vessel which passed through the canal and landed a cargo in a California port. Last Saturday the Missourian entered Los Angeles harbor and she was presented with a silver service by the city of Los Angeles. The effect of the war on the commerce of the world will prevent the testing of the value of the Panama canal as soon as we had hoped, but the coming of this vessel is the forerunner and we believe a promise of wonderful advancement in California's interests. If California will now prepare to give to our merchant marine, which we hope will be created, the goods to carry, we believe means will be provded ultimately for their carrying.

EIGHT-HOUR STICKERS

Every farmer who is convinced of the necessity for voting down the eight-hour proposition, which is Number 3 on the ballot to be submitted to voters on November 3, should write Farmers' and Fruit Growers' Federation, 740 Consolidated Realty building, Los Angeles, and ask for little gummed stickers for putting on the back of every envelope sent out between now and election day. These may be had for the asking. The text of the sticker is, "I ask you for continued prosperity to vote 'No' on Proposition No. 3, the eight-hour law. You help! Send for and use these stickers! Address Farmers' and Fruit Growers' Federation, 740 Cons. Realty Bldg., Los Angeles."

We haven't seen it suggested elsewhere, but why would it not be a fine slogan to use from now until election day: "On Nov. 3 Vote 'No' on No. 3?"

STATE CONVENTION

It is too early to say much about the program of the coming state fruit growers' convention, but Dr. Cook informs us that there already have been enough acceptances to his requests for addresses to be made at that convention to give assurance of one of the finest conventions ever held in California. Much talent from the East has already been promised and Californians are entering fully into the spirit of it. The local committee at Los Angeles, where the convention is to be held, has secured the place of meeting, arranged for headquarters and is making every plan for the comfort and pleasure of the guests. Within the next week or two we will give more definite outline of the good things of the convention.

THE AUTOMOBILE

With only one or two states of the Union ahead of California in number of automobiles and none equalling her in number of self-propelled vehicles in proportion to population, California is able to do business more swiftly than any other section of the country—and she does it—for we believe that farmers and others in this state accomplish more in proportion to their capital and acreage than in any other state in the Union. For that reason the automobile or any other form of power farming is sure to increase in popularity.

Probably the greatest service the automobile has given to California is the securing of the construction of good roads. Whether the farmer owns a self-propelled vehicle or not he is sure to be interested in getting his produce to market with the least injury from dust, bruises and wilting possible, and California good roads have aided wonderfully in this particular.

There has been much prejudice against this machine, but it is gradually disappearing, and we believe that as its usefulness is more appreciated the state will advance with greater strides. There are now in this state more than 116,000 automobiles.

PRIZE PHOTOS

A couple of weeks since we expressed a desire for a number of photos for use in our columns, and to give a bit of spice to collecting them we offered prizes for the best which would be sent in. Though only about one week's notice was given, a fine collection was offered, and from them we have selected four, which appear on page 237. We believe that this contest, which will be continued for a few months at least, will bring in many attractive photographs of Pacific coast farm life. Though only four photographs are used in this issue, more than a score of others which are exceptionally fine will be printed in later issues of the Cultivator. We hope the next contest, photographs for which must be in our hands by September 24, will be even more spirited than this one has been. As before, the prizes will be $2 and $1, and for the next five who send photographs of sufficient clearness and of enough interest to answer for illustrations, a year's subscription to the Cultivator.

Another contest for prizes which will result in many valuable hints is explained on prize photo page. It will be of particular interest to women readers.

Agricultural News Notes

The National Dairy Show will be held in Chicago October 22-31.

Tin has more than doubled in price since the outbreak of the war.

The acreage of hay in Ireland is considerably more than twice as great as the acreage of all other farm crops combined.

The South American market is being canvassed by the Northwestern Fruit Exchange. Deals involving over 30,000 boxes of northwestern apples already have been closed.

An inferior crop of olive oil is expected in Syria this year; less than half a crop is expected in the Seville district of Spain; the prospects in Italian north Africa are very good.

Wood pulp to the value of two and a half million dollars was brought into the United States from Christiania, Norway, last year. This is the largest export Norway makes to this country.

Four public markets for the sale of food stuffs direct from the producer to the consumer were opened September 1 by the city of New York to combat the increased cost of living, since the war broke out.

Many business houses, offices and banks of the Middle West were closed during the latter days of August while the business men went out into the harvest fields to help the farmers handle their bumper wheat crop.

Our import trade for 1913 was approximately fifty and a half million tons; our export trade practically an equal amount. Of this 94 per cent was carried by vessels sailing under foreign flags. Hence the activity of congress on the shipping problem.

Department of justice agents, it is said, have discovered that packers are shipping a large quantity of meat across the Canadian border. At the same time the prices on meats are advancing. Department officials are at a loss to explain how the packers can export meat and still plead that there is a shortage. The packers will be given a chance to explain.

For the purpose of improving the breed of cattle in the Pacific Northwest, some important purchases of English cattle have been made there for James J. Hill. One shipment is of 50 dairy Shorthorn bulls, which will be given away to as many counties in that section of the country. Each one of these bulls is born of a cow with a milk record of 10,000 pounds.

An apple crop of 210,000,000 bushels is forecasted by the department of agriculture. That is about 65,000,000 bushels more than last year, but 25,000,000 less than in 1912, and about 4,000,000 bushels less than in 1911. The apple crop in several western states is estimated: New Mexico, 900,000; Arizona, 100,000; Nevada, 200,000; Idaho, 150,000; Washington, 7,600,000; Oregon, 3,300,000; California, 5,300,000 bushels.

Owing to the drouth from Calgary south to the international line the wheat and oat crops are not very promising, and judging from present conditions the yield will not exceed one-half of last year's crop. The same statement applies to the southeastern part of Alberta, but east of Medicine Hat, where rain came when most needed, the indications are for 65 per cent of a crop. The southern part of Alberta is badly in need of rain, as the excessive heat is burning up the fields.

Agricultural News Notes of the Pacific Coast

Northern California

The St. Helena vintage festival will be September 4-7.

Oroville sheep men are making the regular fall clip of wool.

The Alameda County fair will be held at Pleasanton, September 23-27.

The harvesting of almonds is in full swing at Orland, Glenn County.

Placer County expects to market this year about $72,000 worth of hops.

Sutter County vineyardists will harvest their largest grape crop this season.

Newcastle is anticipating the establishment of another big gold dredger.

Napa Grange Patrons of Husbandry recently met and discussed the eight-hour bill.

Alameda County is the latest with a farm adviser, S. H. Nixon having been appointed.

Directors of the Napa County farm centers met recently at Napa and organized a farm bureau.

All packing houses of Sebastopol, Sonoma County, are running full handed on Gravensteins.

Material extension of the good roads will be made in the Sacramento Valley during the next few months.

Vacaville, Solano County, has shipped 623 cars of fruit, as compared with 628 cars last year, same date.

The first annual show of the Sacramento Poultry Association will be held in Sacramento November 2-7.

The management of the university farm at Davis is planning for short courses which will begin in November.

Sacramento County is planning to fight coccus citricola in its citrus producing section, and Deputy Horticultural Commissioner Weldon is cooperating with the county horticultural commissioner in planning the work at Fairoaks.

Central California

Tulare creameries paid out nearly $70,000 last week.

Dinuba's first car of cured fruit for 1914 was shipped last week.

Turlock has shipped 126 carloads of watermelons and 183 of cantaloupes.

All the fruit canneries at Visalia are running full handed and overtime.

The Associated raisin stemmer is in operation in the warehouse at Reedley.

Western Fresno County Malaga grapes are selling for $19 and $20 per ton.

The Associated Raisin Company has named prices on the coming season's output.

Dinuba is discussing the growing of sugar beets to send to the Visalia factory.

Many herds of dairy cows have replaced the herds of beef animals of Chowchilla.

Fresno shippers are planning to ship a cargo of 10,000 tons of dried fruits direct to Europe.

The creameries at Hanford, Kings County, paid last week to dairymen in excess of $30,000.

Fumigation operations are becoming more general all over Tulare and Fresno County citrus sections.

Modesto irrigation district's issue of bonds to the extent of $610,000 has not yet been sold because of lack of bidders.

During the hottest weather some of the hay growers at Newman, Stanislaus County, made hay while the moon shone.

Active work on the Hetch Hetchy proposition has begun and San Francisco anticipates a greatly increased supply of water.

Fumigators of Tulare County have been assured that they will be supplied with sufficient cyanide of sodium to finish this season's fumigation.

Southern California

Imperial Valley is using the hopper dozer on its grasshopper pest.

California is the second largest apple producing state in the Union.

The Hemet Valley of Riverside County claims a fine crop of apples this year.

Escondido is making plans for a great celebration on Grape Day, September 9.

Yucaipa Valley apple growers are working on plans for their annual apple show.

Sweet potato growers of the Anaheim section have organized a marketing association.

Shipments of citrus fruits from Highland, San Bernardino County, totalled 2,210 cars.

Orange growers of Pomona received their final checks on the season's shipments last week.

Fumigation tents in practically all the orange sections of California are in active operation.

Riverside County fair will be held October 6-10. There will be trotting on each day of the fair.

The International Fruit Products Company has its plant at Riverside ready for operation.

The Indians of the Pala reservation in San Diego County will hold an agricultural fair September 2-6.

Orange County lima bean producers are receiving about $6.25 per 100 pounds for September delivery.

An Orange County potato grower near Huntington Beach has a record of 195 sacks of spuds to the acre.

Orange County reports its walnut harvesting operations as practically three weeks in advance of the usual season.

Imperial Valley is receiving $12,000 per day more revenue for its butter than last week because of advance in quotations.

The Coast

Alfalfa is selling at $12 per ton in western Montana.

Yakima, Washington, has shipped 560 carloads of fruit to date.

Northern Idaho hay crop will run about 90 per cent of normal.

Eastern Washington reports practically all of its grain crop in stacks.

The Northwest Fruit Distributors is shipping far more fruit than one year ago.

The San Luis valley of Colorado will feed about 400,000 head of sheep this season.

One thousand sacks of grain were recently destroyed at Logan, Utah, by a cigarette fire.

Intense heat in the section of Silverwood, Oregon, has been modified by liberal showers.

Thousands of men are fighting fires in a line 44 miles long in Montana and northern Idaho.

Managers of the fair at Willcox, Arizona, are planning for the finest fair to be held this fall.

Farmers at Chandler, Arizona, united with the merchants' association and held a picnic last week.

Strawberry Valley, Utah, will soon establish an irrigation system, waters being taken from the Weber River.

Eastern Washington reports apples ripening earlier than usual and the entire crop of exceptionally high quality.

Live stock men of the Salt River Valley have suffered great loss this year because of hunters shooting stock.

Several California alfalfa growers have been buying largely of Utah live stock to bring to the coast for fattening.

Fruit growers of Cache Valley, Utah, met recently and discussed methods of disposing of the coming crop of apples.

John Deere Deep Tilling Stag Sulky

Made Especially for Deep Plowing. Extra Heavy Beam--Extra High Bottom

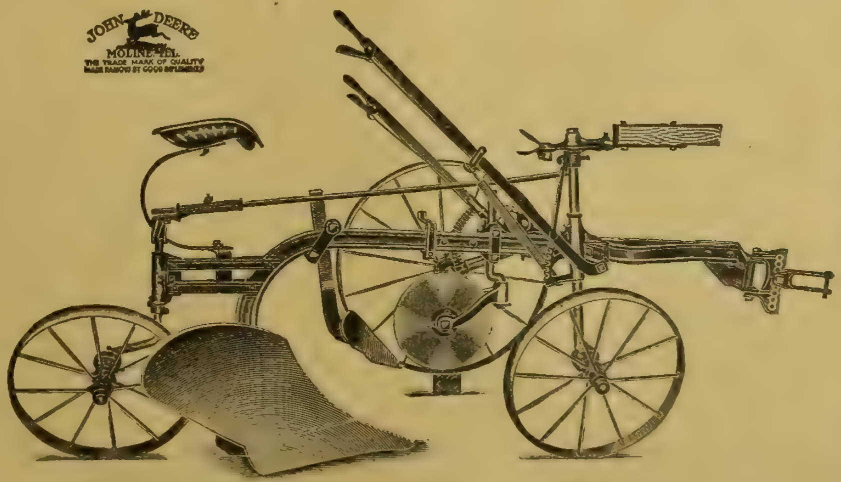
The Plow that is built to stand the strain of deep plowing.

Makes a furrow 14 inches wide and 14 to 16 inches deep.

In hard soil it does not throw up big chunks.

Covers all trash.

Equipped with jointer as well as a rolling coulter.



Made of High Grade Steel and Malleable Iron
Extra Heavy Beam and Clevis
Beam Guaranteed Against Bending or Breaking

Bottom of special shape.

High wide moldboard turns and pulverizes the soil.

Note the Great Clearance. This means that there is plenty of room to prevent clogging.

Wheels extra strong

Furrow wheels, 24 inches Mounted on adjustable axles.

Avoid the Dangers of Stall Feeding

GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine

I want to warn you in time that stock taken off pasture and put on dry feed are pretty apt to get out of fix, because corn, grain, hay and fodder do not contain the laxatives so abundantly supplied in grass.

Some of your animals are sure to become constipated, others off feed, rough in the hair, with paleness of the eyes, lips and nostrils, or the legs may stock or dropsical swellings of the abdomen appear, or the urine may become yellow and thick; but the common ailment of all is worms.

DR. HESS STOCK TONIC

Makes Stock Healthy. Expels Worms.

Being both a doctor of medicine and a veterinary scientist, I formulated Dr. Hess Stock Tonic to correct these evils. It contains a laxative substitute for grass, diuretics to remove dropsical swellings, tonics to improve the appetite and increase digestion and vermifuges to expel worms.

Right now is the time to feed Dr. Hess Stock Tonic, because it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that digests its dinner that pulls on the bit.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that I have authorized your nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

Dr. Hess Stock Tonic is never sold by peddlers—only reliable dealers; I save you peddler's salary and expenses, as these prices prove: West of Rockies: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

Send for my book that tells all about Dr. Hess Stock Tonic—it's free.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

A splendid poultry tonic that shortens the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also helps chicks grow. Economical to use—a penny's worth is enough for 30 fowl per day. West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or keep it in the dust baths, the hens will distribute it. Good alike for horses, sheep and cattle. Be sure to see the name "Instant" on the can before you buy. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c; 3 lbs. 60c. I guarantee it.

Live Stock and Dairy

A FEW RULES GOOD FOR FITTING SHOW STOCK

"Special preparation of animals that are to be exhibited at fairs and shows is absolutely necessary for success," says J. G. Fuller of the agricultural college, University of Wisconsin.

"Stock cannot be taken directly from the pastures and put into the show ring with any legitimate hope of success. Animals that are to compete for prizes should be carefully housed and fed from two to four weeks and groomed a number of times before going to the show. During the day they should be kept in a cool, darkened stable and turned out for green feed and exercise only at night, when flies and insects will not bother them.

"The horse exhibitor should see to it that all of his animals are thoroughly halter broken and easily handled. He should take along plenty of blankets, rope halters, and neat bridles. Horses' feet must be carefully looked after and those of the older animals shod before leaving the home stables.

"Show animals ought to be thoroughly fitted and in good flesh before they reach the fair grounds so that during the fair they may be kept on a cooling ration, thus avoiding danger of sickness from overeating. While at the fair, stock requires at least one hour of exercise a day. This is very essential to insure good health and the wise exhibitor will use the early morning to lead his entries about the grounds."

THE MERRY-GO-ROUND OF PROSPERITY

By Douglas Malcolm

"There are men in my neighborhood," said a country merchant, "whom I call 'endless chain farmers,' while there are others whom I call 'breakers,' the latter so called because I know that there will be certain periods of each year in which they will have a break in their incomes. The first always pay as they buy, while I look out that the second only buy as they pay."

This merchant was not a farmer himself, but he had grown rich doing business with them and he knew the financial standing and the farm methods of every man in his community. In a little speech which he once made he explained his endless chain theory: "Farming," said he, "entails every law of political economy ever mentioned by John Stuart Mills. There is unearned increment, a margin of utility, the law of supply and demand, the manufacturers' profits, consumption of raw material, plant depreciation, and the labor question. Over some of these economic principles the farmer has present control, while over others he has none. He can more or less control raw materials, manufacturers' profits and plant depreciation—in fact, his success as a farmer depends on the way he handles these three factors. Taking the corn crop for example, his raw material consists of his corn and fodder, and his manufacturers' profits are determined by the way his cattle and hogs turn this raw material into marketable beef and pork, and his plant depreciation depends on the disposition he makes of the humus in building up his soil. A farmer who sells his corn as he harvests it, leaving his fodder to shrivel up in the field, who gives no thought to replacing the plant foods which each crop takes from the soil, makes a profit only from his raw material, and when that is sold his income ceases.

"On the other hand, the farmer who saves his fodder, shredding it for the mow or chopping it for his silo, has cheap raw material wherewith to feed cattle and hogs who manufacture it into butter fat, beef and bacon, the sale of which brings in a steady all-year income. These in their turn provide fertilizer which next year makes the soil richer, so that there is more raw material for feed, more cattle and hogs to sell, more money constantly coming in, and so on, year after year. These are what I call 'endless chain farmers.' They are the ones who live comfortably, enjoy farming, and send their boys and girls to college."

Probably the most comfortable farmers of this country are the corn raising farmers, because, as the little black dots on the government map show, they have more hogs and more cattle per capita than the others. There are approximately 100,000,000 acres of corn to be harvested this fall—the richest, most productive crop our country knows—and yet in connection with this harvest there is an equal probability that a fair per cent of the value of this crop will be wasted. Sad as it is, it required centuries to find out that from 30 to 40 per cent of the nutritive value of the corn is in the stalk, leaves and husks, and it has not been learned entirely yet that even without a silo the corn stalks on the farm, when properly shredded, have a feeding value practically equal to timothy hay and prairie grass and a fertilizing value far in excess of either.

All farmers do not have silos, but more and more are seeing the light, and each year thousands of these profit-getting obelisks are being erected. The value of the corn stalk is being widely advertised, but still there are those who do not realize that it is the finest auxiliary roughage when fed with either ensilage, clover or alfalfa, as a balanced part of the grain ration. For instance, in a recent experiment at the agricultural college of Nebraska, it was found that "stover fed with alfalfa returned a value of $4.57 per ton, in comparison with alfalfa at $6.00 per ton as the sole roughage." In another experiment, this time at the New Jersey station, it was found that of 200 pounds of corn stalks fed to a cow during ten days, 60 pounds, or 30 per cent, remained uneaten. This corn was unshredded but carefully harvested. The editor of Farmers' Bulletin No. 107, of the United States department of agriculture series, in summarizing the results, says: "shredding would no doubt result in more complete consumption of the stalks."

In none of these trials, however, has it been claimed that shredded fodder is as good as ensilage, for it is not, but the demarkation line between the two as rough feed for

SANITATION

would have saved a great many of the 7,420,912 hogs valued at $59,455,700.00 lost in United States during 1913 from

cattle is closer than the ordinary believer knows.

In the Pennsylvania station Bulletin No. 83, corn stover and corn silage were compared with two lots of six steers each. They were fed with the concentrates, corn and cottonseed meal. In 126 days of the test the average gain on corn stover was 214 pounds per steer and on silage 240 pounds. The total cost of the corn stover ration was $103.73 and of the corn silage ration $109.91.

Husking and shredding machines will not efface the silo, far from it, but they will efface a portion of the enormous waste of our corn crop, both of silo owners and of others. How great this waste has been can only be conjectured as a whole, but by the acre a pretty accurate calculation can be made. Thus, for example, if the value of the ear corn from an acre of ground amounted to $25, the value of the shredded corn stalk from the same acre would be normally $14.68. Multiply this by every acre of corn left (unshredded) and the amount would be enough almost to support the poor of our big cities.

The average yield of corn stover is between two and three tons per acre. Were we only to allow it one-third of the average feed value of good hay, we should require only three acres of the fodder to equal one acre of hay. Now, hay is one of the most negotiable commodities coming from the field. There is always a market for it, and of late years it has commanded good prices, and yet in nearly every part of the country where shredded fodder has become customary it required a short hay crop to awaken the community to the fact that shredded stover was hay or is hay in everything but the name and reputation.

Selling the hay and feeding the fodder is one link in the endless income. Cheap food and high priced butter and beef is the second link. A third link, so to speak, is in the nature of a rebate. We get back part of what we give. In farming, as in business, we must render unto Caesar what we take from him, and in this case Caesar is the soil. Without going into the detail of soil chemistry, it is sufficient to say that unless we return nitrogen to the field from which we gather our corn crop, our corn yield will grow less each year, just as the wheat yields are diminishing in the prairies.

Stable manure is by far the best natural fertilizer within the reach of the average man, but the way it has been handled would cause a chemist to weep. Liquid manure is laden with gold bearing nitrogen, but to be saved and utilized it must come in contact with something of an absorbent nature. Corn stalks do not absorb at all, many straws absorb poorly, but shredded stover, singularly enough, acts like a blotting paper. It is the king of beddings. It is easily handled, goes through the spreader nicely, and rots easily. It is next year's insurance for next year's income and it does not lessen any the returns for the current year. The signs of the agricultural times indicate to those who can read signs that it is only a matter of time when barnyard humus will be as jealously conserved in this country as it is now in Japan and India, and that the farm in the future without a spreader will be as unique as the farm today without a wagon. The United States Agricultural Department and the

6 lbs. More Butter Fat a Day in 6 Days' Time

—that's what F. T. Shaver of Holtville, Cal., says. Read his letter.

"I wish to send praises in regard to your dried beet pulp. I have fed it for three years, and am glad to state it is the best grain for a milk producer with a heavy butter fat test I have ever used. It saves hay and keeps the cows in good condition.

"As we do not have to feed pulp here through the summer, I commenced November 1, last year, and the cows produced six pounds more fat a day in six days' time. Thirty-two cows milked as high as 96 gallons of milk, or 29.8 pounds butter fat a day. Twenty head were old milkers. I feed the pulp wet."

Hundreds of other dairymen will also tell you of the wonderful value of Larrowe's Dried Beet Pulp as a milk producer and conditioner. It improves every ration; balances perfectly with alfalfa.

RICH IN NUTRIMENT — CLEAN — SUCCULENT

Larrowe's Dried Beet Pulp is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage with as great or greater succulence—swelling to fully six times its original bulk when moistened. It will not only increase the quantity and quality of milk, but keep the herd in better health with less bag trouble and greater contentment. Try it now. Go to your feed dealer today and buy one sack. Test it on one cow whose milk record you know and watch results.

LARROWE'S MOLASSES-DRIED Beet Pulp is preferred by many feeders on account of its sweetness. Just the plain beet pulp with beet molasses dried. Fine for fattening, also for horses.

Our booklet—"PROFITABLE FEEDING" gives valuable information and feeding instructions. Should be in the hands of every dairyman. Write for a copy—free.

THE LARROWE MILLING COMPANY
607-608 Central Building Los Angeles, Cal.

Your Credit is Good

AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case, it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment you can make that will pay you better returns than an IDEAL GREEN FEED SILO.

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO, A LITTLE investigation will be sure to convince you that you ought to purchase one right away.

YOU CAN BUY AN IDEAL GREEN FEED SILO ON TIME.
Write for our special terms and silo folder A.

When writing advertisers, mention The Cultivator.

State schools in advocating the wider use of shredded stover are playing safe, because they are not advocating a policy which is going to cost those who practice it extra money. Many tests have proved that husking by hand in the field as compared with cutting the corn with a binder and husking it with a machine, allowing for machine depreciation and all that, costs practically the same. The shredding is thrown in and the corn fodder is practically velvet. From 250 to 1000 bushels of corn can be husked in a 10-hour day, depending on the equipment. And whether one owns the machine himself or hires a custom outfit, the annual cost of husking by hand and binding and husking by machine is so near identical that there is no choice.

The main difference between the two methods is that one gives you rheumatism and the other gives you fodder.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Bad Blood

Please give remedy for cow that breaks out with hard lumps on neck and body and also on udder. She bites the front legs back of the knees and rubs and scratches herself a great deal. Otherwise she is in the best of health. Where she can lick the sores it forms hard scabs which come off when washed.—Subscriber, Graham Station.

Skin diseases are usually due to local causes, but this seems to be in the blood. Have your druggist prepare the following: Powdered gentian, four ounces; powdered nux vomica, two ounces; sulphate of iron, two ounces and farina, four ounces. Mix and make into 16 powders. Give one every night. Also get one pint of Fowler's solution of arsenic and give one ounce every morning.

Cough from Dusty Hay

I have a cow that has been milking with her first calf for nearly a year. A month or more ago she begun to cough and stands with her tongue out after coughing. She has fallen off a little in flesh, but has a good appetite and chews her cud all right. Bowels and kidneys are regular. What ails her and what is the remedy?—Subscriber, El Centro.

The whole trouble may be due to dusty hay. It might cause indigestion, which is often accompanied by a cough. Also the dust that she breathes would aggravate it. Feed her nothing but the green alfalfa and some bran for a few days. Also give her enough salt to loosen the bowels a little. Then give dry hay again, but be sure it is not dusty. Oat hay would be good for a change. Sprinkle the hay with water that has a little salt and baking soda dissolved in it.

Swallowed Barbed Wire

In the Cultivator of Aug. 13, on page 163, a question was answered under the heading, "Sick Cow," and suggestion was made that the animal might have swallowed a piece of barbed wire. Here is another letter regarding the same case. The owner had enclosed $1 and received a reply by return mail. It came too late, but this is what he says: "Your prompt reply to my letter concerning sick cow received and appreciated. The cow died the day before in great agony. Chewed barbed wire, threw her head against posts and the sides of buildings; was perfectly crazy. Cut her open and found lungs highly inflamed and full of corruption. Even the flesh inside of the ribs covered an inch deep with spongy matter. After receiving your letter, performed a second postmortem and discovered what you suggested, a piece of crooked wire about three inches long puncturing stomach, diaphragm and lungs. You surely know your business. Thanking you again for your promptness and courtesy.—Subscriber, Rio Bravo."

Paralysis

Would you kindly tell me what to do for a brood sow with little pigs that seems to be paralyzed in her hind quarters and cannot get up? She is constipated and I have given her castor oil, but it does no good.—Subscriber, Santa Rosa.

To loosen the bowels change the food, and if this does not do then cook the food for a while. For medical treatment get the following: Salicylate of soda, two drams, and tincture of juniper, one pint. Mix and give a tablespoon once a day.

Garget

Is there any cure for a cow that has front teats dry, presumably from garget? Can anything be done for garget when it first appears to prevent teats going dry? What are the first symptoms? — Subscriber, Rio Bravo.

Garget may be caused by a bruise, but it is often due to a microbe that enters through the end of the teat, and in that case is contagious. The first symptoms usually noticed are a little cheesy substance in the milk, which may be accompanied by a swelling of one or more of the quarters. There is usually a fever present also, but this is often so slight that it is not noticed. When the symptoms first appear the cow should be given a physic of one pound of epsom salts, half a pound of common salt and a tablespoon of ginger dissolved in about two quarts of hot water and when cool given at one dose as a drench. Wash the udder with warm water containing a little carbolic acid. One who has many cows should also learn to prepare a solution of iodide of potash to inject into the udder. This will destroy the microbes if any are present. The solution should be prepared with boiling water and kept antiseptically clean and when cool enough injected, but if anything gets into it, it would do more harm than good.

CARE OF YOUNG CHICKS

By H. L. Kempster

Studies at the Missouri Agricultural Experiment Station warrant the following recommendations in regard to the care and feeding of young chicks:

During the first two days of the chick's life it should rest and be kept warm. It is better without having food until it is forty-eight hours old. Then the following mixture should be fed in dry litter and also in a shallow tray: Three parts finely cracked wheat, three parts finely cracked corn, one part steel cut oats. Keep some of this in the litter all the time.

Chicks should have access to a clean drinking fountain which should be so constructed that they cannot get themselves wet. It is also desirable to give them access to sour skim milk or buttermilk. Twice daily the chicks should receive rolled oats or the following mixture: Three parts bread crumbs, three parts corn bread, one part boiled egg. This mixture may be fed dry or it may be moistened with sour milk. A very small amount of charcoal and finely cut green food should also be fed.

Keep the following mixture in a box where chicks may run to it at all times: 30 parts wheat bran, 30 parts cornmeal, 30 parts wheat middlings, 10 parts beef scrap, sifted fine, and one part bone meal.

Keep fine charcoal and grit where chicks may have free access to it. Feed four times daily. Continue the green feed and give the chicks milk. It may be advisable to feed a wet mash once a day at 4 p. m. Feed only what the chicks will eat up clean before going to roost. Change gradually from chick food to cracked corn and wheat. Chickens that are not yarded should be fed corn and wheat in litter as a scratch food and should also have access to a dry mash in a hopper where they can help themselves.

Raise chickens with the simplest rations possible. Clean food, consisting of cracked and ground grain; animal food, such as sour milk, buttermilk, commercial meat scrap and bone meal; clean water, plenty of shade, comfortable and dry quarters, freedom from lice and access to clean, fresh earth are essentials for successful brooding.

AGE OF HENS AND PIGEONS

There has been a great development of late years in the Canadian poultry industry. This development has been brought about by many factors, chief among which are the untiring and highly successful efforts of breeders; the experimental work carried on at the various poultry plants of the dominion and provincial experimental farms and agricultural colleges, the information given out by these institutions, the poultry exhibits, in which the people of Canada are now taking a great interest, and, last but not least, the profits of the industry, little thought of in the past, but now well recognized and appreciated.

Record books have been established for horses, cattle, and many other animals, where information pertaining to pedigree, age, etc., are kept for reference, but it has remained to Victor Fortier, Assistant Dominion Poultry Husbandman, Central Experimental Farm, Ottawa, after much personal observation and study, to publish a method whereby the age of hens can be accurately estimated. This information, which is meant especially for the breeder and the judge, has been published under the direction of the Hon. Martin Burrell, in a profusely illustrated bulletin, which is No. 16, Second Series of the Central Experimental Farm. Copies will be mailed to those who apply for them to the Publications Branch, Department of Agriculture, Ottawa.

COOPERATIVE EGG CIRCLES

"The Organization of Cooperative Egg Circles" is the title of pamphlet No. 4, by W. A. Brown, B. S. A., of the poultry division of the live stock branch, Dominion department of agriculture. In introducing this subject the writer defines a cooperative egg circle, states the need for organization and the work that can be accomplished.

Copies of the pamphlet may be obtained upon application to the Publications Branch, Department of Agriculture, Ottawa, Canada.

"Speak the truth, do your work, and see the glory of it all," a man who knew life said to a college class.

That last phrase holds the secret of the highest success. But only to the faithful worker is the glory revealed.

Half the joy of life is in little things taken on the run.—Cherbuliez.

Buy on Installments

Now is the Time to Get Incubators for Fall Hatching

Coulson Co
PETALUMA, CAL.

Do you know poultry diseases?

Can you detect them when they first appear? Do you know what to do to keep them out of your flock?

It is uncontrolled disease that eats up poultry profits; therefore, the man who knows how to fight it is in a good position to become a successful poultryman.

Our POULTRY BOOK tells these things in a clear, concise way. It tells you facts you need to know and every poultry owner should have a copy. Send four cents in stamps today and we will gladly mail you yours. Address your letter to our Consultation Dept.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles

SLIGHTLY ADDLED

A scholar at a local night school inadvertently spelled the word Venice with two "n's." The teacher, a clever man, but not always a correct speaker, sternly inquired:

"Do you not know, young man, that there is only one 'hen' in Venice?"

"Then eggs must be very scarce there, sir," was the ready reply.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Closing Streets

A subdivided 80 acres of land in five-acre tracts. Plat of the subdivision was recorded. A number of streets, 20 feet wide, were set aside to be used as streets. B bought one of these five-acre tracts, then A sold the balance of the tract to C, who decided to close the street and use his 75 acres as a farm. Has B any redress or can he in any way keep the streets open? None of the streets directly pass his property. If C can close the streets in spite of B, what steps will C have to take? And if B can prevent C from closing street, what steps should B take? — Subscriber.

Unless the streets were accepted by the county, and thereby became public streets, or unless B bought with the understanding and as a condition precedent to his purchase, that all of the streets would be kept open, I do not think that B has any right to keep them open. If the streets never became public by not having been accepted by the proper authorities, or by not having been used for five years by the public, C does not have to take any steps to get them vacated, but may close them himself. If B has any rights in the streets, to have them kept open, his remedy is by injunction.

Water Right

A locates on 160 acres at mouth of canyon and files on all water in said canyon—15 inches—and uses same for irrigation. Ten years later B locates in same canyon and uses water for domestic purposes, but diverts no water from stream. Twenty years later C buys B's land, also right of way across A's land. Now C claims riparian right to domestic water which he uses on land purchased from A and other adjacent land, but uses none on land purchased from B. Has C any right to more water than B used and has he a right to divert it from land purchased from B? Please define prior right, also riparian right.

If the land purchased from A is not adjacent to the stream, C has no riparian right for that land. A riparian right belongs only to land which adjoins the stream. If A appropriated a certain quantity of water and has used it long enough to create title, no later comer has a right to take away any part of that which was properly appropriated by A, unless A permits him to do so for five years, which would cause the later comer to have a legal title to the water taken. If C is taking such a quantity of water as to diminish that which legally belongs to A, A should enjoin him at once before C's right ripens into a title.

Ditch Rights

If A is using water by consent of ditch man, can B, C or D tap ditch and thus diminish A's water? Can B, C or D obstruct ditch by allowing weeds to grow in their parts of the ditch so A is unable to get a flow? Must A patrol ditch from A to D to find and close gopher holes while A is using the water? Can either A, B, C or D bridge lateral in such manner and with such material as will materially diminish the flow? Can B, C or D cut off A's water when A is using it by consent of ditch man? What are the penalties?—Subscriber.

If the water company agreed to furnish you a certain quantity of water for a certain length of time, at a price, I think the water company would be liable to you in damages for a failure to furnish the water as agreed, and that your suit would be against them. I am obliged to assume the facts, as you do not state them, and therefore I cannot give you a definite answer, but, assuming that B, C and D have no rights in the ditch, except a right to receive water from it, it is not their province to keep the ditch clear, but it is the business of the company that owns the ditch, or if the ditch is on private ground, it is the business of the one who owns the ditch to keep it free of weeds. If he does not do so, and it is necessary, in order to get your quantity of water, to have it cleared, it would seem to me that the person from whom you are purchasing the water, if you are purchasing it, should stand the expense of cleaning the ditch. The same would apply to keeping the ditch free from gopher holes in order that you might receive your proper quantity of water. That would also apply to the bridge. If you have no contract with any water company or other owner of the water to whom you can look for liability in case of a breach of contract, I do not know to whom you would look for redress and could not tell you without receiving full details concerning the matter. It is possible that you have a lawsuit against B, C or D. You should go to some local attorney before whom you can lay the facts in detail.

ZENO

The Most Efficient and
Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

For Sale by
Producers' Supply Co., Los Angeles; Rialto Protective Association, Rialto; Kessler Brothers, El Cajon; Harry Highfield, La Mesa.
Or by the Manufacturers,
Standard Chemical Company
231 Franklin St., Oakland, Cal.
For information and demonstration in Southern California, address T. O. McClure, Hotel Hayward, Los Angeles.

Household Department

THE MODERN FARM

K. M. Bickel

"This farm aint what it used to be," sez Unkel Ezrie Fry,
"Somehow this modern way of things has sorter took my eye.
My oldest boy, a tractor's got, and writes stuff by the ream.
How one man does the work of five since he got that durned machine.

"Then Susan, she's my oldest girl, runs the dairy and its ilk.
She made the winter's milking pay with a silo I had built.
An' Jim, my youngest, is a dude, and allus was a fool,
But he sends me mighty good ideas from the new state 'aggie school?

"Then maw, she bought a gas engine, to help her if it could,
It runs the farm electric lights, and even saws the wood.
And little Bessie with her chicks, is mighty sure to win
The first prize at the county fair with her patent wooden hin.

"How many were the days I toiled beneath the beatin' sun,
And worried thru the winter, till these new inventions come,
But now I sit and read and smoke, it seems just like a dream,
I might have had this long ago, if I'd lived by gasoline."

—Nebraska Farm Magazine.

A WOMAN'S INTUITION

"There's nothing left but to kill Aunt Anna." The words were uttered in a low tone, but the voice was clear and carried well.

Miss Bartlett started; the train sped on; lights twinkled in the gathering darkness. Miss Bartlett saw nothing,—she scarcely breathed, waiting for what was to come.

There was a silence and then a woman's voice remonstrated. "But John, we can't—if the children ever learn—" The rest was lost in the roar of the train.

"They'll not miss her right away," the man went on, "and anyway their Thanksgiving can't be spoiled."

Miss Bartlett's blood almost froze in her veins as she pictured the trusting old aunt. She tried to think, had her ears deceived her? Could she possibly have misunderstood?

"When—when did you think of doing it?" the woman's voice broke in nervously.

"Right after supper, the sooner the better."

"How will you—"

"The hatchet, of course," the man interrupted impatiently. "You keep the children busy and I'll attend to it out behind the barn; everything'll be over in a few minutes."

Miss Bartlett grew faint and dizzy and the next words made her determine instantly to follow the couple no matter what danger was involved.

"It nearly kills me, John, to think of it; she's been such a good mother."

"I know and the children love her dearly, but what can we do? The money didn't come."

Just then the train slowed up.

"Crum Lynn, Crum Lynn!" sang out the brakeman.

The couple behind were rising, Miss Bartlett reached for her umbrella. She looked up as they passed. The woman was young, not more than 30, pale and worried looking; the man was shabbily dressed and a hard look about the mouth made Miss Bartlett all the firmer in her determination to frustrate his evil purpose.

In a moment, she found herself standing on the platform of a little country station. They were the only passengers who had alighted. The couple stood waiting for the train to pass, and then quickly crossed the railroad.

Miss Bartlett let them get well ahead until in the gloom she could barely discern their outlines, and hastened after.

A path led them to a macadamized road and trolley tracks indicated to Miss Bartlett that it was the Chester Pike. A five-minute walk and the two turned into a cross road. Miss Bartlett followed pantingly and in a little while stood before a low frame house. She saw a flash of light as the door opened and caught a glimpse of a tall bent figure, Aunt Anna no doubt, with three laughing, rollicking children about her. She heard the young woman say, "Have they been good children?" and then the door closed leaving her out in the chill November night.

The house stood on a corner, quite alone and surrounded by a picket fence. Miss Bartlett reconnoitered and some distance in the back, saw the barn behind which the monster had planned to carry out his frightful deed.

She shivered, the horror of the situation grew upon her. What could she do,—could she, a frail old woman battle with this beast? Perhaps her life would pay the penalty of her interference. There was no police. To break in upon the neighbors with such an incredible tale would bring forth only derision.

The ground was soft and moist, her shoes were wet through and her skirts draggled. Miles away in Chester, her sister and brother-in-law were probably enjoying their evening meal, and discussing her habitual carelessness in catching trains. Up and down she trudged in the darkness, her umbrella grasped firmly in her hand. A half hour might have passed when the sound of an opening door made her follow the road around to the side of the house.

A man came out the back door followed by a woman's figure carrying a lantern. From the halting manner of her walk, Miss Bartlett judged her to be Aunt Anna, whom she had seen at the open door with the children. They went through the yard and stopped before a small outhouse.

Miss Bartlett, her heart beating wildly, followed a little in the rear on the opposite side of the picket fence. The man went in, the woman holding the lantern high so as to light the interior. He soon came out and attended by the old woman went on to the barn.

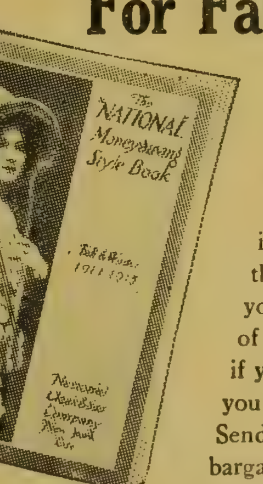
The time had come, Miss Bartlett thrust her umbrella against the palings and frantically tried to climb the fence. The pickets were sharp and pointed and close together. Again and again she essayed, only to slip back, her gloves torn and her arms scratched and bleeding from the splinters.

"O God," she moaned in her distress, "help me before it is too late!"

Summoning at length all her

Free—the New "NATIONAL"

Money-Saving Style Book For Fall and Winter



The "NATIONAL" Money-Saving Style Book
Fall & Winter 1914-1915

The Future Man or Woman

The food taken by the nursing mother influences the physical development of the child. Children should be fed on nothing but the most strengthening foods.

Ghirardelli's Ground Chocolate is both a food and a drink.

Children need no coaxing to take it. They like it and thrive on it. It is the final expression of purity, wholesomeness and deliciousness.

The cost is less than a cent a cup. Begin using it tomorrow.

In hermetically sealed tins.

Quality, strength and price remain the same.

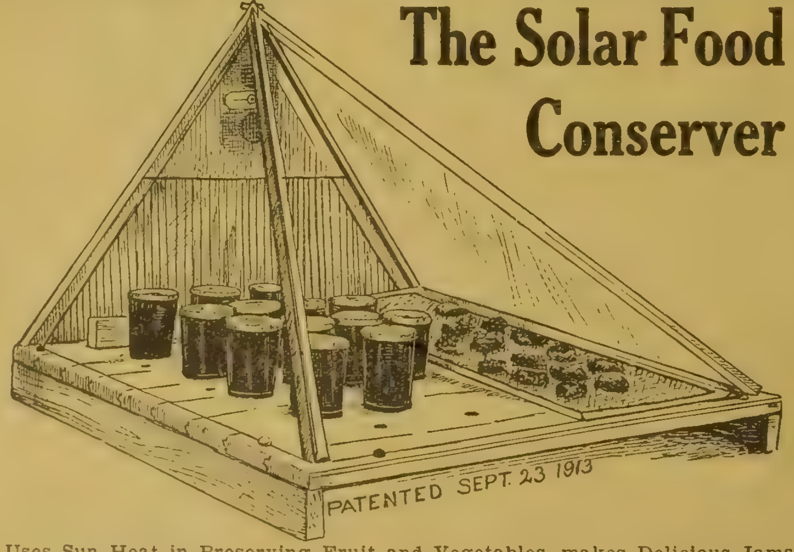
Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

D. GHIRARDELLI CO.

Since 1852 San Francisco

GHIRARDELLI'S GROUND CHOCOLATE

The Solar Food Conserver

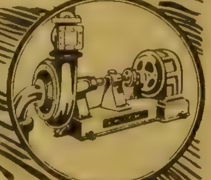


Uses Sun Heat in Preserving Fruit and Vegetables, makes Delicious Jams, Jellies, Fruit Confection, etc. The product sells at fancy prices. Quick and constant returns on Small Investment. Write for descriptive circular.

E. E. Dow & Co., Redlands, Cal.

Krogh Pumps

Reliable — efficient — economical — built for the best wells. 35 years as leaders. Booklet 78B about Horizontals and Verticals — and 82B about motor-driven pumps—are free.



Krogh Mfg. Co.
San Francisco - Los Angeles.

strength, she drew herself to the top and clung desperately with her hands and knees. In a final attempt, she threw her weight toward the inside and dropped over and down upon the oozy sod. Clambering to her feet, she felt for her umbrella, her only weapon, and splashed with mud, hair disheveled and face drawn in an agony of apprehension, ran in the direction the man and woman had taken.

As she turned the corner of the barn, she saw the man standing hatchet in one hand and gazing at the other in which hung blood-dripping, a headless hen.

The old woman held the lantern nearer.

"I'm afraid Aunt Anna is a very tough old bird, mother," remarked the man regretfully.

A sob burst from Miss Bartlett,—the pair looked up, astonishment manifested in their faces.

"Where—where can I get the trolley to Chester?" she faltered.—Farm, Stock & Home.

IDEAS FOR THE COOK

Written for the California Cultivator

By Isabel Cottle.

Breakfast

Baked Apples Cream
Breaded Calf's Liver, Bacon
Hashed Browned Potatoes
Hot Rolls Coffee

Lunch or Supper

Corn Chowder
Rice au Gratin
Buttered String Beans
Lettuce Hearts, French Dressing
Raisin Bread Baked Quinces
Tea or Milk

Dinner

Roast Loin of Veal
French Fried Potatoes
Boiled Cauliflower, Butter Sauce
Sweet Pickled Apples Nut Bread
Lemon Sherbet Little Pound Cakes
Coffee

Corn Chowder

Cut 10 cents' worth of salt pork into cubes and fry out in a saucepan. In this fat fry two medium-sized sliced onions until yellow, then add two raw potatoes sliced and cut in dice and the corn from one-half dozen ears, a pint of boiling water, salt and pepper to taste. Let simmer until the potatoes are tender, then add a pint of scalded milk which has been thickened by the addition of one tablespoon of butter rubbed into two tablespoons flour. Simmer for five minutes and serve.

Rice Au Gratin

Wash three-fourths cup of rice through several waters, drop into rapidly boiling salted water and cover. Continue boiling for 15 or 20 minutes, then remove cover and allow the water to gradually cook out, leaving rice dry and fluffy. Place in a baking pan, mix in lightly one cup grated cheese, one-half cup rich milk or cream and dot with butter. Bake until nicely browned.

Little Pound Cakes

One-third cup butter, one-half cup sugar, two egg yolks, one-half tablespoon milk, three-fourths cup flour, one-half teaspoon baking powder (level), one-fourth teaspoon mace, whites of two eggs beaten stiff. Cream butter, add sugar and beaten yolks of eggs in order, then the milk. Stir in gradually the flour, baking powder and mace, sifted together. Fold in beaten whites of eggs. Bake in small patty pans. Make frosting of the white of one egg, slightly beaten, and sufficient powdered sugar to spread nicely. Flavor. Spread on cakes and dust lightly with powdered chocolate.

Sweet Pickled Apples.

Select firm, well-flavored apples (Pearmains are good) cut through stem leaving skin on. Stick three cloves in each half of apple. Make a rich syrup allowing three pounds of sugar and a pint of vinegar to six pounds of apples. Put the apples in the syrup and simmer until they can be pierced with a straw. A few sticks of cinnamon may be added to the syrup if desired. Delicious served with meat.

The General says:-

The roof goes on last—but think of it first. It's the final protection for buildings. This label stands for 15 years of guaranteed service *at least*—when you buy

Certain-teed ROOFING

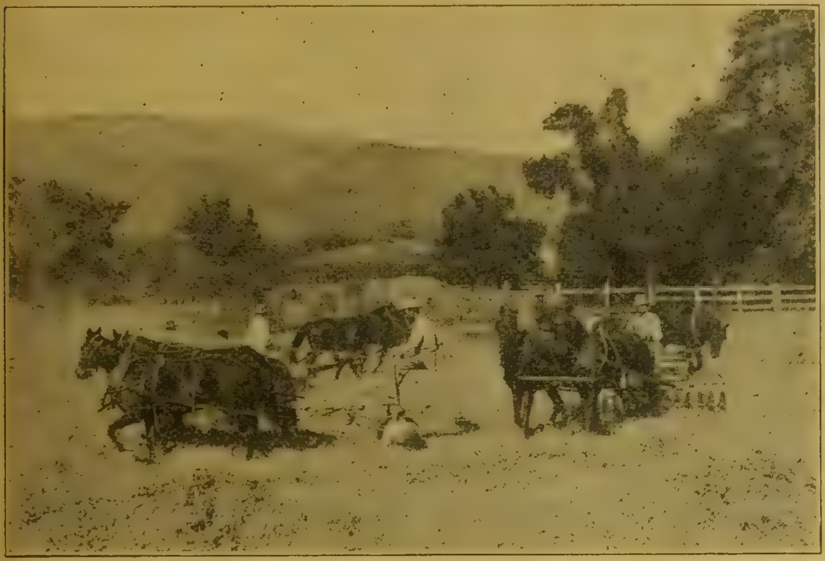
Prize Photos for September

We certainly have had a difficult task in choosing the prize winners from the great number of photographs which were sent. There were 42 in all, and every one was good. Many, however, did not have all the requirements for making good engravings, so could not be chosen, but more than a score, besides these which are printed, have been laid aside and will be used in some later Cultivator, and with the engraving will go the name of the photographer and of the locality in which the photo was taken. The list of those who have submitted photographs is as follows: U. Marks, Pasadena, beautiful little studies in dogs, one of especial excellence, showing dogs perched on back of donkey; F. A. Baumgartel, Anaheim; Mrs. Jesse F. Williams, Coalinga, sends photos of "Baby Ruth and Two Little Kids"; M. Haines, Carpinteria, dog and kittens; Elma Owens, Madera, hundreds of young chickens taken at the university farm; H. J. Alstrom, a field of oats with history,. which we surely will give later; Mrs. R. J. Fuller, Fairmead, a round-up and a lot of excellent scenes; Homer J. Coffman, Laton, family cow and others, every one clear and sharp; Mr. W. J. Arundel, "Two to Milk One Cow"; Englewood Orchard, Campbell, string of eight horses, "We Don't Want an Eight-Hour Law," and they show it by their willing expression; Mrs. Sarah Holyland, Santa Ana, waterfowl; Mrs. D. M. McPherson, Los Angeles, "The Coming Farmer"; Mr. J. B. Morrow, Upland, "Helping Daddy Fix the Cultivator."

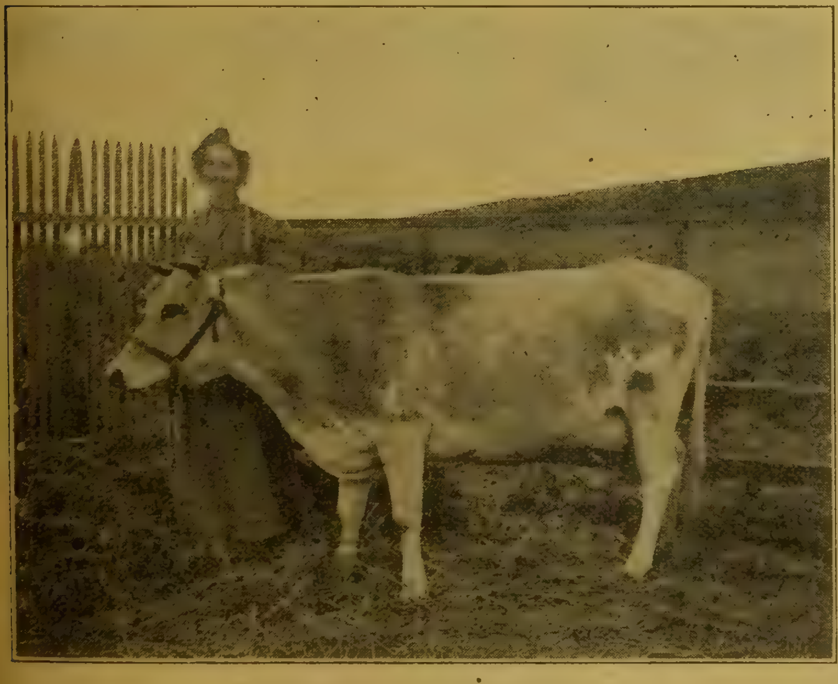
The best part of making photos of home life and animal life about the farm is that their value increases as the years go by. The expense is not great compared with the pleasure they give. If any of our subscribers have problems regarding which they wish help we will be glad to submit them to thoroughly qualified photographers who will give suggestions.



Old Time Way of Threshing Beans

First Prize Photo by Geo. G. McLean, Carpinteria.

Making pleasing photographs of animals is often very difficult, but far better results may be secured by those with whom the animals are familiar than by the strange photographer, no matter how much better technical results he may secure. One of the best examples of this is in a whole stepladder full of cats—photos taken by Mr. McLean—which is in this collection, and which we will use in a later Cultivator.



The Family Cow as a Regular Pet

Second Prize Photo by F. E. Kelly, Burnett.

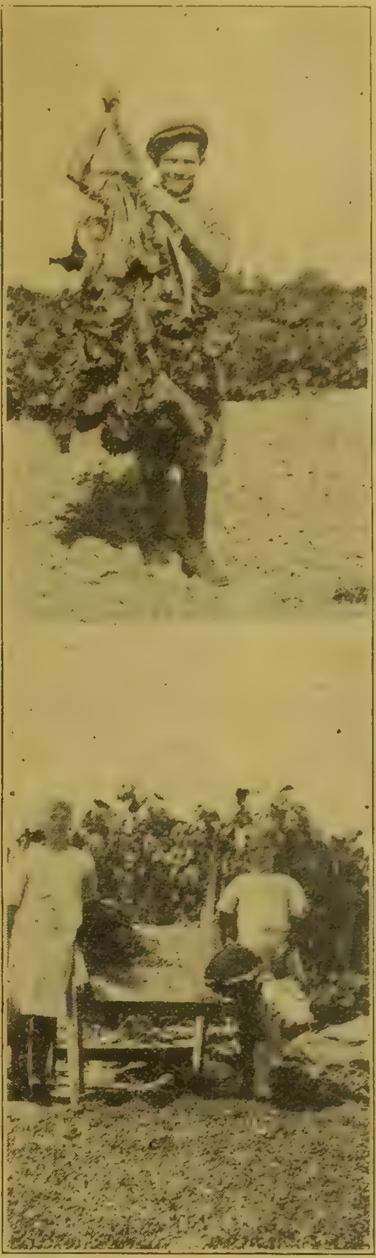
For next month we will want contesting photos in our hands by the morning of Sept. 24. That leaves lots of time for good work. But don't delay too long the sending.

The prizes will be the same—$2.00 and $1.00 for first and second—and in addition the next five will receive one year's subscription to the Cultivator. All photos submitted to be the property of the Cultivator.

A meal well chatted is half digested.

DOLLARS FOR YOUR THOUGHTS PAID IN CASH.

Did you ever start out for a happy ride, stowed away in the tonneau with the baby's go-cart whacking your shins, the lunch basket resting on your left foot and a heterogeneous mass of wraps and cushions pinning you in? If you have you will appreciate the suggestions received from a friend's friend who has a catchall in her car.



Not Prize Winners, But Excellent Photographs

The photo at top by Miss D. Lucas, Visalia, shows that Tulare County produces some sugar beets. The lower photo by Mrs. C. C. Heidt of Gilroy shows one branch of farming which is not very general in California. But sunflower seed are now regularly quoted on the market, and we doubt not there is some profit in growing this crop.

An Auto Comfort.

It is one of those simple inventions

Use HOME MADE ACETYLENE to *light* your House and Barns to *cook* your Meals

100 LBS. UNION CARBIDE

IN GRAY DRUMS WITH BLUE BANDS

You can pick out an acetylene lighted farm as far as you can see it. The light streaming from the windows will be white and indescribably beautiful—the big round lights in the barns will be wonderfully brilliant. Go in and look them over at close range. You will, in most cases, find all the "fixtures" equipped to light up with the pull of a slender chain—without matches—just like electric lights.

The cheerful housewife in every one of these acetylene lighted homes will tell you that her lights have banished forever the gloom of kerosene lamps, and all the labor and drudgery their use entailed. She will tell you also of the delights of cooking on an acetylene range in a cool kitchen—with no bother of kindling, coal, ashes or soot. There are now no less than a quarter of a million families using home-made acetylene for both lighting and cooking. In every case the gas producing stone—UNION CARBIDE—is ordered direct from the nearest of our warehouses, located all over the country. In the drums in which we ship UNION CARBIDE it is as safe to store and handle as common coal. It won't burn and can't explode. The little machines which automatically release the gas from the Carbide are called acetylene generators. The newer models are so wonderfully simple and perfectly reliable—they work with no attention other than filling once a month.

We will be glad to mail our advertising literature which we are sure you will find intensely interesting. Address

Union Carbide Sales Company, *Dept. 7*

42nd St. Building, NEW YORK, or Peoples Gas Bldg. CHICAGO, ILL.

San Francisco--Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, September 2, 1914.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Butter began advancing during the last days of last week and all grades took a half cent further advance on Monday. Arrivals, nearly 60,000 pounds daily. Most stock is local, very little Eastern arriving.

Prices to trade 4 cents above following quotations:

Creamery Extras	.29
Firsts	.26
Country	.22
Ladle	.21

CHEESE

Prices to trade 1 and 2 cents higher:

HAY

Under date of August 29 Scott, Magner & Miller say:

Receipts of hay for the past week, 5397 tons. Most of these large receipts are the medium and poorer grades. The percentage of fancy hay arriving is very small and meets with quite ready sale. Alfalfa from the river districts is arriving in greater quantities, and although a little of this is moving yet there is not enough demand to take care of the arrivals.

Citrus Fruit Market

LOS ANGELES, September 2, 1914.

There are still 3500 cars, perhaps more, of Valencias yet to go forward. A couple of weeks ago growers became concerned because of heavy dropping of fruit and very heavy shipments went forward. This has demoralized the market, and until the large number now on track are disposed of a very weak condition will prevail. The situation is further complicated by immense quantities of peaches and other fruits filling eastern markets. The lemon market is even worse; the enormous speculative prices which were put upon the fruit at the beginning of the war stopped consumption and now Mediterranean countries are shipping in even larger quantities than usual. At the present time there are 100,000 boxes afloat to arrive within a few days. In a sale in New York yesterday over 100 boxes of Mediterranean fruit sold at $1.55. These figures are in material contrast to the speculator's prices, to which they had forced lemons a few days ago, of $10 and $12.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1914, 35,662; lemons, 2,668; total, 38,333. To same date last season, oranges, 12,809; lemons, 2,053; total, 14,862. Total of citrus fruits two years ago this date, 33,497.

NEW YORK, Aug. 31.—Twenty cars Valencias, one car Valencias and grapefruit sold, also one plain oranges and one car lemons sold. Market is slightly better on Valencias. Weather fair and warm.

SUMMER FALLOW

Referring to the cover crop issue of the Cultivator of August 13, an Eldorado County farmer writes:

"I notice in the Cultivator of August 13 the statement that summer fallow is sure death to soils in California. I don't think the party that wrote that has done much farming. I was born and raised on a farm in Eldorado County and have lived on a farm all my life, and I have always found that if I don't summer fallow I don't raise any crop, that is on the grain land; the garden I manure from the barnyard, but if a farmer tries to manure from 100 to 1000 acres it would be quite a job; besides it would take all the manure in the state. To raise a good crop start to summer fallow the first of March. Plow about six inches deep, and the rougher it turns up the better so the sun can get in and burn out the soil. Cross harrow in August or September to level it off; put in the grain before the rains come, and you are sure of a good crop. This humus that Mr. Doty speaks of is the manure or decaying vegetation that is turned under, and without it the soil can't produce, but if the soil is turned over winter after winter with no spring plowing it will get in such condition that it won't raise a healthy weed and will turn to putty, all run together. Manuring the ground is all right, but if a farmer has 500 to 1000 acres to put to grain, it is impossible to manure it all; summer fallowing does just as well."

As to many soils requiring summer fallowing in order to produce grain there can be no question, but this is because these soils have had the humus burned out of them by summer fallowing and they must now be summer fallowed to produce another crop. We think our subscriber's contention only proves the statement formerly made in the Cultivator. As he says, these acres cannot be manured, but ultimately some one must take hold of them and build them up or even summer fallowing will not save them. This, we believe, is true of any country, but more especially arid countries where the summer heat is great. In California's interior valleys summer fallowing destroys soils with fearful rapidity. Rotation and deeper plowing should save this land for a crop every year.

DOLLARS FOR YOUR THOUGHTS

(Continued from Page 237.)

that are the blessing of mankind. It is merely a stout khaki bag the length of the robe rod on the back of the front seat, and its width is the distance from the rail to the floor of the tonneau. A stout rod—a broomstick will do—is run through the upper hem at the back of the bag to hold it in place. This rod of course should be the length of the robe rod. The bag is furnished by a cover flap and attached to the bar by four khaki ties, one at each end of the rod and two in the middle.

Into this capacious bag are packed away the many necessaries for an all-day ride. It's amazing what capacity that bag has, and it is a wonderful comfort to know that every thing is "together" and easily get-at-able.

Suggestions Wanted.

What similar comfort do you make use of in your car or know of that somebody else uses? For the best suggestion the Cultivator will give $2.00 in cash; for the second best, $1.00. These to be printed in our issue of September 17. That is short notice, isn't it? But usually it is easier to do things when we first think of them. All suggestions must be in the office of the California Cultivator, Los Angeles, by September 11. Rush them in.

This prize feature will be continued each month. Watch for offers. Also if you have suggestions for topics, send them in. If there is anything you are particularly interested in or wish to have new ideas upon, let us know, and we will start the idea rolling among the thousands of Cultivator subscribers. And that will bring valuable suggestions, you may be sure.

Keep your head cool and your heart warm. The one who lets his head get hot and his heart cold is in a bad way.—Backbone.

How One Ranchman Pumps Seven Wells with One Motor

This picture shows one application of the portable motor outfit on the Patterson Ranch at Newark, Cal. Mr. Patterson pumped from seven different wells last season—all under varying conditions of head, the motor having worked continuously without a moment's trouble.

This is one more example of the money-saving qualities of the

G-E ELECTRIC MOTOR For RANCH AND FARM

Once installed, the G-E Electric Motor requires the least attention of any power. Its upkeep is almost nothing. There is practically no expense for repairs or replacements. It will run for twenty-four hours a day without attention, and can be started a mile or more away from a switch in the house or barn.

Better, cheaper irrigation is made possible by the G-E Electric Motor, and its field for other uses is unlimited. One G-E Electric motor, mounted on a truck, can be used to run a rock-crusher, pump, concrete mixer, ensilage cutter, or for threshing, baling, grain crushing, etc.

In the house, electric power has proven itself woman's greatest help in churning, sewing, washing, and in many other ways.

How to make Chickens make Profits

it's Free

The Sperry booklet, "Make Hens Happy," has been compiled by men who know the essentials of a perfectly balanced chicken feed. It tells what ingredients a feed must contain to make chickens lay.

You know that chickens, like any stock, to be healthy and strong, must have the right kind of feed, composed of the right food elements. An excess of any one kind of feed means a lack of some other important element the chicken needs for egg production, consequently there is more or less degree of starvation, even though your hens seem to be getting enough to eat.

SURELAY
BALANCED EGG FOOD

is composed of the very elements that the egg is composed of. Every sack of Surelay shows just what its food content is.

"What's on the Sack is in the Sack, and that's What's in the Egg!"

"Make Hens Happy" is full of vital, valuable, profit-bringing facts. Send for it today—just sign your name to the coupon attached and mail it.

Partial List of Contents in Sperry Book, "Make Hens Happy"

- The Business of Poultry Raising.
- How California Chickens Supply More Than Three Times Their Value in Eggs.
- Why the Pacific Coast Does Not Produce More Chickens and Eggs.
- The Most Ideal Climate for Raising Chickens at a Profit.
- A Perfectly Balanced Ration for Chickens.
- How It Is Made.
- A Chemical Analysis of the Average Egg.
- Some Vital Points for Feeding Chickens.
- What Well-Bred Chickens Will Do.
- Exercise for Chickens.
- The Necessity for Dry and Healthy Surroundings.
- How You Can Tell when Hens Are Happy.
- Formulas to Make Lice Powder.
- The Value of Fresh Water and Green Feed.
- Indications of Health or Disease.
- Vital Facts for Feeding Little Chickens.
- Hints On Fattening Poultry for Market.
- Valuable Table Showing the Food Value and All Kinds of Vegetable Feed Products.

OHIO ENSILAGE CUTTERS

The Direct Drive

Does away with all Double Hitch Belts, Gear Drives, Chain Drives, etc.

The "OHIO" has its drive pulley, cutting cylinder, all on the main shaft. Our compact set of gears does the work. Avoids trouble and repair bills.

The "OHIO" cuts EVERYTHING—Alfalfa, Field Peas, Soy Beans, Sorghum, Kaffir Corn, Milo Maize, Corn—It's all the same.

Salem, Ohio, Oct. 23, 1912.

The Silver Mfg. Co., Salem, O.

Dear Sirs: Our 14x32 ft. silo was filled with the "Ohio" No. 17 and will say that in the six years we have filled silo we have never had the same amount of ensilage cut in the same space of time and as satisfactorily done. The 110 tons was cut and elevated in 5 hours. We had five teams hauling from nearby field and could not supply its capacity. It's a dandy. C. D. CARR.

Reverse by Friction

Instantly reverses the machine even under the heaviest feeding without the slightest strain, not even a gear tooth changing mesh.

ONE LEVER CONTROLS ALL

A single lever, almost human, giving operator absolute control of "OHIO" feeding mechanism at all times, stopping, starting or reversing at a touch.

No. 14 at State Orphan Home, Corsicana, State of Texas

The Silver Mfg. Co., Salem, Ohio.

Gentlemen:—It affords me pleasure to say that after three years' trial, your No. 14 "Ohio" Ensilage machine is still doing fine work. We have just finished filling a 100-ton silo with sorghum and found no trouble whatever. We are now operating the machine with a 10 H. P. motor and it gives perfect satisfaction. It certainly does the work. Yours truly,

JINK EVANS, Ind. Mgr.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIII No. 11 LOS ANGELES: THURSDAY, SEPTEMBER 10, 1914 One Dollar Yearly

Future of the Sacramento Valley

The Northern End of California's Great Valley is Perhaps the Least Developed, Yet Rich in Wonderful Possibilities, for its Soil has Remarkable Depth and its Waters are Plentiful. Written for California Cultivator by W. S. Guilford.

Since the first discovery of the Sacramento river and the great valley through which it runs, far-seeing pioneers have looked into the future and have prophesied great development for this rich agricultural region. Its possible production under intense cultivation and the number of people it can furnish food and clothing and furnish labor and comforts for has been frequently estimated by comparison with other rich valleys in older and more densely populated countries of the world.

All of these prophesies are interesting and valuable forerunners of progress. Every empire builder is more or less of a dreamer—and without empire builders of greater or less caliber the Digger Indian would yet control the Sacramento valley.

Compared with 50 or 60 years ago, a large amount of development has been done, but with the possibilities in mind the work has been only well started.

For years the Cultivator has watched and been interested in Sacramento valley development and has been glad whenever a creditable, well founded and sound project has been launched for adding to population and wealth production. Every drop of water delivered by any irrigation scheme adds to the welfare of our state — if the project is wisely planned and carried to a successful completion. And every failure—from any cause—is lamentable both from the standpoint of the misguided promoter and the state, but especially for the settler who would be a wealth producer for himself and for all—if conditions were right.

In the following interview we are glad to give to our readers an estimate of the valley's future and some of the things considered essential in development by one whose opinion we regard second to none, Mr. W. P. Dwyer of the Sacramento Transportation Company. He has been in close touch with commercial and agricultural affairs in the valley all his life and is a close student of conditions. For years transportation by steamers and barges was all that was available for this rich section, and now—even with competition from steam and electric roads—a greater tonnage of a greater diversity of products is handled by boats on the Sacramento river than ever before in the history of the state. In addition to his transportation interests Mr. Dwyer is largely interested in the development of agricultural properties in several counties in the valley.

"Several factors are concerned in the foundation of a successful and enduring agriculture," said Mr. Dwyer. "There must be a rich deep soil; ample moisture for maximum crops must be available; the climate must provide a long growing season; there must be control of natural agencies such as floods that unchecked or uncontrolled would result in disaster; the population must contain a large percentage of intelligent, industrious people who will work and who know how to work to advantage; and there must be ample capital available for the equipment and handling of farming on the same basis as any other successful business.

"All authorities agree as to the richness of Sacramento Valley soils, and if there were no other evidence the production of grain for the past 50 years and the marvelous yields on the same lands under irrigation make certain that intelligent handling is all that is necessary to turn this great natural resource, this store of fertility, into food. And properly conserved with crop rotation, and rational fertilizing Sacramento valley soils should be producing far more 10 or 20 or 40 generations from now than today. It is true that we have a considerable area of heavy clay and silt soils, but these have proven the most enduring in all older countries and with scientific farming we are making them wonderfully productive here.

"There is an abundance of irrigation water in the Sacramento Valley from wells, storage reservoirs and gravity diversion from streams, and compared with the difficulties in constructing works such as dams, diversion and distribution canals in many states, the building of irrigation projects here is a very simple matter. And to try to farm intensively without water in this valley is generally a foolhardy proposition. This is particularly true when with water there is no place in the world where crop production is a more stable enterprise than here.

"In the great Mississippi valley farmers consider conditions favorable if there are 120 days of growing weather between killing frosts. Here we have crops growing during the entire year, and have nine months when most crops make good growth. Citrus fruits do well in many sections. The deciduous fruits, alfalfa and other crops, find no more favorable conditions for growth anywhere than here.

"We have flood control problems, the same as there are in all of the other great alluvial valleys of the world. The winter rains bring down great volumes of water. The valley was made, and is yet in the making, in this way. The surplus water has for ages passed into great basins, giving relief until the water could all pass away into the bay and ocean. Now we are reclaiming these rich tracts with levees, adding large areas of rich land to our producing area, and when the works are complete, with the great by-passes and waterways that present plans contemplate, the flood waters will be satisfactorily handled.

"There is no more important factor in our development than the class of people we secure to augment our growing population. The possibilities warrant the industrious, capable farmer from any part of the world coming here, because with the same effort and capital he can produce more here than where he now is. Let me illustrate with this example—a good dairy farmer in Wisconsin for instance. He may be able to keep 30 cows on 160 acres of land, and have invested $15,000 to $20,000, in addition to his land. He grows some clover and timothy hay, and perhaps some alfalfa and corn for silage. The cows are stabled seven months of the year. On any good irrigated 40 acres in the Sacramento Valley he can grow more feed, keep more cows, and produce more butterfat, and at the same time enjoy the comforts of a far more favorable climate. And it is this type of agricultural manufacturer we want in this valley, the man who has made a success of his business, whether it be fruit or dairy or stock, in some place where conditions are less favorable than here. That kind of settler is a success from the start.

"There is no business in the world so poorly capitalized, none where it is so hard to secure capital at favorable rates for development and production as farming. Yet there is nothing so fundamentally sound, nowhere is that basic security so secure. It is true that formerly, and to a great extent now, farmers are not business men—they keep no books and do too little work with their heads. But business men are farming now, they are manufacturing food,

ZENO

The Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

Citrus and Tropical Fruits

REPORT OF CALIFORNIA FRUIT GROWERS EXCHANGE

By G. Harold Powell.

Financial Statement.

Eleven million, two hundred and sixty-two thousand, one hundred and eighty-five (11,262,185) boxes of citrus fruits have been shipped through the California Fruit Growers Exchange during the year ending August 31, 1914. This includes 10,156,724 boxes of oranges and 1,105,461 boxes of lemons, which makes a total of 28,193 carloads. The exchange shippers have sold 3.8 per cent more boxes of citrus fruit than in any previous year. The exchange members have forwarded 61.9 per cent of the citrus fruit shipped from California, which is the largest percentage of the total crop handled through the organization.

Money Received.

The money returned to California through the exchange amounts to $19,246,757.00. This makes a general average of $1.71 per box f. o. b. for every box shipped. The delivered value of the exchange fruit is $29,434,402.40. In one year only, 1910-11, has the amount of money returned by the exchange to California been exceeded.

Cost To Exchange Shipper.

The operating cost to the shipper who utilizes the facilities furnished by the exchange, including the salaries and entire expense of the 70 selling agencies, the maintenance and expense of the general office in Los Angeles, including the general manager's and assistant general manager's offices, the sales, traffic and legal departments, the cost of the daily telegraphic market-news service, and all other operating departments, the exchange share of the expense of the Citrus Protective League and all other expenses, is approximately 4¼ cents per packed box. This selling cost represents 1 3/5 per cent on the gross sales.

In addition to the operating cost, the exchange has expended 1½ cents per box for advertising its leading brands, or 3/5 of one per cent of the gross value of the fruit. This advertising expense is partly an operating cost and partly an investment for the sale of future crops. This makes a total cost of 5¾ cents per box, or 2 1/5 per cent on the gross sales.

While not a California Fruit Growers Exchange expense, there should be added to the marketing cost 84/100 of one cent per box, which is the average cost which the grower paid to maintain the sub-exchange during 1913-14.

This marketing cost, including the cost of advertising, which has been made possible by the cooperation efforts of the 6500 growers who conduct their operations at cost without personal profit to any one, is the lowest cost of marketing an agricultural crop anywhere in the world. Illustrative of the low cost of the exchange service to its members, it is interesting to note that the salary expense of the Los Angeles office, including the general manager and assistant general manager, traffic officers, attorney, cashier, sales agents and all assistants, including an average of 50 employes, is 3/5 of one cent per box.

Traffic Department.

The exchange shippers have been paid $108,428 for overcharges and breakage and damage to fruit in transit, the cost of which is included in the selling expense of 4¼ cents per box.

The exchange shippers have been paid $343,744.88, the refund of excess charges collected by the Citrus Protective League, with interest, at the termination of the lemon rate case. The league expense is included in the selling cost.

Consumption Increased by Advertising.

During the past few years the exchange has increased the per capita consumption of citrus fruits by advertising. The population of the United States has increased 21 per cent during the past decade; the consumption of California oranges increased 74.6 per cent during the same period. The production of California oranges and lemons is increasing rapidly and the exchange, looking to the future, as well as to the present interest of its members is, by judicious advertising, creating a larger consumption of oranges, lemons and grape fruit. At the same time it has established for the "Sunkist" brand a national standard of quality that is a cash asset to every exchange grower.

Increase In Crop.

From 1900 to 1914 the citrus fruit crop of California increased 254 per cent. The acreage has increased 128.9 per cent in the last decade. The shipments from Florida and California have more than doubled in the same time. The exchange organizations have, therefore, an obligation, not only to sell their fruit wisely from year to year, but to develop a distributing and selling system and an advertising policy at the same time which will cause consumption to keep pace with the increase in production. When production exceeds consumption, then the investment of the grower is jeopardized.

Losses From All Causes.

The business of the exchange has been conducted for the shipper with an estimated loss of $355 from all causes, or 1/542 of one per cent of the $19,246,757 returned to California during the year.

Fruit Growers Supply Company.

The members have purchased $3,319,062.04 of supplies through the Fruit Growers Supply Company, including $2,022,482.64 of packing house supplies, including shook, paper, labels, wraps and sundry supplies; and $1,296,579.40 of orchard supplies, including fertilizers and fungicides, heaters, oil and other sundry orchard supplies. The supply company operates at cost at an operating expense of ¾ of one cent on each dollar of business transacted. The business of the supply company increased 51.7 per cent over the largest previous year.

Review of Conditions in 1913-14.

As a result of the frost in 1913, California lost its commanding position in the leading markets of the country, especially in the East. Florida, profiting by our misfortune, was intrenched in the markets at the beginning of the year. California had to reestablish its citrus fruits in the mar-

kets. In addition the year has been one of abnormal business unrest and depression, and the citrus fruit business, in common with other businesses, has lagged behind the normal rate of expansion.

That the exchange should have shipped the largest crop in its history and should have returned the largest amount of money to the state one year after the disastrous frost, except in the year 1910-11 when general financial conditions were natural, is one of the remarkable achievements in American horticulture.

Three leading factors have made this result possible: first, the international system of uniform distribution through the 70 exclusive agencies established by the exchange members; second, the international campaign of advertising which increased the consumption of California citrus fruits and quickly reestablished them with the consumers; third, the luscious character of the California orange, which makes it preeminently popular with the consumer. Without the systematic distribution, the aggressive salesmanship and the advertising of the exchange, financial ruin would have overtaken many growers as a result of the chaotic condition that would have followed the frost.

Readjustments That Must Follow Increase in Production.

The following readjustments must necessarily take place as the crop increases: First, a large increase in the per capita consumption during the early winter months when the navel crop of the north, the early navels of the south and the bulk of the Florida crop of oranges and grape fruit will naturally be marketed; second, an increasing competition between northern Valencias, late southern navels, and miscellaneous varieties, such as seedlings, Mediterranean sweets and St. Michaels, between May 1 and June 15 when the young Valencia groves of the north come into full bearing; third, a large increase in the consumption of Valencia oranges during the summer and fall months when the young Valencia groves of the south come into bearing; fourth, an increasing competition between the ripe late Valencias of the southern coast districts and the shipments of early oranges and grapefruit from Florida in October and November; fifth, an increasing competition of California lemons with imported lemons and an increase in the total lemon consumption of the country.

These conditions can be met only by recognizing the following fundamental principles:

The average standard of the fruit that leaves the state must be raised, both in grade and in keeping quality. The grade of fruit depends primarily on the grower and secondarily on the grading in the packing house. The keeping quality depends on the care in handling the fruit in the groves and packing houses. The by-product industry must be developed to utilize the lower grades that now are shipped.

Fruit of good eating quality only can be shipped in the future if the industry is to maintain its integrity with the consumer. The shipment of immature or frost injured fruit, or of misbranded varieties, within the state, or in interstate commerce, should be made a state and federal statutory offense.

The distribution of the oranges and lemons of each grower must be uniform throughout the year on a merchandizing basis; neither the grower or shipper can speculate on the market. The fruit must go forward naturally from each grove during the period when it possesses the best quality for that district. Regular distribution increases consumption; it stabilizes the business of the shipper, the jobber, and the retailer. It furnishes the consumer a supply at the lowest average price and gives the producer the highest average return because the product is handled by everyone at a reasonable distributing profit. The distributing cost of citrus fruit after it reaches the jobber, like many other food products, represents approximately 45 per cent of the consumer's cost. Erratic, speculative distribution increases the distributing costs; it results in a lower price to the producer and a higher cost to the consumer.

Effect of Advertising.

Primarily the function of our advertising is to increase the consumption of citrus fruits. To do this it is necessary to have a brand around which we can build our advertising arguments. This brand is the consumers' protection. It is his guaranty as to the quality of the fruit. In other words, we want him to feel that all he needs to know about an orange or lemon is, that it is Sunkist. We must make the consumer realize that the name Sunkist on an orange or lemon means just what the sterling mark means on silver. Our advertising will create in the minds of the consumer a public consciousness of the food value of oranges and lemons. This can only be done by maintaining the highest possible standard of quality, for unless an article has quality, it cannot be successfully advertised. The permanent prosperity of the citrus industry depends on get-

The Use Of Hercules Dynamite On Farm, Orchard and Ranch

MANY people who are unfamiliar with dynamite have the idea that it is both difficult and dangerous to use.

Relatively speaking, this is not at all the case. Of necessity anything which has great inherent power is dangerous under certain circumstances. The fire in your kitchen stove, the gasoline in your car, the electricity or gas that lights your home—all are in a sense dangerous. You have to be careful with them.

You have to be careful with dynamite too. But this necessary care is a very small price to pay for the almost unlimited benefits derived from it when put to agricultural uses.

It will give you better, stronger trees, finer fruit, bigger crops. It will run ditches, fell trees, lift stumps and rocks, excavate cisterns, cellars, wells, etc. more quickly, more efficiently, and at less expense than the same work can be done by any other means. Yes, that care it requires, is care well invested.

We have published an interesting and instructive book, "Progressive Cultivation." It tells all about dynamite—how to handle it, how to store it, how to use it. You will find it both interesting and instructive reading. Write for a copy. No expense involved.

PLACING CAP ON FUSE
CRIMPING
MAKING HOLE IN TOP OF CARTRIDGE
INSERTING FUSE AND CAP
FOLDING CARTRIDGE PAPER AROUND FUSE
TYING CARTRIDGE PAPER AROUND FUSE

How to Prime a Dynamite Cartridge

"Priming" is the inserting of the detonator, whether blasting cap or electric fuse, into the cartridge. When cap and fuse are used, it is first necessary to attach the cap to the fuse.

The fuse should be cut into lengths long enough to reach from the charge when loaded in the hole to at least three or four inches above the surface. One cap is then taken from the cap box by covering all of them, except one, with the box lid or with the hand and allowing the loose one to slip gently into the free hand. Do not try to pick caps out of the box with tweezers, nails, or any hard substances as they are likely to be accidentally exploded. Slip the cap carefully over the end of the fuse, taking care not to push the fuse very hard against the explosive charge loaded in the bottom of the cap and do not twist the cap on the fuse. When the fuse is pushed to the bottom of the cap, make a crimp not more than ¼ inch from the open end of the cap by using a Hercules cap crimper. A glance at the illustration shows you how this is done.

There are two accepted methods of priming dynamite—placing the detonator in the end or in the side of the cartridge. The former is the better way.

When priming in the end, the paper is folded back at one end of the cartridge and a hole made with a wooden punch about the size of a lead pencil or with the straight handle of the crimper into the exposed dynamite. The cap with fuse attached is inserted into this hole and the paper drawn together and tied tightly. The cartridge is then ready for use.

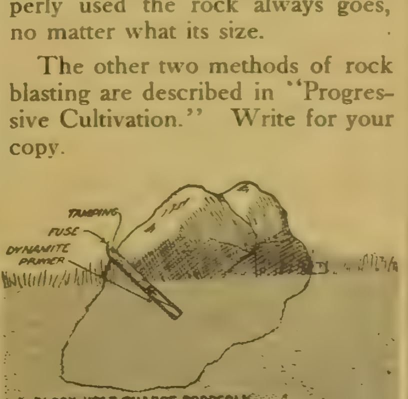
Dynamite Removes Rocks Cheaply and Quickly.

There is but one best way to do anything. The best way to remove rocks or boulders from a field that is to be cultivated is by the use of of Hercules Dynamite. As a matter of fact it is, in many instances, the only way.

There are three accepted methods for rock blasting It may be done by means of a block hole, a snake hole, or by mud-capping. The first is illustrated here. It is a slower method than either of the other two and is only necessary in cases of very large rocks or boulders.

When it is used, the charge is exploded near the center of the rock, as the illustration shows. When Hercules Dynamite is properly used the rock always goes, no matter what its size.

The other two methods of rock blasting are described in "Progressive Cultivation." Write for your copy.



A BLOCK HOLE CHARGE PROPERLY PLACED TO BREAK A BOULDER

"STEEL KING"

MOTOR PLOW

Saves time—money—worry—means better crops. Reasons are obvious when you consider what this excellent farm machine will do for you. The "Steel King" is really an all around farm machine.

Work of 8 Horses!

It will actually do the work of eight horses — do it quicker — and with much less expense.

Only 1 Man Required!

One man can operate the "Steel King" with perfect ease. All operations controlled from driver's seat.

8c per Acre!

Impossible, you say? But a demonstration will prove this statement. Will run at full speed on 4 cents per hour.

$1050 Los Angeles!

You get also an economical first price as well as the lowest upkeep cost. Will do harrowing, discing, plowing, seeding, sawing, pumping, almost anything you want done.

Motor Car Flexibility!

Drives just as easily as a motor car — turns quickly — gets way back into the corners. Light weight — yet extremely sturdy and powerful.
Write today for complete information. It will pay you to learn about the "Steel King"—the up-to-date—the money saving farm and ranch machine.

Deciduous Fruit Culture

CALIFORNIA WALNUT GROWERS ASSOCIATION SECOND CIRCULAR

Uniform Weights.

In line with our policy of cooperating in every way possible with the trade, we have now decided as a result of many requests from our customers, to hereafter pack all bulk walnuts in even net weight 100 pound packages. This will greatly simplify billing, etc., and is bound to prove a great convenience. All bags will have the words, "Net weight 100 pounds, when packed," plainly printed under the Diamond brand.

Crop Conditions.

Weather conditions have been favorable. An unexpected premature dropping of slightly "blighted" nuts has recently occurred which will lower our former crop estimate about five per cent. Our prediction now is for about 10,000 tons for California. It is well that this dropping has occurred early, as these diseased nuts will therefore be out of the way when harvesting commences and the nuts which are harvested should all be of excellent quality. Shipments still promise to be fully ten days earlier than usual. First droppings show up at least 90 per cent light meats, and barring the remote possibility of a freakish very hot spell within the next two weeks, the percentage of dark meats this season will be infinitesimal.

Effect of European War.

France has placed an embargo on shipments of all foodstuffs. This includes walnuts, of which she is by far the largest exporter. If the war continues throughout the fall, as indications now point, it will be difficult to secure imported walnuts from any European source in time for holiday requirements. The best Manchurian walnuts are produced in the Shantung province, China. Kiao-Chow is the port of shipment. This port is now being beseiged by the Japanese whose operations are expected to continue for several months. Germans control many of the railroads in Shantung province. It therefore is not expected that shipments in quantity will be moved from Shantung province until the blockade of Kiao-Chow is lifted. California must therefore be relied upon to furnish practically the entire holiday supply. The California production of walnuts supplies only about 40 per cent of the average consumption of the United States. A serious scarcity of walnuts can therefore be anticipated. Since the outbreak of hostilities in Europe we have been swamped with requests to accept orders "firm at opening prices, whatever they may be" by jobbers who have been counting on foreign walnuts to fill their requirements and by some of our regular trade who had ordered short. In order to protect our friends who placed S. A. P. orders with us early, we have had to universally pass all new business. Our regular customers can therefore be assured of their usual supply of good California walnuts and we believe they will make a good profit on their purchases.

Time for Naming Opening Prices.

Opening prices will not be named by us until we are about ready to make shipments. We believe the trade will approve this policy as it will give buyers an opportunity to know of the exact foreign trade situation at about the time their goods are ready to move—thus eliminating, to a great extent, the speculative feature. No definite date for naming our opening prices has been determined but the date will undoubtedly be fixed between September 20 and October 1.

New Pack Small Bags.

We have recently received a great many orders for Diamond brand walnuts packed in four-pound bags at one cent a pound premium over bulk goods. This small package is going to be a winner with the consumer. The supply is limited. Our broker can give you full information regarding the advisability of switching a portion of your present order to this pack. Better see him at once.

Future Information.

Before we name our prices we will place fully before you all information we can gather regarding both foreign and domestic conditions as affecting the walnut industry. We have salaried agents in Europe who will keep us informed as to conditions there.

PEAR BLIGHT

The Washington state experiment station calls attention of horticulturists of that state to the grave danger menacing the fruit industry in the shape of numerous and sundry alleged cures for blight (pear blight, "fire blight"). These cures take the shape sometimes of tree paints, sometimes of materials for injecting into the tree and sometimes of materials to be placed in the soil about the trees. It is the experience of scientific men, both in the experiment stations and the United States department of agriculture, that none of these so-called cures will do the work claimed for them. In other words, they are probably all pure fakes and their use can only result in loss to the orchardist.

The blight disease and its characteristics are well-known to plant pathologists and horticulturists the country over. Its cause is well-known and the methods of combating it are well-known. There is therefore, little excuse for making mistakes in regard to combating this disease. The only way to cure a tree of blight, once it is affected, is to cut out the infected portions. There is no patent cure. From the very nature of the disease it is very improbable that there will be, and anyone who takes advantage of people in a time of distress, such as a blight epidemic, to work off patent cures or panaceas for the blight is, to say the least, a most undesirable citizen. It is unfortunate that our laws are not drastic enough to prevent the activities of the blight nostrum fakers.

It seems especially necessary at the present time to call attention to this matter on account of the fact that there are being exploited on the market certain "tree paints" as blight cures. One thing seems absolutely certain in regard to these "tree paints," namely, that if they will kill the blight bacteria in the tree they will also kill the tree, or that portion of it upon which the paint is placed.

Ranchers
Dairymen
Fruit Growers
and Investors

ARE you looking for the BEST—absolutely THE BEST—conditions to be found in all California? Nothing like it anywhere in all the State. Read and reflect—then write us for further information and details.

WATER—Abundant and good GRAVITY irrigating and domestic water, ALL you want—WHEN you want it—AS you want it—ANY hour of day in the year at lowest possible cost (only the up-keep of ditches), averaging about 38c per acre per year. One-half miner's inch (about six acre feet) with every acre, from your own canal, with perpetual water right for every acre you buy.

SOIL—The richest, loamy, easily worked soil, containing abundant lime and phosphates, producing enormous crops of alfalfa, grains, fruits and vegetables. (We just cut 28 acres of alfalfa, yielding 132 tons, over 4½ tons per acre, at one cutting.) Level lands, but with enough grade to irrigate easily, that can be cleared and prepared for crops at low cost.

STOCK-RAISING—The fine quality of the alfalfa and grasses grown here, favorable climate, pure water, with mountain range for summer feed, guarantee to the stock raiser that perfection only obtained under most favorable conditions, and warrant the high prices that are obtained for Owens Valley grown cattle, hogs, horses and other stock. Hundreds of head of cattle are fattened here for market annually.

DAIRYING—Dairying in any country has long been recognized as a money-making occupation. Owens Valley, being exceptionally favored in the matter of bright, dry climate, pure water and fine feed, offers opportunities to the dairyman which few communities can boast. Before many years Owens Valley will be one of the banner dairying valleys of this State.

GOOD NEIGHBORS — Good Schools and Churches and Solid Banking Facilities and Positively the VERY BEST bona-fide Land Proposition in the State. Reasonable prices and terms.

BEST of bank and business references on request. We will demonstrate every statement to your satisfaction. You cannot afford to overlook this limited offer (only 55 forty-acre tracts in all), which is the new subdivision of one of the banner ranches of this State. Just placed on the market by responsible owners. Write, phone or call for further information and illustrated printed matter.

Eucalyptus Seeds

In large or small quantities, 40 species to select from. **Write for free pamphlet, "Eucalyptus Culture."** It tells you how to sow the seed, raise the plants and plant out in the field. **Also describes all the leading kinds,** gives their uses, etc.

Trial packets 15c each, 4 for 50c. Write for prices in quantity.

THEODORE PAYNE
345 So. Main St. Los Angeles

In other words, surgery would do the same work as such a paint, minus the cost of the paint, and probably do it more effectively.—Ira D. Cardiff.

APPLE-JUDGING SCORE

The three foremost authorities on apple culture in America have been named as judges at the California Apple Show to be held in San Francisco next October.

George E. Rowe will come all the way from Grand Rapids, the shipping point of the famous Michigan apple belt, to judge the 200 varieties of California grown apples which are to be shown. Rowe is a prominent member of the Pomological society and has served as a judge at the last four Watsonville shows. From Medford, Oregon, the center of the fruit-producing Rogue River Valley, will come J. D. Olwell, a prominent apple grower, and the third judge will be Prof. C. I. Lewis, chief of the Oregon Agricultural College and experiment station at Corvallis, Oregon.

Under the Watsonville system of judging green fruit the total perfect score is 1000 points, made up of 600 points for perfect fruit, 100 for uniform size, 100 for color and 200 for perfect pack. In judging the pack, 40 points will be allowed for bulge, 40 for alignment, 40 for height at ends, 40 for compactness and 40 for attractiveness and style.

For each wormy apple 40 points will be deducted; for other imperfections, for scab or scale, eight points each will be taken off. Deductions on pack, uniformity and color will be made in the discretion of the judges, but no distinction will be made between three, three and one-half and four tier packs. In the competition for sweeepstakes prizes, no variety will be given any preference, and in judging carload lots, 10 boxes from each entry will be examined; 50-box lots, four boxes; 25-box lots, three boxes; 10-box lots, two; and five-box lots, one. In the event of tie scores between two or more entries additional boxes for each entry tied will be examined until the tie is broken.

CONTROL OF PLANT LICE THAT INJURE WALNUTS

The kinds of plant lice that injure the walnut may be artifically controlled with sprays. These plant lice, which are small lemon-yellow insects about 1-16 of an inch long, infest the leaves and nuts, voiding a sweet gummy substance on which grows a black fungus. These insects are largely kept in check by certain natural foes, but these foes do not appear in time as a rule to prevent the lice from injuring the nuts. The United States department of agriculture has therefore been investigating remedies to control the insects before they become injurious.

Spraying Solution Recommended for Summer.

If it is necessary to spray in spring or summer a combination of two per cent distillate-oil emulsion and strong commercial tobacco extract (1 to 1500) is recommended. It must be applied under a pump pressure of at least 150 pounds and the spray directed on the nuts and underside of the leaves. The spraying should be thorough.

Winter spraying is better because far less material is required when the trees are bare than when the foliage is thick. A thorough application may be accomplished more satisfactorily in the winter when high trees can be reached with ease. The winter spraying is directed against the eggs, where the summer spraying is against the insect itself. As walnuts are of commercial value in California the use of the sprays as recommended should help the grower to increase his income. A special professional paper (Bulletin No. 100) has just been issued by the department describing in detail experiments on "Walnut Aphides in California."

UNFERMENTED GRAPE JUICE

The question continually comes to us as to the feasibility of manufacturing unfermented grape juice. We referred recently to the oft-expressed opinion that California juice has not the flavor demanded by the trade and questioned the advisability of its manufacture unless entered into in a large way that will warrant a persistent advertising campaign to force it on the market. But regarding the flavor and the demands of the trade we wrote to Mrs. Louise C. Smith of Pomona, who manufactured grape juice for a period of 10 years and finally gave up the venture. From Mrs. Smith's letter we quote:

"I am sorry not to be able to give very great encouragement to one desiring to make a pure unadulterated grape juice for the market. My own experience certainly does not warrant it. I persisted for 10 years, but I found it increasingly difficult to compete in price with the many cheaper goods constantly being put upon the market. I do not believe it is possible to make a palatable juice, pure and good, and do it cheaply; it is a costly process if only heat and hermetic sealing are resorted to in its preservation, as I found out to my cost. Of course I assume that is the kind of juice you wish to know about. My last and final crushing was 100 tons (surely a large enough quantity). On this I realized only about 10 cents a case of two dozen bottles above expenses, allowing nothing for my labor, while I did the work of two men, being my own engineer and laboratory expert.

"I think there is no prejudice against California juice as such, but the average consumer is more discriminating as to price than quality, unfortunately."

ESCAPED JUST IN TIME

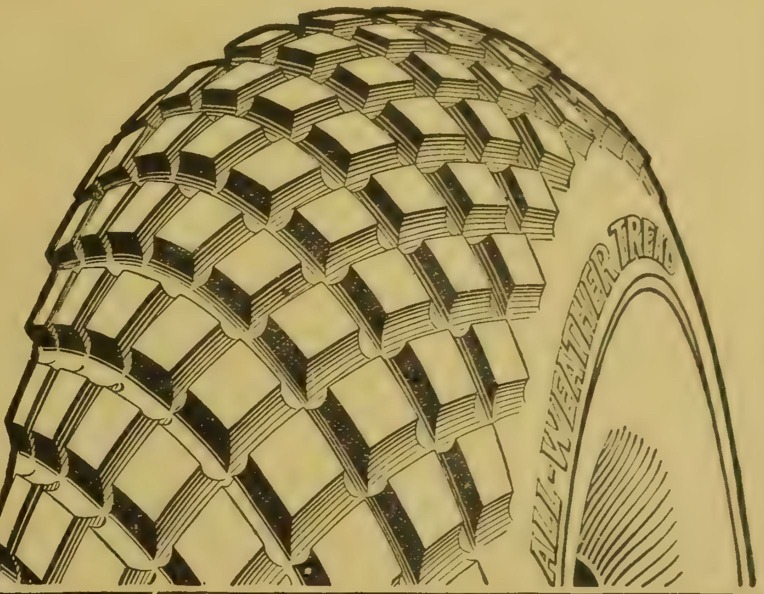
Hans had a small shop in the city, and on leaving it to go home one evening he accidentally turned on a gas jet. Early on the following morning Hans reappeared, and just as he opened the door he struck a match to light his pipe.

Among the things that happened was Hans, and when the force of the explosion died out, he was rolling up against a tree along the curbstone. Instantly several people rushed to his assistance.

"Are you hurt, Hans?" they solicitously cried, lifting him to his feet.

"No, I haindt hurt," answered Hans, "but it looks as if I shoost got oudt in time.—Philadelphia Telegraph.

Your Enemies as a Tire User are
Rim-Cuts
Blow-Outs
Loose Treads
Punctures
Skidding
Note How we Combat them in
No-Rim-Cut Tires



Needless Tire Troubles

Rim-Cuts—the chiefest tire troubles—are utterly needless. They are ended completely—in a faultless way—in Goodyear No-Rim-Cut tires.

Blow-Outs, in large part, are due to wrinkled fabric. Our "On-Air" cure eliminates this cause. This exclusive Goodyear process costs us $1,500 daily.

Loose treads we combat by a patent method. Hundreds of large rubber rivets are formed in each tire, reducing this risk 60 per cent.

Punctures are minimized in our All-Weather tread. It is tough and double-thick.

Skidding is best combated by this same exclusive tread. The grips are sharp, deep, resistless. Yet the tread is flat and regular. It runs as smoothly as a plain tread.

Save These Losses

Save the avoidable troubles. Get all the safety, strength and mileage that you can. Then you have the utmost in a tire.

That is what Goodyear gives you. In the five ways cited, no other maker offers what we give.

The result is that Goodyear leads. No other tire commands such prestige or such sale.

And our matchless output enables prices which few makers meet.

GOODYEAR
AKRON, OHIO
No-Rim-Cut Tires
With All-Weather Treads or Smooth

Tires are not alike. Only one tire made offers these great Goodyear features. Get it. Learn what it means to you.

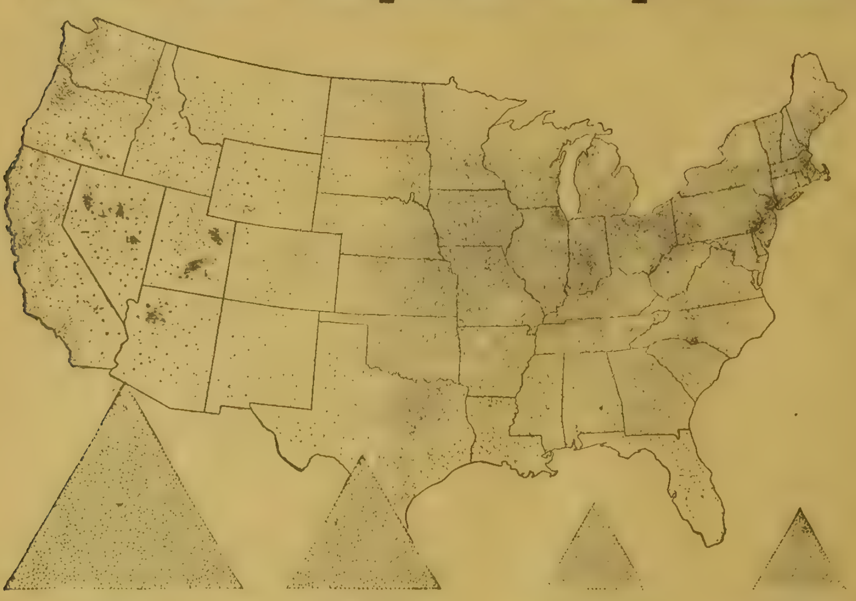
What the Telephone Map Shows



56.8%
Exchanges Bell-connected, but not Bell-owned.
23.5%
Exchanges Bell-owned.
10.5%
Exchanges not Bell-owned or connected.
9.2%
Places served by two companies.

EVERY dot on the map marks a town where there is a telephone exchange, the same sized dot being used for a large city as for a small village. Some of these exchanges are owned by the Associated Bell companies and some by independent companies. Where joined together in one system they meet the needs of each community and, with their suburban lines, reach 70,000 places and over 8,000,000 subscribers.

The pyramids show that only a minority of the exchanges are Bell-owned, and that the greater majority of the exchanges are owned by independent companies and connected with the Bell System.

At comparatively few points are there two telephone companies, and there are comparatively few exchanges, chiefly rural, which do not have outside connections.

The recent agreement between the Attorney General of the United States and the Bell System will facilitate connections between all telephone subscribers regardless of who owns the exchanges.

Over 8,000 different telephone companies have already connected their exchanges to provide universal service for the whole country.

General Agriculture

BUTTERFLY THREATENS ALFALFA

The beautiful alfalfa butterfly with its golden and orange colors that contrast conspicuously with the bright green of the fields brings no enjoyment to the alfalfa grower in the Southwest, for its appearance may mean that in a few weeks the bright green of the alfalfa may be transformed into brown, dead stubble by a caterpillar. Nearly every year this happens to a greater or less degree in the Imperial Valley of California and in the Salt River Valley of Arizona. To aid these alfalfa growers to rid themselves of this pest, the United States department of agriculture has just issued a bulletin (No. 124) entitled "The Alfalfa Caterpillar," which may be had free of charge by those who may profit by it.

The caterpillar that evolves from the eggs of the attractive butterfly is found in all the states save a few on the Atlantic seaboard. Its main sphere of action, however, is in the west. In the Imperial Valley in 1912 the hay crop was lessened by one-third through the feeding of these caterpillars. In 1913, fields in the Salt River Valley of Arizona, had as much as 50 per cent of the alfalfa destroyed. In these southwestern sections alone from $500,000 to $1,000,000, damage annually results from its ravages.

The butterfly is an easy one to single out. The wing is an orange color with a black outer border and a lighter yellow color on the lower side with no border. There is a small black spot in each of the fore wings and a double spot of orange on each hind wing. When the butterfly is at rest the lower surface of the wing is the one noticed. The larvae that hatch from the eggs of the butterfly are dark, tiny, cylindrical objects, which soon take on a green color almost exactly the shade of the alfalfa. The caterpillar within 12 days attains a length of 1½ inches.

The energetic, up-to-date farmer can greatly reduce and at times eliminate totally the damage done by the caterpillars of the alfalfa butterfly. The tiny larva from which the caterpillar develops, if exposed to the hot sun and dust, soon dies, and when careful methods of haying are followed under a hot sun most of the creatures die. The careful farmer, who follows the suggestions given herewith, should save a great part of his alfalfa crop from destruction.

Suggestions for Control.

Keep the ranch in the best possible cultural condition. Irrigate it often and thoroughly and as soon after cutting as the crop of hay can be gotten off the ground.

Renovate every winter and during the month of August, or even oftener if possible, either by disking or by use of an alfalfa renovator, thus disturbing any pupae that may be present and putting the land and alfalfa in condition for good growth of succeeding crops.

Cut the alfalfa close to the ground and clean, especially along the ditch banks, borders, and turning rows, as well as in the main part of the field.

Cut the alfalfa earlier than is the general rule. The proper time is when it is just coming in bloom or is one-tenth in bloom. Watch for caterpillars in the early spring crop, and if many nearly grown ones are observed cut the hay a few days before it is in bloom and thus save the next and future crops.

A minimum amount of damage occurs in fields that are systematically pastured all or part of the time.

A field should never be abandoned because the caterpillars threaten the destruction of a crop of alfalfa before the hay can possibly mature. Mow it at once, cutting it low and clean, thus saving part of the present crop, and in so doing starve, and allow the heat of the sun to kill, a great many of this generation of worms. Follow this by disking and then by either rolling or brush dragging, and a great majority of any remaining larvae will be killed. The ground should then be thoroughly irrigated, and by these efforts the coming crop will be assured.

Turkeys and chickens when allowed the run of a field will keep the numbers of the caterpillars at a minimum.

The protection of toads should be encouraged, as they eat many of these insects, as well as other injurious forms.

It has been noted that a carrying out of only part of these recommendations will not at all save one's crop. The best results come to the one who is thorough in method.

Cooperation among all farmers is necessary to suppress an insect attack completely. An occasional outbreak has been known to occur upon a farm or ranch that is under the best possible condition of crop culture, but in each case it was noted that the careless methods of a neighbor were responsible for the reinfestation.

A FEW WORDS OF CAUTION

A final word of caution regarding economical operation of the machine is given in The Modern Gasoline Automobile, by Page.

In order to obtain the best results from an automobile it is imperative that the owner familiarize himself with all the details of its operation unless he is sufficiently wealthy to hire help to drive and look after the car. All car owners who expect to look after their own machines must first acquire a knowledge of all details of the oiling system and the various points of the chassis that require oiling. More machines wear out because of lack of proper attention to lubrication than because of the amount of work done, as present designs of modern automobile parts are thoroughly reliable and can be depended on to give satisfactory service for many thousand miles without mechanical deterioration. These results can only be obtained if care is taken to keep every moving part clean and properly lubricated.

Careful driving and the judicious control of the car will do much toward maintaining efficiency of the mechanism and it is well to remember that more harm can be done to the various chassis parts by a fast run of a few hundred miles than will result from thousands of miles of slower driving. It is well to drive cautiously at all times and to remember that other users of the highways have rights that must be respected.

When operating a car on rough roads the speed should always be reduced to a low point, and usually the comfort of the passengers will provide the best indication of whether the car is being operated at the proper speed or not.

As soon as any parts are defective and repairs are necessary that cannot be made by the motorist himself the work of restoration should be given to a competent mechanic, even if his charges are higher than those having less experience. At the end of every active riding season and before the inception of the new period of service the car should be thoroughly overhauled and one who is able to appreciate the value of this work of restoration and who takes care of the mechanism always has a machine that is in good running order and that will give satisfactory service. Many motorists are short-sighted because they neglect the mechanism and run the machine as long as it will hold together. As a rule these are the pessimists who hold that automobiles are an unreliable and costly possession.

THE ECONOMY OF THE TRACTOR

The modern farmer and orchardist is placing his farm or orchard upon a business basis. No longer is he satisfied with plodding along in the old way, wearing out horses and men in performing the work that may be done by machinery. Time is an important factor in most of such work, and whatever is accomplished must be done in a certain time, and hence that which contributes to getting the work done more quickly adds to the profits of the business. Motive power has contributed much to the cost of operation. Horses are costly and slow, and they must be fed and cared for whether they are working or not, and the depreciation is heavy. There is now taking place a complete revolution in these things, and machinery is rapidly taking the place of horses, as it is known that they eat up too much of the profits.

Threshing Beans with Tractor

A Minnesota agricultural experiment station report says: "The labor of horses constitutes one of the heavy costs of farming. In order to have motive power available at seed time and harvest, the farmer is compelled to feed and house horses through seasons of practical idleness. On many farms, from one to three unnecessary horses are kept, mainly that they may be available during a few days."

One man can handle from two to four horses and do it right. It is becoming harder to get good men and the wages of such are advancing rapidly. To meet this condition of affairs, and because of the increased value of the land, up-to-date methods must be used; the land must be plowed deep and rapidly, and the cultivator must be kept going to conserve the moisture in the land and to prepare proper seed beds. This cannot be done economically with horses, and hence the ever-increasing demand for a tractor that will be light in weight, economical in operation, reasonable in cost, and which will be calculated to perform the work.

Let Gasoline Do It in the Orchard

Tractors of large power have been in successful operation for a number of years, and these have fully met the requirements of the large grain farmer and have demonstrated the economy of doing this class of work with machinery.

To our mind the members of the Cultivator family are more interested in a tractor that will perform the work of plowing and cultivating in the orchards and vineyards, plowing up and seeding the smaller grain fields, operating the pumping and electric lighting plants, driving the smaller bean and grain threshers, hauling the crop to the station, as well as any other service that can be rendered by six to eight horses.

One of these small tractors was used by one of our California grape growers this spring, plowing and cultivating 250 acres, some of which had a grade of five per cent or more, and the average consumption of California distillate was 11 gallons for ten hours, during which time there was a loss of circulating water by evaporation of but one gallon per day. This was doing the work of six good horses. When the grape vines had covered the ground the tractor was put in the shed and all expense stopped. No more feed to be bought or attention given, as would be the case if horses had been used.

Nearly every week tractors of this character are advertised in our columns, and we would strongly advise our subscribers, if they are interested, to write to the representatives of these machines, asking for catalogues and full information.

We understand that these people are ready to demonstrate their tractor to any prospective buyers.

SACRAMENTO VALLEY FUTURE

(Continued from Page 243)

and such men certainly rank at the very head of all producers in the world. They are growing indispensable necessities from nature's resources, and the consumption of their products is and must continue to increase much faster than the supply. And no security can ever be so good as the land and equipment from which this food is produced. There is a great change in recent years among broad-minded bankers in regard to farm development. They realize that the growth of the state and nation and of all business must start with a successful agriculture, and sound farming businesses are looked on with more favor now than ever before. Our farmers must have sufficient money to equip and handle their farms if the greatest possible returns from the land are to be secured. Many Sacramento Valley banks are doing splendid constructive work by the financial support they are giving worthy developers and settlers.

"Recognizing our vast resources of all kinds, and the fact that there can be no question of our ultimate future, there is one thing we must keep constantly in mind to have our development progress steadily without setbacks and disappointments, and that is: Land prices must be backed by income possibilities, and we must not anticipate the future too far. I firmly believe that the Sacramento Valley will some day have a vastly greater valuation, but increase in value should follow income production, and the money required for development is a factor that must be considered as well as the price of undeveloped land. An agricultural property is worth a price on which it will return a good rate of revenue for a long period of years, and such things as depreciation from any cause, whether orchards, buildings or equipment, must be carefully considered. In fact, the business end of a plant for the manufacture of crops or meat must be figured the same as any other manufacturing proposition.

"We have a great valley with a great future, but we must not let it go at that. There is a work of constructive building to be done and every interest must do its part, settler, land developer, irrigation project builder, carrier of passenger and freight and banker. But it is a work that develops big men in every line of activity, one where achievements will be pleasant to look back upon and one it is a privilege to have a part in.

Guaranteed Five Years

E·W·Paige of Holtville bought 160 acres in Milford Valley—Read his letter!

Milford, Utah, Aug. 20th, 1914.

To Whom It May Concern:

After living twenty years in different parts of California—farming under different irrigation projects all the way from the northern part of San Joaquin valley to the Mexican line, spending eleven years of this time in Orange county—I have bought 160 acres of Milford valley land following a fourteen days' investigation of this project. I was convinced after a thorough test of the productivity of the soil, permanency and cost of water supply, climatic conditions, markets, railroad facilities, social and educational advantages and the opportunity for profit through increasing values, that this was the best possible investment I could make. Purely as an investment opportunity or considered from the home viewpoint, I do not believe any one could make a mistake by buying land in Milford valley. Yours truly,

E. W. PAIGE.

$30 AN ACRE CASH **Under Gravity Irrigation System. Perpetual Water Right — Your Water for All Time to Come — $70 Per Share, 12 Years Time to Pay for It if You Wish.**

Adjoining Milford, Utah, on Main Line of Salt Lake R. R.

The American farmer is entering on an era of prosperity unprecedented. Elbert Hubbard recently said: "I talked to three thousand farmers. The sentiment of the audience was that farmers were to get a bigger and better price for their products than they have in the past. I predict a prosperity the equal of which we have never before known."

Milford Valley offers the greatest farm land opportunity of years—land selling at $30 today that should be worth $250 an acre or more when under cultivation. Where else can you get land on the main line of a transcontinental railroad, that will net $70 or more per acre when in alfalfa—will yield (average crop) 50 bushels of wheat and 90 to 100 bushels of oats per acre, and do this year in and year out—the best potato land in the west (400 to 500 bushels per acre of perfect potatoes that will command a premium in any market)—bumper crops of fruit, apples, pears, peaches, melons, garden truck—**hundred per cent land in every respect at $30 PER ACRE?**

Keen minded ranchers whose bank accounts are **proof** of their past judgment of farm land values are the type of men that are buying in Milford Valley. Go and see this land **yourself**—a Paradise of green valley bordered by rugged mountains, bathed in an invigorating atmosphere of crisp mountain air. This is a land-buying opportunity that will not come again. Write or call today for illustrated booklet. Special home-seekers' excursions at low rates Wednesday and Saturdays from Los Angeles.

Farm Economics

A NORMAL DAY'S WORK FOR VARIOUS FARM OPERATIONS

With the idea of helping the farmer to plan his various farm operations systematically and in advance, the bureau of plant industry, of the United States department of agriculture, through its office of farm management, has for some time been collecting data as to the acreage that constitutes a normal day's work in plowing, harrowing, drilling, seeding, spreading manure, spraying, harvesting, hauling, etc., with different types of land and different kinds of farm implements and machinery. To arrive at averages, the specialists of the department collected information as to the amount of work actually done under varying conditions by many farmers throughout the United States. These figures were then averaged and finally, to make allowance for varying conditions throughout the country and to arrive at what might be called an adjusted performance for all sections, the specialists developed a series of figures which represents neither a maximum nor a minimum, but the amount of work that any farmer might normally expect to accomplish. These figures, which are published in Bulletin No. 3, will prove of practical value to the forehanded farmer who wishes to lay out his work so that his fields will be in condition for each operation at the best date for seeding, cultivating, and developing his crop.

The following are four of the 47 tables published in this bulletin, which give preliminary results of the investigation which still is under way. The following tables deal with operations that are of interest in the fall:

A BUSHEL OF POTATOES

By B. T. Galloway in Rural New Yorker

The quantity of potatoes involved in this story was something over 800 bushels, but for simplicity's sake we have taken a bushel as the unit. The question therefore, that we are setting out to answer is: What happened to this bushel, which represents the average of the 800 bushels involved?

The total cost of producing the bushel of potatoes was, omitting small fractions, 43 cents. The various items that entered into this 43 cents were as follows: Seed, eight cents; fertilizer, 20 cents; plowing, six mills; planting, two and two-fifths cents; cultivating, one and three-fifths cents; spraying, six and two-fifths cents; harvesting and sacking, four cents. The yield was at the rate of 125 bushels to the acre. The potatoes had to be hauled from the farm to the station, a distance of about a mile; shipped by rail a distance of 16 miles, then hauled from the station in the city to the commission man one mile. The cost of freight and drayage at both ends was seven cents, bringing the total cost of the bushel of potatoes to 50 cents.

The potatoes were sold by the commission man, who made returns for each shipment, but as a matter of fact it was definitely known that in some cases where the returns were made the potatoes had not actually been sold. The commission man allowed, as is the practice with commission men in some places, what he considered a fair price for the potatoes. In this particular case it was 60 cents

Table No. 2—A normal day's work with a walking plow, giving the daily acreages reported at six-inch depths for each width, adjustments for these widths, and a scale of allowances for other depths.

(Net Hours in the Field, 9.65)

Produce Cheaper Water

The Pump of the Century

The Layne & Bowler Pump

produces the maximum capacity of water at the very lowest cost. It has been proven under the most severe tests that this pump will work successfully under all conditions. It is an absolute protection against an insufficient water supply.

No Pit Required

All adjusting is done on top of ground. No intricate mechanism. All working parts enclosed. Perfect lubrication system. Unaffected by sand. Built for the particular requirements under which it must work. Absolutely guaranteed.

Everyone interested in irrigation should have our illustrated Catalog No. 80. It tells all about this pump. Write for it today.

Layne & Bowler Corp.

900-910 SANTA FE AVE.
LOS ANGELES, CAL.

after his commission of five cents per bushel had been taken out. Thus, after we had actually paid out 50 cents in the production of the crop, had spent four months in growing it, had taken the risks of drouth, insects, fungus diseases, and so forth, we had a profit of 10 cents per bushel.

As a matter of interest, we followed certain shipments of these potatoes which, while they may not fully represent the average, so nearly is this the case that the results are worthy of note. It was found that certain of the shipments upon which returns had been made at 60 cents a bushel were actually being sold to jobbers for $1.00 per bushel, or $3.00 per barrel. The jobbers in turn sold the potatoes to certain retailers, at an advance of 25 cents per bushel. The retailers, who were men running small stores in the city, were retailing these same potatoes to their customers in small quantities at 10 cents a quarter of a peck, or at the rate of 40 cents a peck or $1.60 per bushel.

Here, then, is a difference in price between the producer and the consumer of one dollar per bushel; or, in other words, the crop after it leaves the grower's hands suddenly takes on a value of 40 cents per bushel to the commission man; 25 cents to the jobber, and 35 cents to the retailer.

Putting it in another way, the grower, after four months' effort, realized a profit on his investment of 20 per cent; the commission man, who acted in the dual capacity of commission man and wholesaler, after holding the product an average of 48 hours, realized a profit of sixty-six and two-thirds per cent; the jobber, on a short turn-over, 25 per cent, and the retailer, on an average holding of probably three days, 28 per cent.

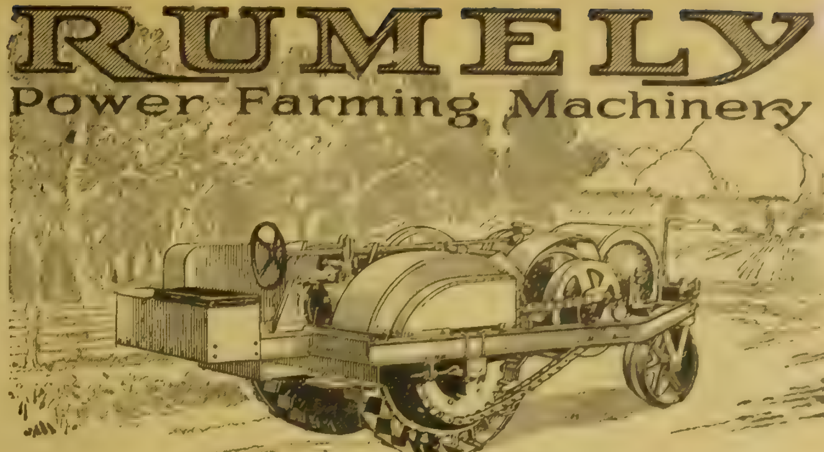
These are statements of fact which in a more or less degree will be found to apply to nearly all of the perishable crops that the farmer produces. We make no comment at this time, being content with pointing out the necessity of organized, intelligent effort to bring the producer and the consumer a little closer together.

Our capacity for doing is the true measure of our knowledge and ability. We hold that the farmer who develops and perfects a fine farm to its highest degree of efficiency is the master of a grand art and the possessor of a rare and profound degree of knowledge. Let him take courage, for slowly the rest of mankind is coming to see this truth. There is a dignity and elevation in the encomium, "He is a fine farmer," that has never been felt and accepted among men as it is today.—H

Soil farming is common sense farming. It is taking off crops and restoring used plant food soil fertility. Taking off crops and returning chemical fertilizers is not soil farming, though at times chemicals must be restored so that the land can be put quickly into shape to grow crops that will enrich it.

Cooperation will suceed only where the neighborhood is alert to the benefits and responsibilities of get-together action and where only matters that the individual cannot as well do alone are taken up.

The cooperative corporation offers no incentive to the speculator.



Coast Built For Coast Use

The ToeHold tractor is built on the coast to meet the requirements of coast farmers. It is especially designed for orchard and vineyard work, but will give a good account of itself at practically any power job.

Rumely ToeHold Tractor

It is low, narrow and light. It will plow close to trees and pass under limbs. All parts are protected from dirt and dust. An air clarifier keeps dirt out of carbureter.

The ToeHold drive-wheels are exclusive features. They do not pack the soil, but give flat backward pressure, enabling the ToeHold to deliver maximum power at the draw-bar.

Ask for ToeHold catalog H32. It gives complete information.

The ToeHold is what you want for your larger power jobs, and the Rumely-Falk and the Rumely-Olds are good stationary engines for your smaller ones. The Rumely-Olds burns gasoline, and the Rumely-Falk stove-tops or kerosene. Every Rumely machine is backed by Rumely service—49 branches and 11,000 dealers. Supplies and parts without delay.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and **BURR CLOVER** are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen — gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

DRAW A MAP

Here's a hint for the youngsters on the farm. Everybody is talking war and reading war, and some not very understandingly. As a suggestion in this direction we have a hint for the boy and girl readers of the Cultivator. Take a piece of tracing paper, or if you haven't that, ordisioner Weldon's latest crop report you will have to work very carefully. Lay it over the best map of Europe you can find. Draw the outline of each country and trace in the rivers and locate the larger cities. Then whenever a hamlet is referred to or a range of mountains, take a pencil and work it into your map. Each one will end the war with a better understanding of European conditions.

AN OPPORTUNITY.

The greatest opportunity to study farm power and improved farm implements will be given at the world's fair at San Francisco next year. There will be a few products of the farm which have never been exhibited before, for the world has been scoured to secure new plants which will do well in other parts of the earth. But these will not be so strange nor so striking as the improvements which have been made in the mechanics of farming. Every farmer on the coast should plan for a day or a few days in the farm power and implement section of the exposition.

GOOD CROPS.

Deputy Horticultural Commissioner Weldon's latest crop report shows nearly all deciduous fruits close to normal. This report is made out from various county horticultural commissioners' estimates and shows conditions of crops in the various counties of the state. Walnuts we note are light. Los Angeles County's estimate is for 85 per cent of a crop; Orange County, 60 per cent; Riverside, 100; San Bernardino, 80; Santa Barbara, 60; Sonoma, 100; Stanislaus, 100; while Ventura reports an 80 per cent crop. Orange, Los Angeles, Ventura and Santa Barbara are the four largest producing counties of the state, and it will be noted that their estimates are all of a short crop. Prunes are still lower as to total output, though Santa Clara, the principal producing county, makes no report, and the other larger producing counties report from 20 to 80 per cent of a crop. As a rule the olive crop is reported close up to 100 per cent of normal.

DIVISION OF THE FUNDS

The special license tax collected from automobiles registered in California aggregated $1,170,986.75. It has cost to administer the law $114,421.00. This leaves a total for division between the various counties and the state road maintenance fund of $1,056,565.75. We believe the half which comes to the counties may be disbursed as each county decides, but the half which remains in the hands of the state is solely for maintenance of the good roads constructed under the $18,000,000 bond act. Los Angeles County pulls down the largest amount, receiving $181,747.90; San Francisco is next, receiving $55,758.88; followed by Alameda, $36,562.39; San Diego, $24,578.19; Fresno, $19,495.25; Santa Clara, $17,386.51; Orange, $15,758.56; Sacramento, $14,658.90; San Bernardino, $13,669.65; San Joaquin, $11,931.06; Tulare, $10,430.78; Kern, $10,080.45.

This division is on the basis of registration from each county.

VETCH SEED

The department of agriculture has issued a circular regarding prices for imported crimson clover and hairy vetch seed. The statement is made that there is more vetch seed in the United States today than there was a year ago and that the boost given to prices is entirely uncalled for, being the result of operations of speculative holders of the seed. Before the European war conditions arose crimson clover seed sold for four and five dollars a bushel. It was almost immediately jumped to $7.50 to $9 per bushel. Since the price was advanced heavy importations have been made, and it is asserted these importations were laid down in this country at the same price as that originally sold at four and five dollars.

Regarding vetch the circular states: "A somewhat similar condition exists with reference to hairy vetch seed. There has been approximately six-sevenths as much seed imported since November 1, 1913, as in the year previous. This shortage, however, is partly counterbalanced by the increasing domestic production of hairy vetch seed."

STATE FAIR

Next week the state fair will occupy the attention of agricultural California. There will be the usual locomotive head-on collision, elaborate fireworks, competitive displays for $25,000 worth of premiums and, of course, harness racing, for which there will be $30,000 paid out in prizes. In spite of the head-on collision in which two or three thousand dollars of junk will be reduced, and a few other similar attractions, it will be a really truly agricultural fair.

While this is the sixty-first California fair, from an agricultural standpoint it has had many ups and downs, especially downs. But for the past few years an effort has been made to redeem it, and last year's report, which Cultivator readers saw, showed that in machinery at least it was a wonder. This year we believe will show an equally great exhibit. We also believe that in live stock the coming fair will show the greatest ever presented to stock people of this state. There will be no fair in 1915; the energies of the entire state will be centered on the exposition, and that and the coming of the exposition is giving an especial impetus to the plans for this year's fair. The dairy contest is attracting considerable attention and the dairy building will be the gathering place for dairymen from all parts of the Pacific coast. The railroads are offering special rates and we look for the largest attendance ever.

AGRICULTURAL ENGINEERS

We have before us a certificate duly engraved and very similar in appearance to the ordinary certificate of title issued by record searchers at every county seat, excepting that in this case the certificate is issued by a firm of agricultural engineers as to physical, chemical and economic survey made of certain described property. The certificate reports investigation of weather conditions taken from reports of the nearest recording station — the particular certificate which we have gives maximum and minimum temperatures during a period of 48 years — also many other points regarding the weather; then comes the soil, its classification, depth, alkali content and other information; water, source of supply, regularity of flow, if from stream, or depth of stream, if from wells; drainage; economical conditions; crops which the engineers would recommend for that particular locality. In general it is a very complete document.

For the practical California farmer perhaps such a document might not be necessary, though we believe it would have material value, but to the Easterner coming to conditions which he does not fully understand and for the capitalist who would develop large tracts, it would be of great benefit and it appears to us that there is a field for this class of work. It will probably save many a dollar and aid in financial success of many projects which will develop California.

Agricultural News Notes

The American Gladiolus Society held its 5th annual meeting at Boston, August 19.

The apple crop of Canada is now estimated at 70 per cent of normal the country over.

The International Livestock Exposition will be held in Chicago, November 28-December 5.

Oklahoma has a state melon growers association which this year marketed the produce of its members at satisfactory prices.

Madagascar shipped lima beans direct to the United States for the first time in 1913. Several direct shipments have been made this year.

The mine production of gold in California in 1913 was $20,406,958, an increase of $693,480 more than in 1912. This year's output was the largest in 31 years.

A delegation from the Argentine Republic is visiting California to study agricultural conditions and take back suggestions for the benefit of Argentine's advancing agricultural industry.

Agricultural fairs among the Indians of the reservations are being strongly urged by the commissioner of Indian affairs. A great many of the reservations are now holding their harvest fairs.

A dollar a pound is the price reported for feterita seed grown in Texas. The new hay is proving very satisfactory in that state, but it is not probable that dollar a pound prices will long prevail.

Both the San Francisco and the San Diego exposition managements assert that their expositions will in no way be halted by the European war. Even foreign exhibits, they declare, will practically all be made as planned.

A fine of $200 and a jail sentence of three months was this month imposed on a New Jersey seedsman, who had sold millet for red clover. It was claimed that he had bought the millet seed for $1.75 a bushel and sold it for red clover at $10 a bushel.

The Florida Citrus Exchange has offered to the Isle of Pines Growers' Exchange the use of its immense sales organization in the marketing of Isle of Pines fruit. This elimination of competition would much lengthen Florida's shipping season.

Every creamery in Kansas now buys cream on a quality basis. Under direction of the state dairy commissioner every creamery in the state agreed to try out the plan for one month. It proved so satisfactory that all have now permanently adopted it.

The Southern Cultivator, anent the cotton selling problem, says: "Cotton is worth 12 cents and any man who sells for less or would buy it for less becomes a robber of the public and general good to that extent. This is putting it a little strong, but it is true. Cotton will keep. It will never be worth less, but when the war is over, will increase in price. So why give it away now?"

The National Dairy Show will be held in Chicago, October 22-31. During the week of the show 15 associations whose interests are allied to the dairy will hold their annual meetings. Among these are the Holstein-Friesian Association of America, American Jersey Cattle Club, American Guernsey Cattle Club, International Milk Dealers' Association and Milk Producers' Association.

Agricultural News Notes of the Pacific Coast

Northern California

Truckee is shipping thousands of sheep and lambs.

The university farm will make an exhibit at the state fair.

The last of Shasta County's pears were shipped September 1.

Newcastle, Placer County, has shipped 1500 cars of fruit.

Another unit of highway work is being started in Solano County.

Sutter County's almond crop will exceed that of any preceding year.

The dairy industry is growing very rapidly at Anderson, Shasta County.

The Happy Valley Land Company has a new 80,000,000 gallon reservoir.

Butte County estimates that the coming orange crop will be the greatest ever.

Hundreds of acres of fine lands in Yuba County will be flooded for rice culture.

Lassen County farmers have organized a $65,000 company for increasing irrigation facilities.

A sale of 100 bales of hops was made last week at Cloverdale, Sonora County, at 20 cents.

Movies have been made of the deciduous fruit growing and packing industry near Oroville.

The creamery at Anderson, Shasta County, has a capacity of 20,000 pounds of butter monthly.

A large tract of rich mesa land near Redding has been purchased and will be subdivided for small orchards.

Glenn County poultrymen are working vigorously for the success of their poultry show at Willows, November 18-21.

The management of the state fair announces that a large exhibit of cavalry horses will be made at the coming fair.

Table grape growers are hoping the European situation will enable the development of cold storage grape business.

The board of supervisors of San Francisco has completed plans and specifications for Hetch Hetchy storage reservoir.

Sacramento Valley farmers paraded in the streets of San Francisco and other bay cities and circulated literature opposing the eight-hour bill.

The Sacramento Valley Irrigation Company will make material improvements in its holdings in Glenn and Colusa Counties in the near future.

The Humboldt County farm bureau is now expecting to have an assistant farm adviser who shall be an expert in lime and its application to lands.

Plans are being made for the formation of the American River Irrigation district involving 18,115 acres in Auburn, Fairoaks, and Orangedale sections.

A mining company at Grass Valley, Nevada County, has relieved shortage of supply of water in some orchards by turning over 130 miners inches to the irrigators.

A filing has been made on a water appropriation of the Feather River below Oroville for sufficient water to cover 37,500 acres on the east side of the river near Palermo.

Central California

Table grape picking is in full swing at Reedley.

Alfalfa prices in the San Joaquin Valley are running from $6.00 to $8.50.

Honey producers of the San Joaquin Valley are holding for higher markets.

A large ranch in San Benito County has been stocked with young pheasants.

The demand for space at the Fresno County fair is much greater than ever before.

Tulare and Kern Counties joined in the construction of a building at the San Diego exposition.

Three apple packing houses were destroyed by fire at Watsonville recently. The loss was in excess of $30,000.

Prune growers near Hollister are making deliveries of cured fruit, the orchards running about half the usual tonnage.

Estimates in Tulare and Fresno Counties show the coming citrus crop to be about 75 per cent of that of last year.

Tulare County reports an exceptionally heavy broom corn crop. It is claimed that this year's prices will reach from $200 to $250 per ton.

Manager Madison of the Raisin Growers' Association is advising not to pick raisin grapes until they have secured their full supply of sugar.

The Visalia Cooperative Poultry Association has succeeded so well in purchasing feed supplies for members that it is now purchasing groceries.

Fig growers are pleased with the general condition of the market and some of the more enthusiastic predict a five and a half or six cent price.

Visalia has an egg plant fruit laid on the table of its chamber of commerce which measures nine inches in diameter and weighs five and a half pounds.

New varieties of Grecian currants or grapes have been tested by the United States department of agriculture on an experimental plat near Fresno.

Children laboring in the cooperative cannery at Porterville are appealing to the board of school directors to defer the date of school opening one or two weeks.

A committee of the Turlock irrigation district has reported in favor of the appointment of a district manager who shall have entire control of the affairs of the irrigation system.

Farmers of central and northern California put in a full day's work at the polls last Tuesday distributing literature on the eight-hour measure which will be voted on in November.

Manager Madison of the grape growers association says that the association intends to maintain the sugar test for grapes. There have been rumors that the test would be discontinued.

Plans are being completed for a state dairy fair to be held at Modesto, Stanislaus County, October 15 to 18. At the same time there will be held meetings of the state dairy association and the California Creamery Operators' Association.

Southern California

Plans for a public market are being made for Riverside.

Grape day was observed on September 9 at Escondido, San Diego County.

Brawley, Imperial County, shipped its first carload of 40,000 pounds of honey, August 31.

The Arboricultural Society of Southern Californa meets at Riverside today and tomorrow.

Redlands is making an exhibit of cereals grown in the mountains back of that city at an altitude of 7300 feet.

The Pomona cannery has closed its season on peaches. It established a record by putting up 2,000,000 cans of peaches.

Calipatria, one of the newer towns of the Imperial Valley, has installed large stock corrals and chutes for cattle shipments.

The San Antonio Fruit Exchange with headquarters at Pomona shipped practically 3000 cars of oranges during the last season.

An orange grower of Covina advertises his belief in the use of lime in the orchard by spraying an entire orchard with whitewash.

Farm Adviser Parker of Ventura County is on the ground ready for duty. His headquarters will be in the new courthouse at Ventura.

Monrovia, Los Angeles County, made Thursday, August 27, anti-weed day, and the entire town took a vacation to observe it properly.

San Bernardino and Riverside are about to enter a legal contest over water rights now used by Riverside and claimed by San Bernardino.

A walnut grower at Whittier, Los Angeles County, recently lost $6,000 in the burning of a large quantity of walnuts stored in packing house.

Late blight developed in some of the walnut orchards of Southern California, and the output will probably not be as heavy as anticipated earlier.

A French manufacturer of perfume is looking over the California field and expects to establish gardens for the growing of flowers for their perfume.

The fifth annual meeting of the La Verne Orange Growers' Association was held last week and the manager reported 847 cars total shipments for the season.

Los Angeles bankers are aiding in the financing of cotton growers of the Imperial Valley who are unable to dispose of their crops because of war conditions.

Ranchers of San Fernando Valley in Los Angeles County are planning the expenditure of two and a half million dollars for distribution of waters over the entire valley.

After a meeting of the lima bean growers' association at Oxnard recently a 35-cent advance was made in the price of limas. Contractors are making every effort to discourage the association.

Horticultural Commissioner Bishop of Orange County reports the black scale about the worst ever. The cool season, together with more or less fogs and moisture, have been favorable to the growth of the scale.

The Coast

Utah farmers are holding wheat at still higher prices.

The live stock sanitary board of Arizona now employs 73 inspectors.

Barley at Castlebrook, Washington, is running 20 to 30 bushels per acre.

Farmers of Okanogan County, Washington, are sowing winter wheat.

A serious epidemic of hog cholera has broken out in certain sections of Utah.

There will be more extended planting of cotton in the Gila Valley of Arizona.

Experts from the agricultural college of Berlin are studying potato diseases of Utah.

Wheat growers near Bozeman, Montana, have sold most of their crop at 75 cents per bushel.

The first load of long staple cotton was delivered at the gin at Chandler, Arizona, on August 28.

Threshing has been finished at Drain, Oregon. Oats are now selling at 85 cents and wheat at 95.

Later reports are in effect that the production of alfalfa seed in the Yuma section will be rather lighter than usual.

Chandler, Arizona, is manufacturing brooms from Chandler grown corn. The factory is managed by the Farmers' Union.

Quarantine of the state of Utah because of infestation of sheep scabies was lifted on August 24 by the department of agriculture.

A creamery and cold storage plant at Nampa, Idaho, together with several hundred pounds of butter, went up in smoke last week.

Steps are being taken to organize the farmers of the Salt River Valley, so as to market products and protect the interests of the farmers.

The sugar factory at Ogden, Utah, announces that it will stand by its contracts in selling sugar at prices that prevailed earlier in the season.

The Inland Empire of Western Washington is trying storage houses built of concrete and of vitrified brick to determine which is preferable.

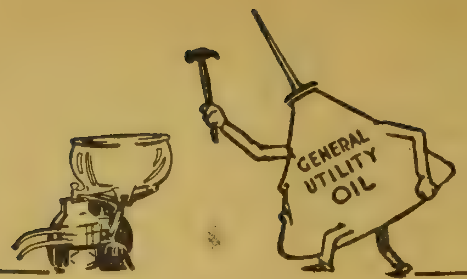
Director Forbes of the Arizona agricultural experiment station advises a more consistent fight against Johnson grass, which is a great pest to the state.

Hop growers of Washington and Oregon are elated at the war prices on hops. Some enthusiastic ones believe that a dollar price will yet be reached.

The state tax commission of Arizona estimates the number of range cattle in that state as 704,379, and that their value is approximately $24 per head.

Extensive feeding experiments are being made on range steers at Union, Oregon. Alfalfa and barley are both being used and alfalfa shows by far the greater increase.

The English sparrow has finally found a friend in the alfalfa grower of Utah, who declares that this universal pest has taken up the active work of exterminating the alfalfa weevil.



The Wrong Oil Ruins Your Separator

To lubricate your separator with ordinary or general utility oil is one of the quickest ways of sending it to the junk pile. You need a special oil for the finely adjusted mechanism of this delicate farm machine.

Standard Hand Separator Oil

is made especially for cream separators—and for that reason it will most satisfactorily lubricate your separator. It keeps the bowl spinning smoothly and enables you to get *all* the cream. It doesn't "gum." Saves repair expense. Lengthens the life of your separator. Ask your dealer for Standard Hand Separator Oil.

Standard Oil Company
(California)

You Can Feed—
your farm stock on
Cottonseed Meal

and keep them in a healthy, sound condition. As a feed for cattle, COTTONSEED MEAL has no equal. It fattens and builds good sound flesh. When fed to chickens, hogs, sheep, horses and mules, the results are remarkable. Cottonseed Meal is the very heart of the cotton—the most nutritious part.

Recent experiments in Southern California and for many years in the South have proven Cottonseed Meal to be an excellent FERTILIZER when mixed with other products. Let us tell you more about COTTONSEED MEAL—an interesting booklet for the asking.

Live Stock and Dairy

SUGGESTIONS FOR THE CONTROL AND PREVENTION OF HOG CHOLERA

From Circular of the United States Live Stock Sanitary Association.

The extreme prevalence of hog cholera last year and the great losses sustained are still vividly impressed upon the minds of farmers and breeders, and considerable thought is undoubtedly being given as to the best way and means of preventing a like occurrence this year.

It must be borne in mind the disease is of germ origin, and is acquired by hogs through contamination of their food supply. This contamination may take place in a variety of ways, principally, however, by birds, dogs and men carrying the disease germs on small particles of dirt or manure gathered up from places where the disease has been or is present.

The majority of hog pens are in a filthy condition, as a result of the accumulation of litter and manure gathered through months and perhaps years. Many times food is scattered in the pens and becomes contaminated by all kinds of filth before being eaten by the hog, hence if cholera has existed the litter and manure has been saturated with the body discharges of sick animals, and is alive with germs.

To control the disease, owners of hogs, must be educated to the importance of sanitary measures, and not be permitted to lapse into indifference because of the possible use of serum as a cure or preventive.

A steady war should be waged on pigeons and crows, which feed in infected pens and carry the disease all over the vicinity. Dogs are frequently carriers of the disease and should not be allowed to run at large, even on owner's premises, if cholera exists in the neighborhood.

Stock buyers, strangers, and neighbors visiting the premises should keep away from hog pens, and the individual owner should not let his curiosity lead him to tramp near or in hog pens belonging to his neighbor.

All outbreaks must be quarantined and only owner or his help allowed to go near the diseased animals. To curtail the losses, the single treatment should be given and the operator and helpers must take the precaution of using rubbers while working, removing and disinfecting them after completion of the vaccination.

Explicit directions should be given by the veterinarian that pens are to be cleaned daily and disinfected with a solution of cresol, U. S. P., six ounces to a gallon of soft water.

Above all, dead hogs are to be buried or burned. Allowing dead hogs to remain unburied, the placing of dead hogs in low places, or dried up water courses should be made a misdemeanor. If no statute covers these matters, then sanitary authorities should adopt regulations which will effectively deal with them.

Wagons used in removing dead hogs, or in drawing away litter and manure from the pens should under no circumstances be taken on to the public highway.

Thorough and complete disinfection of the pens and yards should be practiced daily. using the disinfectant of the strength already described. Where outbreaks occur, stock buyers should be warned against visiting the premises and should be advised of the great danger there is in carrying the infection from farm to farm, and to avoid it by using rubbers, to be removed and disinfected after visiting individual farms, no matter whether cholera exists on the premises or not.

Railroad stock yards are a prolific source of spread, and a regulation should be issued forbidding the removal of hogs from stock yards except for shipment by rail for immediate slaughter. Railroad yards and pens should be cleaned of all litter and manure and then disinfected after each shipment.

Persons delivering stock to these yards should be warned, by posted notices, to avoid going into "yards."

Prevention.

As the disease is without doubt taken up with the food supply, the question arises: How best protect it from infection?

It is suggested small feeding pens be built with closely woven wire fence to which hogs should be admitted only at feeding time. These pens should have a cement floor, which must be kept clean of all litter and manure and then sprinkled with the solution previously mentioned. Troughs should be disinfected and lifted off the floor and exposed to the sun.

Sleeping quarters should be arranged so they can be kept cleaned and disinfected. Good pasture away from water courses and roads is necessary to prevent any infection being carried by stray animals, or from contaminated water.

As a further precaution, not only against hog cholera but against various parasites which swine are often troubled with, a dipping vat can be built with very little expense and a cheap disinfectant used.

The disease is not borne in the air but is acquired by taking into the system the disease germs.

Protect your hogs from coming in contact with sick hogs and protect their food and water supply from contamination.

When the disease has existed, it is wise to provide new quarters entirely for the brood sows. While young pigs from immune mothers carry an immunity for a short time they are liable to infection later if permitted to remain in infected quarters. It is well to plow and seed the old yards.

CUTTING ALFALFA

There is considerable interest in cutting alfalfa hay in the silo cutter so as to secure more compact mowing away and more economical feeding. We have endeavored to get information along this line, and many have claimed that the economy of handling and the more complete consumption by the stock more than compensate for the cost of running through the cutter. We are informed that the Miller and Lux corporation handles much of its alfalfa according to this method. On this point we wrote to Mr. R. L. Adams, formerly connected with the company, but now witth the

University of California. Mr. Adams writes:

"It is entirely practical to mow cut alfalfa hay with the blower. I can not tell you just how much more of the alfalfa you can store in a given space than alfalfa hay, but the quantity is not as great as most people imagine, due to the fact that alfalfa hay will pack down pretty solidly when in the large stack usually built in California. Various estimates by Miller and Lux superintendents ranged from one to one, to one to four, that is, there would be as many times cut hay as alfalfa hay, according to the last figure. My judgment is that the quantity is not more than one and one-half of cut hay to one of alfalfa hay, although the amount might possibly be one to two.

"The feed value of alfalfa is increased since the short stalks will be consumed by the cattle even when rather woody, which will not be the case with straight hay. We found it more economical to handle hay by this method when it was to be used for fattening steers, especially those expected to finish during the winter. Alfalfa so cut was not used for stock cattle.

"The method in handling was to haul the hay directly from the shocks, where it had previously cured for a period of about two weeks, to the cutters, unloading from wagons directly into the cutter and blowing the cut feed to the stack.

"In using this hay to finish steers, the chopped alfalfa was spread in layers, moistened and allowed to thoroughly heat, during which fermentation would take place. Just before being fed to the steers, a certain proportion of ground grain was mixed with the hay, and the whole fed in troughs.

"Since our practice was to stack outdoors the item of saving room was not an important one. The chopping was done to get the greatest feed value from the hay.

"Personally, I believe where facilities are available that it pays to cut all alfalfa hay. This is not always possible for the man with a small acreage, however, because of the extra men needed on the cutter and stack."

HOME-MADE CHEESE

Disastrous butter prices have not been without compensation, for they have driven some dairymen of the Imperial Valley to the manufacture of cheese which is sold on the market so as to bring to the dairymen much better returns than would the butter. Mr. Arthur Fell gives a bit of information as to this venture.

The farmers who are taking up cheese making are mostly Swiss. One dairyman is using the product of 400 cows and for his own people is making a small quantity of Swiss varieties of cheese, but generally the ordinary cheddar type is manufactured and finds ready sale. The dairy referred to is located near Silsbee in the southwestern part of the Imperial Valley. There is another, northeast of Heber, where a Swiss dairyman is manufacturing the milk of 300 cows into cheese.

The local market is caring for much of this cheese, though some has been sent to Los Angeles and met with ready sale. The success of these dairymen and the low prices of butter fat are causing other dairymen of the valley to consider a like venture.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors.
A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.
As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

Protect Your farm, family & stock from drought with a Deep Well
The man with a deep well doesn't have to worry about the weather. He knows that whether it rains or not he will have plenty of good pure water for irrigation—for live stock—and for domestic use. Shallow wells don't pay. Drill a deep well and be drought-proof.
A Pomona Deep Well Pump is the only pump to use if you desire a sure constant water supply at the least cost.
The Pomona Pump is used in connection with dug, bored or drilled wells from 8-inch inside diameter up, and for capacities of 50 to 1000 gallons per minute, built for pumping from a depth of 75 feet to and including 500 feet.
It lifts water from great depths very economically—works without jerk, jar or vibration—and seldom requires repairs. A man wrote us recently that he had run his Pomona Pump steadily for 2712 hours, with no trouble, and not one cent for repairs—and he is only one of many.
Pomona Deep Well Pumps are efficient—reliable
Write for Catalog---or Call and See Us
Our experts will be glad to advise with you without any cost or obligation on your part, if you will call or write us. Our "Pump Catalog No. 54C" will be sent free to any address upon request. When writing state the depth of your well and its location.

Make Your Winter Barn Work Easy
LOUDEN

WM. LOUDEN
Originator of Modern Barn Equipments.

Louden Barn Equipments meet the needs of the business farmer—the man who farms for profit.

Write us for free sketches and suggestions for your new barn. State size and kind of barn needed; number of cows and other stock you wish to care for. The service will cost you nothing, and we may be able to save you money and trouble.

The Louden Litter Carrier saves time in the morning and evening, when time is most precious. With a Louden Carrier you can

CLEAN THE BARN IN HALF THE TIME

The Louden Carrier moves easily suspended from an overhead track, behind the stalls. You can place it at a convenient height for loading, raise it with a light pull, and send the load out to the pit or manure spreader. It never balks. Let us tell you of the many special features.

Louden Carriers are easy to install. No expert needed; their cost is so little they will pay you even if you have but a few cows or horses

We manufacture carriers for all purposes: Feed and Litter Carriers, Milk Can, Harness and Merchandise Carriers. Also Louden Steel Stalls and Stanchions, Spring-Balanced Mangers and Manger Partitions; Cow, Calf, Bull and Pig Pens, Go-Right and Alignment Devices, Hay Tools, Power Hoists, Window Ventilators, etc.

Write for our free book "Some Interesting Facts on a Homely Subject." It gives important facts about fertilizing values of manure.

Illustrated Catalogs FREE. See Your Dealer or Write Us. 116

THE PACIFIC INTERNATIONAL

The Portland Union Stockyards is sending out premium lists and advance information as to the coming Pacific International Live Stock show, which will be held at the Portland Union Stockyards, December 7-12, 1914. Stockmen who are interested should write Secretary N. C. Maris, North Portland, Oregon.

DRAFT HORSE BREEDERS MEET

There will be a meeting of the California Draft Horse Breeders' Association at the Travelers' Hotel, Sacramento, on Thursday evening, September 17, at 8 p. m. Every member of the Draft Horse Breeders' Association as well as everybody interested in the draft horse business is requested to be present.

In buying new cows for the dairy one should buy of dairy farmers who practice rational methods of feeding, preferably from those who do not feed too much grain and rich concentrates. Many cows have been fed so much grain that they have lost their capacity for handling home-grown roughage. Such cows are no longer profitable dairy producers and should be avoided when buying new cows for the dairy.

If you keep cows, you may as well have good ones as the other kind, for a good cow takes no more hay and requires no more attention than a poor yielder. It would seem that all farmers, whether they consider themselves dairymen or not, would wish to improve their herds.

Health among live stock, as well as among human beings, depends largely upon healthful surroundings. No farmstead can be healthful that has scattered around it a lot of decaying rubbish.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Ulcer on Breast

Have a mule, seven years old, that has a large sore on the middle of the breast, a little in front of the legs. It is also swollen some around it. What shall I do with it?—Subscriber, San Fernando.

This is probably caused by the mule leaning against the manger while eating. Remove the manger or make it higher or lower. There may be a core in the center of the bunch. Split it open up and down through the center and be sure to cut it deep. Then dress it once a day with a solution of permanganate of potash, one-half a dram to the pint of water.

Bloat on Alfalfa

Would you suggest through the Cultivator, general treatment to prevent cows bloating on alfalfa pasture? Also emergency treatment in bad cases of bloat. — Subscriber, Rio Bravo.

When cows feed on clover or alfalfa that is wet with dew or hot from the sun in the middle of the day they are liable to have indigestion and bloat. They usually eat too much anyway and if only allowed to be in pasture for two or three hours after the dew is off, and a short time again in the evening, allowing the rest of the time for ruminating, they would get enough to eat and do better and there would be very few cases of bloat. The best remedy for bloat is a pint of raw linseed oil with two ounces of turpentine in it. If necessary repeat the dose in an hour or two. Also tie a large hay rope in the mouth. The cow trying to get the rope back where she can chew it will cause the gases in the stomach to be regurgitated, which relieves her very much. In case of extreme bloating it may be necessary to puncture the side and let the gas escape that way. This is best done with a trocar and canula, but a common knife plunged in and turned a quarter way around has saved the life of many a good cow. What you do, do quickly, for extreme cases do not last long.

Enlarged Quarter

I have a Jersey cow that seems to be in perfect health except that the right front quarter of the udder is quite hard. It is as large as if full of milk, but we only get about a half-pint of milk at each milking. The milk seems to be all right and it does not hurt her to rub or squeeze the quarter. Since she was bred July 6 it is growing larger. We feed her green alfalfa twice a day and plenty of alfalfa hay. She was fresh January 16 and is giving three quarts of milk from the other three teats. We do not use the milk from the swollen quarter.—Subscriber, Lancaster.

The enlargement may be due to a tumor growing in the udder or it may be due to an abscess. If it is due to an abcess it will break inside and the pus come away with the milk. If it is a tumor very little can be done with it. Bathe the quarter with warm water every time you milk and rub it with the hands a great deal. Be careful to milk out all you can. Make an ointment of half a pound of lard, half a pound of vaseline and four ounces of pine tar. Heat them and mix while hot. Rub it on the quarter once a day.

Profit in the Poultry Yard

MARKETING POULTRY PRODUCTS

Written for the California Cultivator

By Jean A. Koethen.

It is one thing to raise chickens and quite another to sell them at a profit; one thing to breed your hens up to laying 180 eggs a year and another thing to get the highest average price for the eggs. Marketing is a matter of initiative and business ability; it is also a matter of conscience and common sense, and these last two qualities are not quite so rare, I hope, as the first two.

I mention conscience here, because I fear there are not a few people raising poultry who would not scruple to sell eggs two weeks old as "strictly fresh" if they thought they could "put it over" the other fellow, and I know there are breeders who wouldn't hesitate a minute to sell a five dollar cock for twenty-five, because I got caught that way myself once. That particular breeder is out of the poultry business now, and the people who sell ancient eggs as "strictly fresh" will be.

Parcels post seems likely to change our methods of marketing considerably, that is, it will if the producer adapts his methods to it. But you can't send "just any old thing" to the particular consumer by parcels post.

POULTRY SHOW DATES

Sacramento, Sept. 12-19, 1914, State Fair Poultry show, J. L. McCarthy, secretary, Sacramento, Cal.

Riverside, Oct. 13-17, 1914, County Fair Poultry show, E. I. Hammond, secretary.

Anderson, Cal., Oct. 22-24, 1914, O. W. Dais, secretary.

Stockton, Cal., Oct. 28-31, 1914, W. H. Mackay, secretary.

Sacramento, Cal., Nov. 2-7, 1914, C. A. Wilkins, secretary, Sacramento, Cal.

Santa Cruz, Cal., Nov. 11-14, 1914 inclusive, E. J. Harran, secretary, Santa Cruz, Cal.

Petaluma, Cal., Nov. 11-16, 1914, Thomas McGuire, secretary.

San Mateo, Cal., Nov. 12-15, 1914, Fred West, show secretary, box 701, Burlingame.

Willows, Cal., Nov. 18-21, 1914, Otto F. Schuchard, secretary.

Oakland, Cal., Nov. 24-29, 1914, Chas. G. Hinds, secretary, 535 42nd street.

Pasadena, Cal., Dec. 1-5, 1914, M. D. Cartwright, secretary, Pasadena, Cal.

Modesto, Cal., Dec. 2-5, 1914, A. D. Roberts, secretary.

San Francisco, Cal., Dec. 8-13, 1914, inclusive, W. H. Ingram, secretary, Fruitvale, Cal.

Porterville, Cal., Dec. 15-17, 1914, A. D. Fawcett, secretary.

Phoenix, Ariz., Dec. 23-26, 1914, Arizona state show.

Newburg, Ore., Jan. 5-9, 1915, C. Duer, secretary.

Coeur d'Alene, Idaho, Jan. 6-9, 1915, O. A. Laaks, secretary.

Los Angeles, Cal., Jan. 6-12, 1915, Henry H. Mumford, secretary, Prospect avenue, South Pasadena, Cal.

Albany, Ore., Jan. 7-10, 1915, E. Schoel, secretary, Albany.

Tacoma, Wash., Dec. 29-Jan. 2, 1915, J. A. Caddey, secretary.

The commission man, for whom no one has a good word, took everything, rots, cracked eggs, little eggs, big eggs and most of the profits, but at least, he took them. The consumer demands that we use our poor eggs at home and sell only what is worth buying. He also refuses to pay any more for it than he would pay his grocer, and this is just where the shoe pinches.

The producer who markets eggs by parcels post must either have several egg customers in the same neighborhood, to whom he can send a good many dozen in the same package, or he must put something else in his package besides eggs, something that will be worth more per pound than eggs, for it is the first pound that costs. The more he can add to his first pound without much additional weight in the packing, the less will be the cost per pound.

Eastern marketing experts are advising the sending of the general produce package, a couple of dozen eggs, a dressed chicken or two, and one or more expensive vegetables, such as asparagus. How this would work in California I do not know, but I am quite sure the eggs and chicken would, and the consumer generally is more particular about his chickens, and more afraid of the shop-offered article, than he is in the case of eggs.

Four things are essential to the man who would sell his poultry products to private customers.

He must have the goods. This sounds dead easy, but it is really the hardest thing of all. In order to market his eggs as "extras" which is what every egg producer wants, he must have large eggs, weighing over 22 ounces to the dozen; they must be all of one color and all the same size. In the San Francisco market only white eggs can be marketed as extras, but there is no distinction in the Los Angeles market, so far as I know, and certainly private customers do not differentiate. Above all things the eggs must be fresh. They must also be clean, for a dirty egg, while it may be alright inside, makes a bad impression.

Market eggs should be infertile. This is not only to satisfy the consumer but to save loss to the producer. Eggs sent to the commission man or big city grocer are candled, and every rotten egg or egg showing chick development is thrown out, which means that the producer has paid freight on them for nothing. It is estimated by the federal government that preventable losses in market eggs amount to nearly 17 per cent of all the eggs produced the country over. Five per cent of all eggs marketed show chick development; five per cent are shrunken from holding, and two and a half per cent are rotten. Doesn't it look as if we ought to "swat the rooster?" In Missouri alone it is claimed the loss from fertile eggs amounts to a million dollars a year.

I am sure that California cannot be as careless in this matter as Missouri, yet, when I used to buy eggs it was almost impossible at certain seasons to get good ones, and I have heard a good many people since make the same complaint. It is all right to use fertile eggs on your own table or to sell them to your next door neighbor if they are perfectly fresh, but when you send them to market or to the fastidious consumer, see to it that they are infertile. An infertile egg, especially one that has been kept in a cool place, will keep almost indefinitely. In fact, they never do rot as fertile eggs do, while a fertile egg, after a few hours in a warm place, is unfit for food.

See that every egg marketed is large and clean and fresh, and every chicken plump and neatly dressed, and you will have fulfilled the first requirement for successful marketing.

The man who has something good to sell must let people know about it. If you want parcels post customers you must reach possible customers by means of a postal card or neat circular, calling attention to the excellence of your product. Sometimes one has friends in the city to whom he can offer his goods. Sometimes names may be gotten from a telephone directory. I think a good many names might be gleaned from the society columns of any big city daily. Such names are usually the names of well-to-do people who should be willing to pay a fair price for a really good article. You will not receive many answers at first, but just one customer means another presently, and if you keep quality in mind, and really do furnish something uniformly better than can be had in the stores, you will succeed ultimately. It takes a long time to work up any sort of a business.

Emerson has said somewhere that if a man has something to offer which is really a little better than others offer, the world will come to him for it, though he lives in the middle of the desert. I don't know whether this applies to poultry products, but it is pleasant to think that it does.

The man who has something to sell must charge a reasonable price for it. Some people are willing to pay five cents a dozen above the regular price for guaranteed eggs, but many are not. Many consumers, I suspect, think that getting in touch with the producer means a little reduction in the cost of living. The producer who is looking for parcels post customers must figure out the cost of his products and the cost of transportation and packing very carefully, and if he can cut the retail market price a little, it will probably be to his advantage to do it, at least till he has worked up a reputation. Sometimes it is a good plan to offer eggs at a given price, say 40 cents, the year round to a steady customer.

(Continued next week)

The Summer Season

Don't expect to cram for eggs in the fall without preparation during the summer.

"As TRUE as the Name" "Superior from Every Standpoint"

"AMERICAN" Surface Irrigation Pipe

Made in lengths of ten feet each, from a single sheet of galvanized steel, with a heavy taper collar riveted to one end, making total length 10 feet 6 inches.

"AMERICAN" pipe is made with the "lock seam" or turned joint—contains no rivets, except at collar. A riveted joint has only 70% of the strength of the sheet metal, while a turned joint has 100% or more. This means that "AMERICAN" pipe will last as long as the sheet steel. It is practically indestructible, and it is impossible to produce leakage in this pipe, as the turned seam is DOUBLE LOCKED and soldered. It is the pipe you will eventually use. Write for Illustrated Catalog.

We also manufacture steel tanks, wagon tanks, watering troughs, dipping tanks—in fact, anything in sheet metal. We make RIVETED pipe for underground use only.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper **and sign full name and address. Unsigned communications receive no attention.**

Raising Turkeys

Would an experienced poultryman consider it sensible to undertake to raise 200 turkeys on a 12-acre farm, one-half being in alfalfa, clipping their wings and using sufficient six-foot netting to enclose an acre and moving to fresh ground when necessary until August, then turning them out on barley stubble? Or would there be greater chances for success to go back in the foothills where there is unlimited range?—Subscriber, Merced.

I think you would have a better chance of success with your turkeys on unlimited range, for it is their nature to pick up their living and they are almost certain to be overfed if they are confined, but if you are already on the 12 acres perhaps it would be better to make the attempt where you are. The thing can be done, but 200 birds is a good many for that amount of land, and you will have to handle them very carefully. Do not confine them at all, except for the first week or two. If they are cared for by domestic hens, confine the hens in wire coops and let the turkeys run. If they have turkey mothers let them go where they like after about 10 days (depending on the weather), but see that they are in before the chill of evening comes on. If you have garden or lawn or anything you want to save, fence that in instead of the turkeys. It is not necessary to clip a turkey's wings in order to keep it inside a six-foot fence. Turkeys are so stupid about fences that they will not try to fly out unless they have something to fly upon first. A four or five foot fence with a barbed wire on top is said to be absolutely turkey-proof.—J. A. K.

Geese

Do geese lay both in the spring and in the fall? Is one allowed by law to pluck geese before and after they lay? Are geese troubled by any insects? Do goslings need lots of water?—Subscriber, Roberts.

Geese lay only in the spring, beginning in February, or sometimes as late as March first. I know of no law, but it is considered cruel to pick geese except at moulting time in the spring and fall, when the feathers are loose. When you see the geese begin to pull their own feathers out, you may know that it is time to pick them. Geese and ducks are seldom, if ever, troubled by vermin. If the goose or the hen which hatches them is kept free from lice the goslings will be free, and they are not likely to be troubled afterward. Goslings that are raised to be marketed at 10 weeks of age as "green geese," need not have water except for drinking. Many geese are kept longer than this without water and get along very comfortably, but geese that are kept for breeding should have water to swim in, or fertility will suffer. Goslings should never be allowed to swim till they are fully feathered.—J. A. K.

Chicken Pox

We have a lot of sick chickens and hens. They have yellow-looking pimples on their heads and some of them sit and gasp and some make a noise when they gasp. Many have died. Can you tell me what it is and what to do for it?—Subscriber, Durham.

Chicken pox is not usually as severe as this, but sometimes in malignant cases the disease extends to the throat, false membranes are formed, as in diphtheretic roup, and the bird dies unless it is promptly relieved. As the disease is contagious all sick fowls should be isolated at once. Give the whole flock, sick and well alike, calcium sulphide once a day for a week. Mix it into a moist mash so that each bird gets about a grain each time. Treat the yellow pimples on the heads by removing the crust with the fingers and touching the sore with a feather dipped in creolin. Dust with iodoform, and for several days after grease with vaseline. or lard. If you examine the throat of one of the birds that seems to be gasping for breath,. you may find a diphtheretic deposit, which is at first thin and yellowish, but afterward brown and thick. To remove this false membrane, dip a swab of absorbent cotton in warm salt water (two drams common salt to a quart of water) and gently rub at the membrane until it is loosened. When the membrane is removed, moisten another swab of cotton in a two per cent solution of lysol or carbolic acid and apply a minute or two to the diseased surface. If many fowls are affected this treatment will hardly be possible, but it may be worth while for a few choice birds.—J. A. K.

Legs Weak

Hens are moulting. Have beautiful red combs and look healthy, but one walks as if she was stiff; another walks right down on her legs instead of her feet. There is no dampness or poison around. Might it be anything contagious?—Subscriber, Hollister.

I wish you had told me the breed of these hens. If they are of one of the heavy breeds, Rocks, Reds, Dottes or Orpingtons, most likely they are overfat, and the pressure of the fat in the abdomen, along with the weight, perhaps, of an unlaid egg, paralyzes the nerves going to the legs. If you find, by feeling the abdomen, that they are too fat, the only thing to do is to cut down the ration and make them work harder. Leave the cornmeal out of the mash and put bran in its place. Give them nothing but green feed in the morning. Don't let them get at the hopper of mash till noon, and give the grain (no corn) at night only, in deep litter. If they can be turned out "to grass," so much the better. If they are not overfat I can only suggest rheumatism, which is not likely at this season, or tuberculosis, but please let me hear from you again if my first guess is incorrect.—J. A. K.

Name of Bird.

I saw in your Questions and Answers department of the issue of August 20 request for the name of a bird. From the description given it is undoubtedly the phainopepla. Although its actions are similar to those of the flycatcher it does not belong to that family, but to the same family as the wax-wings. It lives on a mixed diet of seeds, berries and insects, especially millers.—John Krit, Poway.

Curing Lemons

Will you please inform me in your answers in the Cultivator how to cure lemons that have to be picked green on account of being over size?—Subscriber, San Diego.

When the lemons are needed for immediate shipment the only treatment necessary is to store them so that they do not receive too much air or where the heat is so great as to shrivel them. The best lemons are picked perfectly green. Some growers leave them in ordinary orchard picking boxes, laying paper over them to prevent excess evaporation; others stack and surround with tents, watching closely the sweating process and ventilating as required. When wanted for immediate shipment it has been found desirable to store in tight room and raise the temperature with moist heat, usually by placing buckets of water over oil or gas stoves, maintaining the temperature of the room at between 90 and 95 degrees F. The curing is accomplished by this process in from one to two weeks. We would suggest that the inquirer write the United States Department of Agriculture, Washington, D. C., and ask for G. Harold Powell's "Status of the American Lemon industry," a reprint from the Yearbook of 1907.

Brown Apricot Scale

Please give name of insect on apricot twig which I send.—Subscriber, Lankershim.

This is the brown apricot scale, lecanium corni, which infests prune, apple, apricot and a number of other deciduous trees. It may be controlled by spraying with any strong caustic spray or distillate water mixture. It may be sprayed at any time now, for while it would be more economical to wait until the leaves drop off the scale is not so easily reached as it is before it has reached the hard stage.

Budding Peaches.

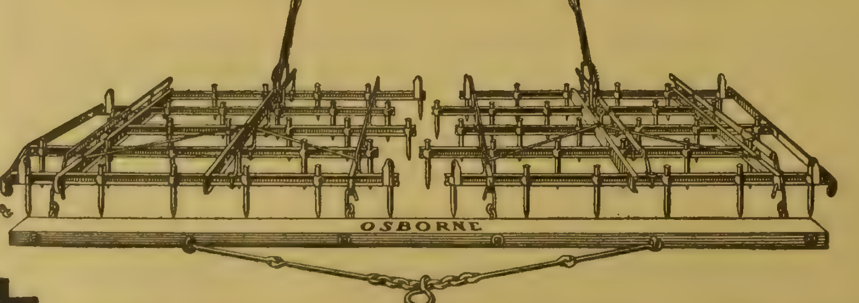
When is the best time to bud peaches? Are they ever fall budded as citrus fruits sometimes are? Please give general instruction.—Subscriber, Compton.

Peach trees are usually budded in September in the case of nursery stock and this is a good time for all sorts of fall budding. The stock must be in a good growing condition, so that the bark will slip easily. Bud material should be selected from terminal branches of the current summer's growth and the leaves cut off, leaving about an eighth of an inch of the stems on the bud. These stubs serve as a handle with which to place the bud in the stock. The bud sticks should be kept cool and moist till used and those carried into the field should be wrapped in a damp sack and but one at a time should be taken out as needed. The bundle of sticks may be carried suspended over the back as a man carries a blanket roll. This makes them handy and easy to get as needed.

The most rapid work is done when the budder crawls along on his knees and buds over the seedlings, making a T-shaped incision in the stock an inch or two from the ground. B

EVERYTHING FOR THE RANCHER.

Genuine Osborne Harrows



We are sole agents in Southern California for genuine Osborne Harrows of all description. Send for completely illustrated catalogue. Beware of imitation Harrows claimed to be Osborne. The genuine Osborne Harrow is always furnished under the Osborne Brand. Sold by all the leading dealers. BEWARE OF IMITATIONS.

QUALITY ARNOTT GUARANTEED
ARNOTT & CO. INC. 112-118 So. LOS ANGELES ST., LOS ANGELES, CALIF.
QUALITY ARNOTT GUARANTEED

making the vertical cut first, then making the cross cut upon one side, then straight across the first incision and down again on the other side, the corners of the bark are raised, which admits the bud by simply pushing it under. The buds are most rapidly cut and placed by putting the thumb over the upper part of the bud and making a drawing-up cut (starting the knife about half an inch below the bud) and ending with the bud between the knife blade and thumb with the lower end projecting. This is slipped in at the top of the incision without changing the position of the bud. The bud is pushed into place by pressing down on the leaf stem of the bud.

I have seen budders put in 3500 and 4000 buds a day by this method, keeping two good tyers busy. The buds are tied with cotton string or raffia. If raffia is used it should be wet and cut out in ten inch or foot lengths, whipped out straight and allowed to dry in the shade. It will then work rapidly and not slip after tying. In about ten days after budding the strings should be cut by passing a sharp knife blade across them on the opposite side from the bud. Budding sprouts on trees in the orchard is done in the same manner.—J. W. M.

Fall Irrigation of Walnuts

A point in dispute among walnut growers is whether it is better to irrigate walnut trees at this season of the year or not. Some say irrigation now will start a new growth just when the tree should be dormant, which growth will die back eventually. Please give us the benefit of your experience as to what time of the year and how often walnut trees should be irrigated.—Subscriber, Fullerton.

The presumption from the above question is that the walnut trees have had sufficient irrigation to keep them in good condition to this time, but that the ground will be very dry before the winter rains begin if no further irrigation is done. Walnut trees are like all other trees and plants in their requirements for moisture and will give the best returns if the soil is kept damp enough to secure good growth throughout the entire growing and fruiting season. It is true that if a tree is dormant from want of water at this time of year it will begin a new growth if given plenty of water and that there is danger of winter killing the tender growth. This may also happen if early rains come and is likely to do more harm than the application of water to such trees at this time. There is no fixed rule as to time of irrigation nor the amount to be applied, as this depends altogether on the soil and the size of the trees. Sandy soil will require water in smaller amounts and oftener than the heavier soils, but if the irrigation is properly done will not require more water in the aggregate. Large trees require more water because of more foliage through which the water transpires. Water should be given often enough and in large enough quantities to keep the soil constantly damp to a depth of four to six feet from the time the tree begins to grow in the spring until the nuts are gathered in the fall. If this is done the new growth hardens and the leaves fall at the proper time. The hulls open and the nuts drop out clean and the trees do not begin to grow if early rains come nor if the land is irrigated in order to start the green manure crop which should be sowed as early as possible in all walnut orchards.—J. B. N.

Melon Aphis.

There is an insect which kills our melon vines and covers the entire patch. I send leaf completely covered with them. What can we use to save vines?—Subscriber, Orange.

There is practically no saving of this year's crop other than to destroy every vine which is seriously infested. Also be sure to burn weeds surrounding the melon field, that is, any that are green enough to harbor the pest. In this way the next generation of aphis will be destroyed and next year's infestation greatly reduced. Any spray which will destroy the pest is also injurious to the vines.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Foreclosure

A year ago I purchased by contract a parcel of land and moved my stock and goods on land. Have kept all agreements up to this time, but cannot now make the payment and interest that is due. If the man I am buying from should bring proceedings against me and foreclose, do I get a year's time in which to live on it and if possible to pay up all that should be against it by this time next year? Or can he force me to vacate the place at once? The contract reads, "In case of failure to pay any part, all money at once becomes due."—Subscriber.

You do not get a year in which to redeem. In the case of the foreclosure of an ordinary contract of purchase and sale (I assume your contract is of the ordinary variety), the court would fix a time such as it considered reasonable, which might be 30 or 90 days, but not likely longer than 90 days, within which you would be permitted to fulfill the contract, and if at the end of that time you did not do so, your rights would be forfeited. This answer assumes that the contract you speak of contains the ordinary forfeiture clause. You can put the owner to the trouble of foreclosure, and in that way gain a few months' time, probably, but it is not at all likely that you would gain a year.

Undivided Ownership

A and B own a piece of land undivided. Both have families. Should anything happen to either of them would it tie up the land so the other could not sell? If so, how can one get around this?—Subscriber.

The only way for A and B to avoid possible complications is to divide the property so that each has a certain definite quantity in place of an undivided interest. The death of one would not necessarily cause complications, but it is possible that it might do so.

No Security

I have been freighting distillate for a mining corporation. Can I hold empty Standard Oil barrels for freight due me from the corporation?—Subscriber.

You cannot hold the Standard Oil Company's barrels for money due you from the corporation.

Water of School District

Please advise through your paper how B shall proceed to get permanent legal right to water under following conditions: Trustees of district school offer B privilege of using water of school on B's private property if B will develop the present school water system. Before B goes to expense of developing he wants to be sure of a permanent water right. —Subscriber.

It would seem to me that a grant from the trustees of a certain proportion of the water or of a certain interest in the land and water, where the water is developed, would secure to you the right you desire.

Stockholders' Liability

To what extent can an individual stockholder in a mining corporation, director or non-director, be held responsible for debts incurred by the corporation if other stockholders and the corporation as a whole cannot settle?—Subscriber.

An individual stockholder is liable for his pro rata share of the debts of the corporation, that is to say, his proportion of the debts is the same as his proportion of the issued capital stock. If he owns one-third of that, he is liable for one-third of the debts. The fact that the other stockholders cannot pay their proportion has nothing to do with the question. Of course, if the corporation could pay that would relieve the stockholder, but it is because the corporation cannot pay that the stockholder becomes obliged to pay his proportion. A director can be held liable for more than his proportion, provided he has, in bad faith, joined in creating a debt which should not have been created, and which is in the nature of a fraud upon the company, otherwise a director's liability is the same as that of any other stockholder.

Waste Water

A runs waste irrigating water across B's land on to C. To whom does C look to abate the nuisance, A or B?—Woodlake.

It seems to me that the proper course would be to sue both A and B, as B has no right to permit water to be discharged from his land on to C, even though A is the source of the water, and A should take proper precautions to prevent his waste water from escaping and damaging C.

Inheritance

Parents deed property to son, keeping the right of a life maintenance if they want it from property. In case son dies first, to whom would the property go? What share would son's wife get, when there are no children?—Subscriber.

If both parents joined in the deed to the son and provided therein that they should have a life interest in the property, the life interest would belong to them equally unless restricted by the terms of the deed. In the event of the death of the son first, leaving no other heirs, the property would go to the father and mother in equal shares.

Household Department

HOW BIG WAS ALEXANDER?

A few of the older ones of us who got our first inspiration in the old "Deestrict" school will recall the following found in McGuffey's Readers. Who the author is is unknown and some may say that it has no place as a classic, but the unknown author of more than a half century ago certainly had a horror of the awful tragedy of war, which is felt by some twentieth century people:

How big was Alexander, Pa,
That people called him great?
Was he like old Goliath tall,
His spear a hundred weight?

Was he so large that he could stand
Like some tall steeple, high;
And, while his feet were on the ground
His head could touch the sky?

Oh! no, my child; about as large
As I or Uncle James.
'Twas not his stature made him great,
But greatness of his name.

His name so great? I know 'tis long
But easy quite to spell;
And more than half a year ago
I knew it very well.

I mean, my child, his actions were
So great he got a name
That everybody speaks with praise,
And tells about his fame.

Well, what great actions did he do?
I want to know it all.
Why, he it was that conquered Tyre,
And leveled down her wall.

And thousands of her people slew,
And then to Persia went,
And fire and sword on every side
Through many a region sent.

A hundred conquered cities shone
With midnight burning red;
And strewed o'er many a battle-ground
A thousand soldiers bled.

Did killing people make him great?
Then why was Abdel Young
Who killed his neighbor, training-day,
Put into jail and hung?

I never heard them call him great.
Why, no—'twas not in war,
And him that kills a single man,
His neighbors all abhor.

Well, then, if I should kill a man,
I'd kill a hundred more;
I should be great, and not get hung
Like Abdel Young before.

Not so, my child; 'twill never do.
The Gospel bids be kind.
Then they that kill and they that praise
The Gospel do not mind.

You know, my child, the Bible says,
That you must always do
To other people as you wish
To have them do to you.

But pa, did Alexander wish
That some strong man would come
And burn his house and kill him, too,
And do as he had done?

And everybody called him great
For killing people so—
Well, now, what right had he to kill,
I should be glad to know.

If one should burn the buildings here,
And kill the folks within,
Would anybody call him great
For such a wicked sin?

THE WOMAN WHO WANTED TO KNOW.

Once there was a woman—just an ordinary woman, who had had but meager advantages in the way of an education, but who was vividly alive to the people and things around her.

This woman seemed to have an insatiable desire to learn of life, of people, of things. Everything interested her and brought forth the query, "Why is this so?"

The woman was a wife and mother of four children. She did her own housework, cared for and nursed the children through the usual childish indispositions, cooked, washed and sewed; but her ruling passion seemed to be to learn, to know, to understand the deeper meaning of the things she saw.

She could not spend much time outside of the home; but she grasped eagerly at every opportunity to talk to strangers, especially those from a different walk in life; her straightforwardness and intelligent interest drew out these strangers and chance acquaintances, and they gave her of their best. Among these were the doctor and nurses who attended her during her stay at a hospital. They answered kindly and intelligently her eager questions, and at the close of her stay at that hospital she had acquired a working knowledge of practical nursing. Some of the things she learned were the use of antiseptics, fever thermometer, something of dietetics, how to make the bed and care for the room of a patient, and she had lost no time in learning it. Much of this recently acquired information she put into immediate use in the care of her babe, who thrived and grew and became one of her most interesting problems.

Even visits to the dentist had their compensation in what she learned there.

The generally despised agents—book or otherwise—that came to the house were given courteous hearing, and their wares as well as business methods were noted and jotted down in her book of knowledge. The wayfarers who came to her door to ask for work or food (or both) were questioned and counseled and encouraged to talk. In this way she learned much of a side of life of which she would otherwise have had no intimate knowledge. Much concerning

The Largest and Best on the Coast

causes and motives for crime became clear to her in this way, and served as a foundation for later research along these lines. Time did not permit extensive reading; but what reading she did was carefully chosen and thoughtfully perused.

If strangers of note visited the community, in the capacity of lecturer, social worker, or entertainer, she lost no opportunity to meet and discuss with them, not her work and her surroundings, but theirs. Frequently it was her pleasure to invite such people to her home, which, although plain in the extreme, gave freely of its hospitality. The good will, naturalness and spontaneity found there, atoned for any material lack.

Another source of joy and information was to be found in the casual acquaintances met during her short trips on train or boat. Some really delightful and interesting people came into her life in this way, if for only a few hours. Once it was a mother of three small children who was coming west to join her husband who had come to find and make ready the new home; another time a family coming to spend Thanksgiving with relatives; a college president, a soldier on parole, a civil engineer, a mining expert, a druggist—these are a few of the people who were glad to discuss their particular lines of work with so interested a listener. Their talks were of different things, their language and phrasing different—and she always took a keen delight in these glimpses into the lives of others. The effect it had upon her outlook was broadening and enlightening.

Let it here be said that whether the reason lay in the fact that this woman had fine discrimination in the choice of even her chance acquaintances, or whether it was due to the general excellence of mankind, she never suffered the least annoyance as a result of her unconventional meetings with strangers.

After years of this unremitting search for knowledge, the woman found that she had acquired much that would be helpful to others.

She missed sadly the foundation work of what is commonly known as an education. She longed for a means to express to others whom she could not meet, some of the wonderful truths she had learned. If she could only write books or paint wonderful pictures to tell to those people out in the world the good, the pure, the beautiful possibilities of life, in this wonderful world!

"What is the purpose of my thirst for knowledge?" she would often think, "my desire to know and understand; if knowing, I cannot tell it; if understanding, I cannot help others to understand?" And at times she was puzzled and unhappy. But at last the light dawned upon her. She knew and was satisfied. She was her husband's stay and confidant, her children's teacher and delightful companion, a joy and inspiration to her many friends, and a sympathetic and intelligent companion to all with whom she came in contact. The great and lowly were alike benefited by her rich store of experience; the children of the neighborhood smiled shyly and spoke confidingly to her; the young folks told her of their hopes and ambitions, sure of a sympathetic listener and a wise confidant. Best of all, her small daughter asked of her one day: "Mamma, will I be like you when I am a woman?" "Why do you ask, darling?" she questioned. "I think perhaps you will be much like me." "Well," said the child, "you are the prettiest and best woman I know, and I don't want to be like any one else; I want to be just like you."
—Pacific Homestead.

WORTH TRYING

Strawberry Shortcake.

Two cups sifted flour, one-half teaspoon salt, four level teaspoons baking powder, one-fourth cup butter or part lard and part butter, one cup of milk; sift flour, salt and baking powder out in the lard, then add the milk to form a soft, light dough, turn on a lightly floured board and pat into shape, roll the dough thin with a few movements of the pin; place one layer in a pie tin, brush with melted butter and lay another over it; bake in a quick oven for fifteen minutes; split the cake and lay one-half on a platter with the crust down, spread with berries crushed and sweetened; lay on the other half of the cake, put on another layer of berries and cover with sweetened whipped cream or a strawberry meringue.

Banbury Tarts.

Make a rich pie crust, roll out and cut in a circle. Place in the center a large spoonful of the following: one cup raisins, piece citron, chop these finely, add one cup sugar, juice and grated rind of a lemon, one egg beaten light. Brush over the top with milk in which a little sugar has been dissolved.—Mrs. Alice E. Myers, Angiola.

Lemon Pie.

Two-thirds cup sugar, grated rind and juice of one lemon, yolks of two eggs beaten together; cook on top of stove until creamy. When done, remove from stove and add the beaten whites of two eggs. Fill baked crust and brown in oven.—Mrs. W. B. Ricker, Riverside.

Three-in-One Dessert.

This is a delicious dessert which combines the desirable qualities of pudding, pie and cake in one dessert.

Line a deep pie plate with your favorite pie crust and fill with the following mixture: Mix together one cup sugar, two heaping tablespoons flour and pinch salt. Add butter size of an egg, melted, and yolks of two eggs. Beat all to a cream. Add to this the juice and grated rind of two medium-sized lemons, one cup milk and lastly the whites of two eggs, beaten stiff. Bake one-half hour in rather slow oven. The result will be a flaky crust on the bottom, a delicate layer of cake on top and a dainty lemon filling between. Served with lemon sauce you will have pudding, with meringue you have pie, or simply frosted you have cake.—Mrs. Lily Inglehart, Bellflower.

Simple Strawberry Shortcake.

Make a nice paste for the crust roll out in thin cakes about the size of a breakfast plate. Put in a layer of strawberries with a little sugar sprinkled over, then another layer of dough, another layer of strawberries and sugar, with a top layer of dough. Bake slowly and eat for luncheon or dessert with sugar and butter sauce, or sweetened whipped cream.—Miss Helen A. Lyman, Pittsfield, Mass.

To hurry the cooking process of anything cooked in a double boiler add salt to the water in the outer boiler.

SANITARY WARMING CLOSETS.
PAT. APP. FOR.
MAJESTIC
MAJESTIC
WITH OR WITHOUT LEGS.
ONE QUALITY; MANY STYLES AND SIZES.

Cooking is so important!

Good cooking helps the health and happiness of your family.

Surely you should have a range that will enable you to do your *best* cooking.

"Majestic" makes good cooking easy. It is not just "so much metal put together to hold fire"; each part is scientifically built to do its work **just right.** Made of malleable and charcoal iron, metals that resist rust and wear three times as long as ordinary range metals.

All joints cold-riveted (no putty used)—a Majestic stays tight—holds the heat in, maintaining uniform baking heat with least fuel.

The Majestic provides perfect baking qualities, plus fuel-saving and work-lessening features that you cannot get in ordinary ranges. The little extra it costs is more than repaid by the years longer wear that it gives.

The health and happiness of your whole family is effected by the range you buy. Investigate **thoroughly.** There is a Majestic dealer in every county of 40 states; if you don't know the one near you, ask us, and get "Range Comparison" explaining Majestic ranges fully.

Majestic Mfg. Co., Dept. 203 St. Louis, Mo.

More and hotter water!

Majestic water heating front is fitted with eight hollow pins that extend right into the fire; giving greatest water-heating surface of any range made; heats more water much quicker and hotter than ordinary water front.

Boy Today
Man Tomorrow

The health of the growing boy depends upon the food you give him. See that he drinks Ghirardelli's Ground Chocolate. He'll like it and it will do him lots of good. It is a real health food and drink and costs no more than those beverages that are universally considered to be harmful. Begin serving Ghirardelli's tomorrow. It will please every member of the family.

In hermetically sealed cans.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day

D. GHIRARDELLI CO.
Since 1852 San Francisco

Despite the European war there is no raise in prices.

HAY

Under date of September 5 Scott, Magner & Miller say:

Receipts of hay for the past week were 5060 tons, approximately the same as the previous week. Demand remains light, especially for this time of the year. There is a great deal of hay still in the fields. In many sections, owing to the low prices, farmers have decided to stack it up and cover it as best they can without baling, awaiting a better market. In some sections baled hay is being stacked also.

Fancy hay of either red oat or wheat is scarce and sells readily, while all other grades drag along.

Considerable alfalfa from the river districts is arriving. Owing to the low prices of clover hay dairymen are holding back, figuring to buy cheaper later on.

Offerings of straw are large in country districts, but demand for same is very light.

We quote the average wholesale prices on carload lots of new crop hay on today's market, as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	8.00@9.00
No. 2 Wheat or Wheat and Oat	6.00@7.50
Choice Tame Oat	10.00@11.00
Other Tame Oat	7.00@9.00
Barley	6.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, new	.30@45

CURED FRUIT EXCHANGE BULLETIN

SAN FRANCISCO, Cal., Sept. 1, 1914. —Since our last bulletin conditions in Europe have become worse, and everything now points to a prolonged struggle for supremacy, the result of which will be much hardship and suffering, and those conditions existing over there will, naturally, affect business in this country in a greater or less degree.

There is a great difference of opinion as to the effect of the war on domestic goods used for domestic consumption. Some think that it will make business much more brisk, others that it will have a depressing effect. Business men who have been told that trade will be bright as soon as transportation is wholly or partially restored are apparently more and more skeptical in the matter. They point out that with England policing the North Atlantic as she is, there is no real lack of transportation facilities any longer, but an abundance of ships can be obtained to send products back and forth, if shippers want to send them. The real trouble lies in financing the shipments and in securing aid from foreign countries in restoring a regular and reliable course of business that would permit sales to be made safely when the goods are actually able to be delivered in Europe.

It is argued that there is no use in sending goods to other countries unless those countries are in position to make payment for the goods in some acceptable kind of value. If such payment cannot be arranged for on a regular and settled basis the expected prosperity due to the selling of our products abroad at high prices will not materialize.

Our bankers are using more than ordinary care in advancing money to their customers, and when they do it is only on the most highly approved security; in this they are strictly within their rights.

We have been fortunate so far in having our export shipments go forward and have every hope of continuing to have them do so.

Conditions in the southern states are not good on account of the lack of money, which is necessary for the harvesting of the cotton crop, but arrangements are now under way with the help of the government, by which bankers will finance the farmers and enable them to save their crops. This will make conditions better and will tend later towards bringing a more settled condition in all lines of business.

We cannot too strongly call to your attention that on account of conditions not being quite normal it is most necessary that you use extra care in drying and caring for your fruit, and that in packing you watch your grades so that at all times your grade will be higher, rather than lower, than the standard called for, for some buyers when the market is lower at time of delivery than when the order was placed will examine cars most critically and try to find some excuse for complaint so that they can obtain an allowance or a lower price.

Dried apricots are a trifle weaker on account of war conditions in Europe; peaches a trifle firmer.

Dried apples are going to be very plentiful, and are being quoted at low prices, which also makes it all the more important to keep up our standard of pack, as the eastern trade prefers apples to either apricots or peaches, especially when the prices are lower.

Prunes are now thought to be much less than first reports, and it is estimated that even should the war make it impossible for any large export demand, this country can consume at fair prices the supply on hand, but we are looking later for a good export demand from England, who has to get her supply from this country, consequently the prune market is being held firm with prospects for higher prices.

The home markets for dried fruits are in fairly good shape, and while at first buyers were somewhat timid they are gradually getting more confidence, so we would urge growers who are not members of the exchange to consider carefully market values before disposing of their crop, and hold out for full values.

Don't get frightened and dispose of your crop at low prices to speculators —the darkest hour is always before dawn, so remember that our success is your success, and that we must all stand together and not get weak-kneed.

Every means will be employed to make you believe that others are doing better than you, but true cooperation will win and will ultimately place you in a position where you will be able to receive a just reward for your labor.

Citrus Fruit Market

LOS ANGELES, Sept. 9, 1914.

There is a slightly better tone to the orange market, but there are still great quantities of deciduous fruit being offered. As an indication, yesterday in New York there were 30 cars of California oranges sold and 122 cars of Pacific coast fresh deciduous fruit. Of course all eastern producers are also furnishing great quantities, though many of the earlier fruits are out of cold storage. There are perhaps 3,000 cars of Valencias yet to go. With proper distribution these will command fair prices.

Great quantities of Mediterranean lemons are still coming. Due to arrive during the next few days in New York, 100,000. Notwithstanding that speculators are trying to hold up prices so that they may not suffer too severely on lemons bought earlier on speculation. In many markets lemons are commanding 50 cents per dozen retail, and some jobbers are breaking boxes and selling to retailers in even less than box lots.

Shipments.

Shipments of oranges to date from Southern California since November 1, 1914, 35,873; lemons, 2,677; total, 38,550. To same date last season, oranges, 12,840; lemons, 2,063; total, 14.903. Total citrus shipments two years ago this date, 33,556.

NEW YORK, Sept. 8.—Twenty-eight cars valencias, 1 grapefruit, 1 car lemons, sold. Market strong on Valencias. Prices 10c to 15c higher. Market unchanged on lemons. Weather fair.

REPORTS OF EXCHANGE

(Continued from Page 245.)

ting a sufficient number of people to use oranges and lemons, and this can most thoroughly and economically be accomplished by giving the public the reasons why they should use them, and suggesting to them the various ways in which they can be served. Advertising is not a mysterious thing. It is simply telling the people the truth about the thing we have to sell and telling them through those channels in which they have confidence and to which they are accustomed to look for information and guidance.

Support of University Department of Agriculture.

The growers must give their loyal support to the state university and to the United States department of agriculture in their investigations of the difficulties which beset the production and handling of the crop. The progress of the industry in solving these problems will be proportional to the support which these institutions receive. No wiser appropriation of public funds is made than that which relates to the upbuilding of the agricultural resources of a staate.

Cooperation of Members.

The California Fruit Growers Exchange is vital to the permanent stability of the 200 million dollars invested in the citrus industry. It is the one predominating factor, formed and managed by the growers at the cost of operation for their own benefit, that has solved the most important fruit-marketing problems for the industry in the past. It has developed an international distributing and marketing system and an international advertising campaign that looks to the future with a view to assuring the permanence of the growers' investment. Only when the growers stand shoulder to shoulder in meeting their problems systematically can they be worked out successfully.

STATE FAIR

Mr. McClanahan of the Pioneer Incubator Company informs us that he is planning for a striking exhibit of Pioneers and poultry supplies, to be made at the coming state fair. There will be demonstrations in charge of Mr. James D. Yates, who is to be poultry judge at the Modesto show.

The Keen Engine Buyer Invariably Selects the Western

Simplicity, reliability, low operating cost—those are the vital points to be considered when buying an engine, and that's why the **Western** has gained such widespread popularity. On the up-to-date farm, in the shop, at the mines, in the oil field—in fact, wherever a dependable engine is needed you will invariably find the **Western.**

For ease of operation, smooth running, fuel saving, power, absence of trouble, etc., the Western is without an equal. Types and sizes from 4 to 180 h. p.

You should have our illustrated Catalog. It gives complete details.

the machine**

Yuba Ball Tread Tractors are built by the Yuba Construction Company in their plant at Marysville, California.

Back of this concern is ten years' experience gained in building gold dredges, suction dredges and irrigating pumps.

To mining engineers, Yuba Gold Dredges are the standard.

**THE YUBA
BALL TREAD TRACTOR**

The average earning capacity of the largest gold dredge is one thousand dollars a day. A delay caused by faulty construction or broken parts is expensive.

The same engineering skill and the same mechanical accuracy that reduces possible delays from such causes to a minimum in Yuba Gold Dredges are exercised in building Yuba Ball Tread Tractors.

As for the machine—there is a booklet describing it.

-what successful Imperial Valley ranchers say about

Milford Valley Lands

at $30 per acre

A FEW days ago a group of Imperial Valley ranchers pictured above visited the lands of the newly opened Milford Valley irrigation project. They are men who took advantage of the opportunities that existed in Imperial Valley several years ago. **They made money.** A few weeks ago they heard about Milford Valley of Southern Utah. They went up and made a thorough investigation, as only **practical men** can do. The Western Union Night Letter reproduced above was sent by them to Curtis Hopgood, an Imperial Valley rancher, who was unable to make a trip to the valley, but requested them to wire him immediately if conditions were absolutely as represented.

On Main Line of Salt Lake Railroad — adjoining Live Town of Milford.

These men bought generously of the rich, red, loamy lands of beautiful Milford Valley. They knew that this $30 land (with a perpetual water right at $70 per share, payable in 12 years, if desired) would be easily worth $250 or more an acre when in alfalfa. They appreciated the value of a water maintenance cost that should not exceed 30 cents per acre per annum. They reveled in the glorious mountain air of the valley —elevation 4971 feet. They enthused over the **pure, soft,** sparkling drinking water. They realized that this was a **successful man's land.** They knew that land sold on a cash basis would eliminate the homesteader class of settlers. They bought within sight of Milford, a progressive city—an important railroad center. They were alive to the crop possibilities—in alfalfa, potatoes, grain, dairying, hog raising and deciduous fruit culture. They saw another **Imperial Valley opportunity** in Southern Utah. That they bought land right on the spot is a wonderful tribute, a splendid testimonial to Milford. **Imperial Valley men surely know good land!**

This land opportunity is going fast. If you buy now you gain an overwhelming advantage over the late comers—by buying suburban to the city of Milford. Write today for illustrated booklet which tells about the best valley in the west—about land that is being sold at only a fraction of its real value. Write today!

Sixty-First California State Fair

Live Stock Display Greatest Ever Made in California. Many Other Departments Hardly Up to Former Years. Attendance Rather Lighter than Last Year.

CORRESPONDENCE BY THE EDITOR

The live stock industry, especially the dairying end of it, is surely coming to its own in California. There is a great display of beef and dairy arrivals, as there is of swine, now on at the sixty-first California state fair. Sheep and goats, about the same as former years. The horse exhibit, especially the drafters, is magnificent. But this is enough for me to say of the animal classes, for State Representative J. H. Lettow of the Cultivator staff will give them more particular attention both this week and next. This week neither of us will do more than refer to the general features, for the fair is just getting under full swing as we write.

The attendance the first two days has been rather light, though the side attractions are about as heretofore. The head-on collision of two old locomotives is scheduled for Wednesday. Thousands will attend then. The usual cowboy aggregation is tying, roping, lassoing, riding and wrestling with "wild" steers. Then there are many other attractions—some really good — especially the band music. Sunday was given over to band contests.

On the pike, where sideshows and pay attractions are staged, are a few features which are not highly educational, or rather may be educational in the wrong direction. Granted that the concessionaires are there to amuse and get the money, yet in a great institution supported by taxpayers' money and in the main supported because of educational value to agriculturists and where whole families are urged to attend, it is not wise to undo in one line the good which the fair is supposed to do in another.

For instance, there are several booths where Teddy bears, tango dolls and other fuzzy things dear to children are displayed by the thousands, raffled to children and others at so much per chance. I believe the courts have held that this method of securing or not securing merchandise is legal, while if the stakes are coin it would be gambling and prevented under the law. It's a wise head which can make the fine distinction. The question arises, "Do the children make the distinction or are they getting a little education not strictly primary?" This feature, like that of the diving girls, regarding which severe criticism has been given, might have been omitted and I believe with advantage.

But I must hasten and give particulars nevt week. I promise not to moralize more this week.

Machinery hall is not filled as heretofore, neither is the traction engine and implement field. But there is fine work being done. A monster "combined" with a 30-foot cut, holds a crowd, and when the big traction engine climbs the 45-degree incline people stand back at a respectful distance.

The race track is not so big a feature as years ago, though there are some fast ones here and the few races pulled off attract crowds.

There are about 600 entries in the poultry class. Judge Hines says these make an excellent showing—far better than last year as to quality. Pigeons, judged by R. V. Moore, are fine, as are the quail and other exhibits of the state game and fish commission.

One distinct shock is felt on entering the automobile pavilion. It is not half filled. A few remarkably fine exhibits are made, however.

Yes, the fair has many fine features, but listen to a word about live stock.—C. B. M.

* * *

By J. H. Lettow

Of course you want to know something about the stock department of the state fair this year, and the writer, having gone over the field as thoroughly as possible within the limited time alloted him, will endeavor to give, as near as he can, the status of the stock contest now being held on the fair grounds. It is with pleasure that he notes the progress being made in this field, and especially along the lines that will bring the most money to the farmers and ranchers of the state. True enough, we have state fairs galore, but when we have the quality of the stock presented such as is seen here this year, it is virtually an education in itself, not only to the old-timer in business, but to many who are but recently branching out in a new field. We have a great future before us as stock men, and as the field is practically unlimited at the present time the writer is going to draw a little comparison between this fair and its stock exhibit and those of eastern states.

First, he will mention the interest being shown in these departments by those in daily attendance and the enthusiasm manifested by the on-lookers, for many go into rhapsodies over the fine quality of the stock presented. We find, as we go through the barns and around the pens, a degree of quality which would be the envy of many a prominent eastern stock breeder. Here we note the animal whose sire stands at the head of the world's champions, there a dam whose ancestry shows the highest of breeding, and ofttimes one which may have been brought from the east after extensive winnings there. Two prominent eastern stock men, now visiting

(Continued on Page 280)

Different Varieties of Walnuts for California

Address of Dr. W. W. Fitzgerald Before Recent State Fruit Growers Convention at Davis.

This subject is about as difficult as the present status of the different makes of automobiles. Whatever make of machine a man drives he is apt to think the best. So with the man who grows a particular variety of walnut; he is apt to think that variety is the best.

In speaking of the present status of the different varieties of walnuts we have to consider soil, climate, and moisture conditions. It is true that we can regulate moisture conditions, but soils and climate we cannot change; so in considering the different varieties we must keep in mind where they are to be grown and the character of the soil they are to be grown on, as some of our best varieties that do well on heavy soil and plenty of moisture will not prove satisfactory on lighter soil and poor moisture conditions. Likewise some varieties that produce good white meated nuts in a cooler climate will produce inferior nuts in a very hot climate.

Production.

The first thing to be considered in judging the different varieties of walnuts is their producing quality. I do not mean by this to consider a large producer of an inferior nut, but a heavy bearer of a good quality nut. A tree that produces only a few fancy nuts is not to be considered commercially. A fancy variety may bring a few cents per pound more and may make up what it would lack in the number of pounds it would produce providing it was not too shy a bearer. A fancy variety producing only from 50 to 75 pounds on full bearing trees at 25 cents per pound would not compare favorably with a variety which produces 200 to 300 pounds at 12 to 15 cents per pound. The relation between the quality of nuts and the quantity of nuts produced should be carefully considered in choosing a variety for planting, especially as the demand is increasing for fancy stock.

One should not judge a variety by the fine appearance of a picked sample of nuts without considering the quantity in which they are produced. The best variety is one that will produce annually a large crop of the most desirable type of nuts. Unfortunately we do not have all the good qualities in any one variety or we would not be discussing this subject. We have to choose a heavy producer with a good quality of nut. One important point is that young trees often produce larger nuts than they do after the tree becomes older, so one should judge nuts from a tree that has been bearing for a few years.

We should also consider the age at which the tree comes into bearing, as great differences exist in different varieties as to what age they begin bearing. Some varieties begin to produce nuts even in the nursery and give a commercial crop within three years from planting in the orchard, while other varieties are several years later in coming into bearing.

Size and Weight of Nuts.

The next important consideration is that of the size and weight of the nuts. Number one grade walnuts are those that will not pass through a one-inch square opening, while those above one and three-sixteenths inches, which are generally considered as budded nuts, bring considerably more per pound and the demand is growing for this quality of nut.

The weight of the nut is equally important since this varies widely in nuts of the same size. Some of the largest varieties are considerably lighter in weight than others in which the nuts are smaller. A desirable nut should be well filled with plump white meat without too much air space between the shell and the meat. A comparatively heavy shell is more desirable than a very light one since the nut is better protected from being mashed in handling and less susceptible to perforation disease, which is one of the most serious troubles of

Citrus and Tropical Fruits

PRODUCING HUMUS IN THE SACRAMENTO VALLEY

Written for the California Cultivator
By J. W. Mills.

The soils of the Sacramento Valley are as a rule richer in humus than those of the drier parts of Southern Californa, still the soils not classed as bottom lands are not rich in humus, and it is quite necessary that they should receive a liberal replenishment as often as possible when the material must be grown. Stable manure is cheap, but there is even a greater dearth of it here than in the south, considering the area that will call for it.

Excluding the Tule basin, perhaps 95 per cent of the valley lands are depleted in humus. The red, yellow and brown soils pack and get hard as bone during the summer when not cultivated and where grazed close.

Where volunteer crops are grown the native legumes consist chiefly of burr clover on adobe, sandy and loam soils, Lupinus micranthus and the natural pink clover, Trifolium ciliolatum on sandy loam. Unless we have plenty of rain in October and November, burr clover is a failure and the other plants named above do not make a satisfactory growth. When irrigation is given in the fall, a good crop is a certainty. On a gravelly clay loam none of these make a satisfactory growth even under the most satisfactory conditions.

Non-Legumes.

We have tried vetch and peas for winter growing crops but cannot get the tonnage. Alfalfa makes a magnificent growth on both sandy and clay loams and is one of our best volunteer humus makers as regards tonnage.

However, barley when handled properly will no doubt give as much if not more than any other cultivated crop. Two years ago we sowed 50 acres of young orange grove to barley in September, then furrowed it out four feet apart for spring irrigation in case it should need it. The soil was spotted, red sandy loam, red and black adobe and a hard gravelly clay soil. When the barley commenced to make stalks in March we turned on the water and soaked till the moisture met between the furrows. In April the barley was beginning to head when we started to plow. With the aid of chains we managed to get most of it under till the last week of plowing when it was in full head and even with a man's shoulder. This land had been pastured as bare as a floor for ten consecutive years and would not hold the moisture or make a good dirt mulch before we grew this crop. After plowing the barley crop we had to use disk cultivators the following summer. Even they would sometimes bunch the straw during the first few cultivations making it necessary to scatter it with a fork. It must be remembered that the crop would have made from three to four tons of cured hay per acre. The straw soon became brittle on exposure to the sun and by midsummer the disks were going axle deep through a mixture of chopped straw and soil. The barley was so thick and heavy that it was impossible for it to decay when plowed under. This experience convinced us that barley is about as good as any non-leguminous plant for making humus.

Alfalfa.

In the Corning district alfalfa is becoming the favorite crop for orchard lands. It is not thought advisable to plant it in orchards till they are three or four years old, but after that it is planted to get a thick stand, right up to the trunks of the trees. The land is corrugated with a simple home-made implement as soon as the seed is sown. The corrugations are made two feet apart and are about four inches deep. The small furrows made in this way lead the water evenly over the ground and still the land is smooth enough to permit easy and comfortable mowing and raking. Almonds, peaches, apricots and prunes take on a wonderfully healthy and vigorous growth, and the crops are abundant and of high quality. This method requires a large amount of water. The alfalfa is cut and made into hay, but commercial fertilizers are added at irrigation periods. There is a loss of one crop of hay, as irrigation is discontinued for a time before the fruit matures, just as though no alfalfa were growing. Persons who have followed this practice for several seasons are highly pleased with results. The usual spring rush of plowing and getting the land in shape for summer is confined to turning on the water, cutting, raking and hauling hay. Striking examples of this practice can be seen at the Brubaker ranch and the W. W. Shoal place at Corning, Tehama County, peaches, prunes, olives, almonds and apricots being the fruit grown.

This reminds us of the experience of Mr. Smith of Old Cucamonga in San Bernardino County. He had an orchard of Moorpark apricots which never bore enough to pay expenses, so he planted it to alfalfa in the fall, expecting to pull out the trees during the winter. The press of work prevented pulling the trees and the result was he had a satisfactory crop of Moorparks. We never knew if it just happened to be a Moorpark year, or if the trees continues to produce.

Alfalfa in Citrus Groves.

Mr. Wm. M. Bristol of East Highlands planted alfalfa in his Washington navel grove about seven years ago but we have never seen any report on results in the Cultivator or any other way, so presume it was not satisfactory.

CITRUS CULTURE IN THE ISLE OF PINES

A subscriber of the Cultivator, Mr. Clinton McQueen of McKinley, Isle of Pines, has written regarding the Cultivator being a favorite with many citrus growers of that beautiful island. Regarding citrus conditions there he touches especially upon the pomelo. He writes:

"The Isle of Pines is destined to become a famous citrus country, especially in the production of grapefruit of unsurpassed quality. It ripens earlier here than in Florida, shipments going forward by every boat at the present time, the reason being, I believe, our frostless climate. The lowest I have ever known the thermometer to go was 45 degrees."

In the Isle of Pines Appeal we also

—control Red Black Purple and other SCALE by spraying with ZENO

The Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

CONSULTING and Analytical Chemist
MARK WALKER, B. S.
211 West First Street Los Angeles

note reference to citrus conditions there and that the citrus industry is becoming important enough so that there is talk of forming a citrus exchange which shall affiliate with the Florida exchange.

"The Florida Citrus Fruit exchange has made an offer to the Isle of Pines Fruit Growers exchange of the use of its immense sales organization in the marketing of Isle of Pines fruit. Such an agreement would be of inestimable benefit to the island from many standpoints and would also lengthen the Florida shipping season. Island fruit would be marketed with the seal of approval of the Florida exchange and would necessarily have to conform to the high standard of pack set by that association. The boxes would also bear the grower's individual mark or the brand of the Isle of Pines Fruit Growers exchange.

"Instead of having the Florida growers as the bitterest rivals of the Isle of Pines they would by this affiliation become our staunchest supporters and in case of annexation to the United States, the Isle of Pines would be able to assume her proper place either as a county of Florida, or as an independent territory.

"The Florida exchange has agents and salesmen in all principal markets and in case of low prices or an overloaded market in one section they are in a position to divert shipments to a more advantageous market. They also sell some fruit at the packing houses as northern buyers are continually in the south during the fruit season. Florida growers and packers have had years of experience in packing and Florida fruit sets a high standard in excellence of pack, and island growers would be protected against poor and unscrupulous packs."

FERTILIZERS AND CROPS

Fertilizers and Crops, or The Science and Practice of Plant-Feeding, by Lucius L. Van Slyke, Ph. D., Chemist, New York Agricultural Experiment Station, published by the Orrange Judd Company, New York, at $2.50, postage added.

The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $3.35.

"During the past generation there has been intense and ever-increasing activity among agricultural investigators in the study of problems relating to plant nutrition and soil fertility, covering all the various phases, chemical and biological. Much work has been done in making practical application of the results of investigation to the use of plant-foods in the growing of crops. As an outgrowth of this activity, numerous books relating to soils, crop growing, fertilizers and kindred subjects have appeared, some treating certain limited aspects in much detail, others discussing all phases in a general way. For some time, however, there has existed marked evidence of a growing demand for a book which should not only assemble in a connected way the important facts and principles relating to soil fertility and plant nutrition, but which should follow such a preparatory foundation with a systematic, reasonably thorough study of plant-foods in relation to practical use in crop growing. In the attempt to meet such a demand, this book has been prepared. Effort has been made to keep in mind the needs not only of students in agricultural schools, but even more, of the larger class of student farmers who are directly and vitally interested in the profitable production of crops."

The above is from the preface of the book. It gives a very clear statement of the needs of the time and the effort to meet them. The book is made up of four parts, the first having to do with the factors of soil fertility, relations of plant food to soil fertility, chemistry of plants, soils and plant foods; part two, with its eight chapters, touches upon sources and composition of materials used as fertilizers; part three, with six chapters, deals with factors in the solution of fertilizing materials; part four, with a dozen chapters, touches upon the practical use of fertilizers in the growing of individual crops. The book is fresh from the press and one of the very finest on its subject.

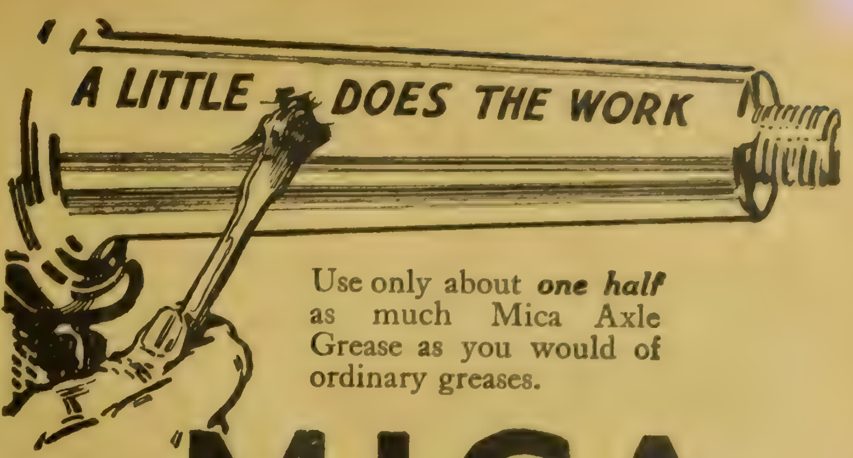
EXPERT ADVICE

By V. L. Deane, Seabrook, Texas

I notice an article in the Cultivator of August 20 from a subscriber who complains of "expert advice" on the destruction of Russian thistle, which reminds me of some sad experience I have had with "expert advice."

About a year ago I noticed a fungous disease on a young grapefruit tree in my citrus orchard. Not knowing what it was I sent some of the infected leaves to the Texas state experimental station and was informed by them that it was the "Texas orange scab" and could be easily controlled with Bordeaux mixture. I commenced spraying immediately, and now after a year of frequent sprayings my entire grove is infected. The grapefruit trees are dying, as they seem worse affected than the hardier oranges. Had I known the seriousness of this disease I would have grubbed up the first tree that was infected and burned it root and branch and could have saved the balance of my grove. Now I will probably lose my entire orchard from following "expert advice." The last time I sprayed my trees I was determined to kill or cure, so I sprayed with a pure stock solution of Bordeaux, about 10 times stronger than the standard 5-5-50 formula. Strange to say, it did not kill the trees, neither did it kill the scab, so I am positive now that Bordeaux is absolutely worthless as a remedy or preventative for the Texas scab.

I would strongly advise California to enforce a strict quarantine against Texas nursery stock, for if this disease gets established in your state it will ruin the citrus industry. Texas scab is the worst disease I know of; white fly and scale are a joke compared with scab.



A LITTLE DOES THE WORK

Use only about *one half* as much Mica Axle Grease as you would of ordinary greases.

MICA
Axle Grease

forms a smooth, durable lubricating film on the spindle. It has to be renewed only occasionally. That's because the ground Mica in Mica Axle Grease resists heat and friction, and makes the grease last longer. Mica Axle Grease won't "melt down" or wear off easily. It won't form rust or paste on the spindle. A quality product of the Standard Oil Company. Ask your dealer for it.

A Free Book for the Man who wants to know how to raise larger crops

Here is a book which will tell you a great deal about soil—will tell you something about soil which will raise large crops and tell you the reason why poor soil produces small crops.

You should have this book and study it. You can't just read it and get the facts because the information it contains is too valuable for a casual reading.

Send for it today. It is free for the asking. You will be surprised at the wealth of information it contains for you.

Here are a few items which this book tells about:

It tells:—

About the 14 elements necessary to sustain plant life.

The 10 necessary food plant elements which must be in the soil.

What time is for.

The effect of iron upon the color of the vegetation.

How potash produces starch in plants.

Why phosphorous is necessary for plant-life to live.

Necessity of nitrogen in the soil.

How plant-life cannot utilize the elements of the air if there are not sufficient mineral elements in the soil.

How plants feed.

What humus is.

The theory of cultivation.

Bacteria in the soil.

What available soil fertility is.

Maintaining and increasing fertility.

And 100 other points not mentioned in this list.

DIFFERENT VARIETIES OF WALNUTS

(Continued from Page 267)

the walnut grower in recent years.

This is a non-development of the outer hard layer of the shell. The hard shell is not actually perforated, but rather fails to develop. This disease has become more prevalent in the last few years and affects principally the nuts with very thin soft shells. Nuts that are prone to crack easily and have a fine light shell are more or less injured in handling.

It is also to be considered that since walnuts are sold by the pound, the heavier the shell the greater the weight, and the more the returns for a given number of nuts. The Grenoble, strictly speaking, is a Mayette variety. It is not a long nut, somewhat broader at the base than at the apex. This is not very important, however, since the smoothness, symmetry and uniformity of the nuts affect their appearances more than does their shape. An ideal nut should be quite smooth, free from outside ridges and other irregularities of surface, and all nuts should be of the same general shape and appearance, giving them uniformity and individuality. A variety in which the nuts are decidedly uniform so that the variety is easily distinguished and recognized, even by the consumer, has a marked advantage over one in which the nuts are of all sorts of shapes so that only an expert could distinguish the variety.

The color of the shell is not so important, as the trade demands bleached nuts even though they may have an attractive appearance without bleaching. By being bleached they are all brought to about the same color. The quality of the meat is of considerable importance, however, as nuts with the lightest colored meats are considered more desirable, while those that are dark, even though plump and of good color, are discriminated against. There is no doubt but what the dark meated varieties will become less popular as more of the lighter colored ones are produced. The flavor of the meat varies considerably in the different varieties and is of much importance in a high class fancy trade. Commercially there is not much importance placed on their flavor except when they are bitter, and this is a most undesirable quality and should be guarded against in choosing a variety.

The most important qualification of a variety from a strictly commercial standpoint is that it should be a uniformly large producer of nuts, the majority of which will not pass through a one and three-sixteenths inch square mesh, well sealed even though hard shelled, and uniformly well filled with meat of light yellowish brown color or not darker than light brown or amber. For fancy trade the nut should be of an attractive uniform shape and color, with a fairly smooth surface and particularly high quality, with agreeably flavored meat and with no bitterness.

The next important consideration is the choosing of a variety that is resistant to blight. This is a bacterial disease which affects the young growth when it first puts out and requires for its development moist weather conditions. It is not very prevalent in northern and central California on account of the drier atmosphere, but under the same conditions some varieties are more blight resisting than others, probably due to their vigor. As a rule the late blooming varieties are free from blight as they come into bloom when the weather is drier and the blight can make little headway, while the earlier varieties blossom during a moist season on account of rain and fogs which are favorable periods to its development. Certain varieties are spoken of as being immune to the blight, but while there is no such thing among walnuts as absolute immunity when conditions are favorable for the development of blight, yet some trees do show quite a marked resistance and should be given precedence on this account.

While there are many seedlings of promise scattered throughout the state, both of the Santa Barbara soft shell type and the French varieties, I will only consider the prominent varieties that have been thoroughly tested.

Santa Barbara Soft Shell.

Originated by Mr. Joseph Sexton of Santa Barbara. It is a seedling grown from a sack of nuts which probably came from Chili. This is the prevailing type of seedling walnuts of Southern California. The nuts vary in size and are irregularly shaped. Trees come out early in the spring, having a growth of six to eight inches by March 20. The trees vary in their bearing qualities, are very susceptible to blight and are not very desirable for this reason and for their irregular bearing.

Santa Rosa.

A chance seedling introduced by Luther Burbank at Santa Rosa. The tree is a very thrifty grower and very precocious, but the nuts are small on old trees and susceptible to blight, consequently not very desirable.

Placentia.

The Placentia which originated in Placentia near Fullerton was extensively propagated by Mr. J. B. Neff of Anaheim. It was a seedling of the Santa Barbara soft shell type. The nut is of medium size, averaging one and one-fourth by one and one-half inches, runs largely to average size; has very few large or small nuts; form is regular and somewhat elongated; the surface is quite smooth and the ridges not very prominent; the nuts are uniform in size, but vary considerably in shape and smoothness, some quite elongated, others nearly round, but the shell is thin and strong. The nuts are poorly sealed. The septum is almost free from the shell so that the nut can be easily opened with the fingers and the whole meat taken out intact. Kernel full size, quite smooth with comparatively few convolutions, averages 50 per cent or more of the total weight of the nut. Flavor mild and pleasant with no pronounced character. The tree makes a vigorous growth and the foliage is very abundant and thrifty. The foliation period is quite early, about the same as all Santa Barbara seedlings, having a growth of about six inches by the 8th of April. It comes into bearing early and is a heavy bearer and the harvest season is early. It is very susceptible to blight and the nuts are sometimes badly perforated. This is the best type of nut in Southern California.

Ware's Prolific.

This variety also originated from a Santa Barbara soft shell seedling at Garden Grove. This is rather a large nut even on old trees. It is oval, quite elongated, base and apex equal breadth, pointed at both ends. It is quite smooth and has conspicious longitudinal grooves which give it a characteristic apperance. The nuts are very uniform, but poorly sealed, meat is decidedly plump and well filled, averaging about 50 per cent. Flavor is mild and pleasant, but the meat is quite dark, ranging from amber to dark brown, and in many cases nearly black. The tree comes out early in the spring, make a fairly vigorous growth forming much fruit wood, which makes the tree low and spreading. It is well filled with fruit spurs and the foliage is abundant and thrifty. The harvest season is early. It is one of the most precocious varieties we have, coming into bearing when very young. It is subject to blight the same as the other soft shell seedlings and very prone to perforations. This nut is worthy of consideration on account of its heavy and early bearing, as a tree for interplanting for a few years.

Chase.

This originated in a tree near Whittier and has been widely propagated by Mr. Rideout of Whittier. This original Chase nut is medium to large size on young trees, but small on older trees. It is broadly oval or rounded; apex and base of equal breadth, apex terminating in a short and pronounced point. Surface is quite smooth, nuts not so very uniform. They are badly sealed and perforate on young trees. The meat is plump and well filled, averaging nearly 50 per cent of the total weight. Flavor is mild. This tree comes out earlier than the average Santa Barbara seedling. The growth is very vigorous and thrifty and the foliage abundant. The nuts are harvested early and the tree is a very heavy bearer, but is subject to blight. It is a good type of the Santa Barbara soft shells except that the nuts are small.

El Monte.

A Santa Barbara soft shell seedling which originated near El Monte. It is a somewhat irregularly shaped nut with pronounced ridges. The nuts are well sealed and filled with light colored meat. Comes into bearing early and bears quite heavily. The tree is a thrifty grower, comes out early in the spring about the same time as the other Santa Barbara seedlings and is harveted early. Its blight resistance is about the same as the other Santa Barbara seedlings. It is desirable on account of bearing early and heavily, but the nut is quite homely.

Neff's Prolific.

The original tree is a Santa Barbara soft shell seedling in Mr. J. B. Neff's orchard at Anaheim. Mr. Neff selected this tree on account of its heavy bearing and not being so subject to blight and perforation as the ordinary seedlings. The nut is of good size, well sealed, exceptionally heavy and well filled with light colored meat of good flavor. This variety has not been propagated very extensively and is a good variety on account of its heavy bearing, although the nuts are homely, being rough and irregularly shaped.

Franquette.

The French variety has several types. The one most commonly known as the Vrooman from the Vrooman grove at Santa Rosa was first propagated by John Rock at Niles. The Leibs of San Jose are also large growers of the Franquette. The Oregon Nursery company controlled the scions and nuts from the Vrooman grove for a number of years. This variety, being well advertised and highly recommended, has been extensively planted on the Pacific Coast of recent years, not only as grafted trees, but as seedlings. Since there were not enough grafted trees to supply the demand many resorted to planting seedlings. The eagerness of planters to set out walnuts caused Franquette seedlings to be planted. Of course the result of this, as with all other seedlings, is going to be variable and disappointing.

The Vrooman Franquette nut is medium to large and retains its size on old trees. Decidedly elongated, pointed base, much broader than the apex, surface medium smooth with sutural ridges. The color is a light yellowish brown. Their uniformity is strong and their characteristic shape makes them easy to identify. The nuts are well sealed, but thin shelled and are readily cracked. The meat is moderately plump and the shell well filled except at the point of the nut. Flavor is sweet with a characteristic nutty flavor. The consistency of the meat is also soft or oily. The buds just begin to swell about April 15. The harvest season is late, often being caught by the fall rains. It is a fairly vigorous grower. The precocity is not pronounced. It is one of the slowest of the varieties to come into bearing, has a thick husk and abundant foliage which protect the nuts from sunburn. It is one of the best proven varieties for central and northern California and has been considerably tested. The quality of the nut is the best. With its uniform shape, pretty color, white meat and firm seedlings, the Franquette is of the very highest quality and were it a heavy bearer it would be an ideal nut.

Mayette

This, like the Franquette, is a French nut. Like the Franquette, there are several types of Mayette, due probably to being originally propagated in France by seedlings. They differ widely in character but have a general resemblance. The Mayette, like the Franquette, is characterized by the shape of the nut. In the true Mayette type the base of the nut is decidedly flat and square, cut so that it can be set on the base without falling over. The nut rounds broadly to a point at the other end, giving it a sort of a flatiron shape. In a good Mayette the meat is plump, white, well developed and of a good flavor. It averages about 50 per cent of the total weight. The shell is thin and strong and well sealed. The Mayette comes out late in the spring, about a week or 10 days before the Franquette, but ripens at least three or four weeks earlier in the fall than the Franquette. The different types vary considerably in rapidity of growth and amount of foliage, also in their bearing qualities, most of them being light producers. Mr. S. F. Leib of San Jose has some imported trees, and there are several types that were imported by the late Mr. Gillet. Trible brothers of Elk Grove also propagate two or more types which were imported from France. Mr. Leonard Coates of Morgan Hill has propagated quite extensively the San Jose Mayette, which is one of the most attractive and handsome walnuts grown in California. It is of large size, above the average of most varieties, has a typical Mayette form with smooth surface and uniformity. The nuts are not any too well sealed, have a thin shell and the meat is small in proportion to the shell. This type is of slow growth and scant foliage and not a heavy producer. I have a Mayette imported from France, which is most promising, as the nut is a good type, precocious and a heavy bearer. If it continues its present standard it will be a leader.

Bijou

This is also a French variety, having the characteristics of those varieties, that is, coming out late in the spring. As a rule they are very rough and poorly filled with meat and are not considered a commercial nut. There are, however, Bijou seedlings, which have a smoother and better nut such as the Acme, which is fairly smooth, rather elongated at the apex than at the base and almost square in end view. The shell is heavy and it is fairly well filled with meat, averaging about 40 per cent of the total weight. It is not of any special value for commercial purposes.

The Klondyke is another walnut of the Bijou type. The Willson Wonder, propagated by F. C. Willson of Sunnyvale, is perhaps the best Bijou type we have. The nuts are very large, but smoother and better filled than those of the Bijou. It is extremely precocious, coming into bearing early. The nut is smooth and symmetrical, being broader at the apex than at the base and nearly square in end view. The flavor is mild and sweet and the meat white. These nuts are very large. They sometimes measure two by three inches. The tree is a slow grower and of scant foliage, probably due to its heavy bearing qualities. It is like the other late varieties, quite blight resisting in dry climates. The trade claims this variety is too large for a commercial nut, being more of a novelty.

Payne

This nut is an accidental seedling discovered by George C. Payne of Campbell. It is of the Franquette type and is an excellent nut. It comes out rather early in the spring and is a heavy bearer, but blights badly.

Parisienne

This is a French variety, introduced by the late Felix Gillet. The nut is rather long and pointed, somewhat resembling the Franquette, but broader in the center. The shell is light, the meat is fairly well filled, light color and a good flavor. Like the other French varieties, it is late in coming out in the spring. This is a very good nut, its greatest drawback being that it is a light producer.

Concord

This variety originated in a seedling tree on Mr. George M. Westcott's place at Concord, Contra Costa County, the original tree coming from Felix Gillet. It has been propagated by Leonard Coates of Morgan Hill. Its nuts are not large; they are broad and short with a square cut base, slightly wider than the apex and fairly smooth. The nuts are fairly uniform and are well sealed. The meat is plump, white and well formed, filling the shell completely. The tree comes out medium late, midway between the Placentia and the Franquette. The growth is thrifty, although the tree ultimately does not become very large. The nuts are harvested early in the fall. It is a good bearer and comes into bearing early. Like all late varieties it is fairly immune to blight. This variety seems well adapted to hot sunny regions and light dry soil. It is a very good variety, although the nuts are small.

Eureka

This variety originated in a seedling tree at Fullerton from nuts obtained from the Meek place, near Haywards, California. The desirable

"STEEL KING"
MOTOR PLOW

Saves time—money—worry—means better crops. Reasons are obvious when you consider what this excellent farm machine will do for you. The "Steel King" is really an all around farm machine.

Work of 8 Horses!

It will actually do the work of eight horses — do it quicker — and with much less expense.

Only 1 Man Required!

One man can operate the "Steel King" with perfect ease. All operations controlled from driver's seat.

8c per Acre!

Impossible, you say? But a demonstration will prove this statement. Will run at full speed on 4 cents per hour.

$1050 Los Angeles!

You get also an economical first price as well as the lowest upkeep cost. Will do harrowing, discing, plowing, seeding, sawing, pumping, almost anything you want done.

Motor Car Flexibility!

Drives just as easily as a motor car — turns quickly — gets way back into the corners. Light weight — yet extremely sturdy and powerful.

Write today for complete information. It will pay you to learn about the "Steel King"—the up-to-date—the money saving farm and ranch machine.

RURAL NEEDS

Written for the California Cultivator
By Ernest Braunton.

Every rural community is daily confronted with some serious drawback that is hardly ever existent in the city, yet there are needs common to both in which the country could easily excel the city. One of these, quickly and cheaply solved, lies in the provision of roadside trees and other highway embellishment.

It has often occurred to me that the initiation, even the maintenance of this work, might be left to the schools, with a strong probability of signal profit to both schools and the community in general. One most crying need in some localities is a better country school, and how may attention be called to such need more strikingly than by showing a high appreciation of the various needs of the neighborhood and a strongly expressed desire to stand in the vanguard of the improvement forces?

In one of the counties of Oregon the several schools are each to build and maintain a stretch of good roads, to demonstrate the value thereof, so that the people will demand that the whole county road system be kept up to the standard set by the schools. But how much more easily and more cheaply could highway embellishment be carried on, for, as a rule, rural highways in California are already on a high plane of improvement and maintenance.

Better methods of marketing farm products is now one of the greatest needs, but school children cannot grapple with such problems any more than they could with the one of providing a better system of agricultural finance, but roadside planting is closely akin to home grounds improvement, and either one actively pursued should encourage the other. The influence of the school on the home is unmistakable. It has clearly been proven that better sanitary methods on the farm have been brought about largely because the constituted authorities have forced similar methods on rural schools. Now is the proper season to begin all civic improvement work, more especially if it is to be prosecuted through or by the aid of school children, for the autumn term of school is about to begin, the weather is cooling and all will feel more active than during the heated period Californians still call summer. Schools may easily, and without direct outlay, secure experts who will advise them as to proper methods of highway planting, the best trees to use. Experienced planters, growers, pruners, etc., could from time to time supplement the work of the teachers in giving practical talks or demonstrations "on the firing line" of how best to persue the work in detail. This movement should be taken up as an entirety by the county officials, so as to be uniform throughout and bear the stamp of governmental approval. Such a movement would prove a powerful uplift in rural improvement.

Moving Plants.

The present is a splendid time for transplanting trees and large plants of nearly all classes. It is now that the nurseryman digs palms, etc., for winter trade. Usually these are boxed, but often are sacked only and "heeled in" in sand or sawdust to await the later market demand. While all other palms should have a ball of soil taken with the plant, all species of Washingtonia are as easily established without soil. It is of far greater importance to see that the trunk is carefully handled so that no fibers are broken, or, like a "strained" watermelon, decay may easily be induced and the palm die by reason of destruction of the life-carrying ducts in the trunk through breakage. This often occurs through allowing a tall palm to fall heavily to the ground. Nearly all the leaves should be cut away and the remaining central shaft of leaves tied up to prevent drying out too rapidly, as they would do if allowed to droop singly.

When the roots are cut below the pumping of water into the trunk is stopped and the trunk begins to shrink, continuing to do so until the roots again start action. Therefore water every day near the top of the trunk so that all the "pockets" may be filled and the trunk surrounded by a jacket of moisture from which it may freely absorb. This will prove a great aid in re-establishment of the vital functions of the plant. Do not, however, water too much in the center of the green top or excess of water during the period of dormancy may induce decay. If this center rots so the leaf spike comes away, the palm will surely die. This seldom occurs in the case of Washingtonias as they are hardy subjects, but it is a common cause of death in the cocos and other fine and tender palms.

Formal Citrus Trees.

If one wishes formal trees in the garden why use bays imported from Europe and which serve no purpose but as ornaments, and even then are of far less value than many other plants readily available? Sentiment alone is responsible for the use of bays, for they have for many centuries been clipped into formal shapes.

In my opinion some of the privets have them "beaten to a frazzle," especially the species handled in local plant depots as Ligustrum Nepalense. And again, what's the matter with some of the citrus family? For smaller plants use the Kumquat and no bay ever grown could surpass in beauty the willow-leaved Mandarin. Even the Dancy Tangerine and others of the same class could be utilized for larger subjects. In many parks of Europe, notably in Paris, one may see aged citrus trees in giant boxes, where tree tops have been formally pruned for long years. When the golden crop of fruit hangs thickly upon clipped citrus trees bearing both leaves and fruits of small size, the effect is much more charming than that of any bay ever grown. At least one firm of growers in Los Angeles has given citrus trees a trial as herein outlined and the free use of them in the future will, I am sure, displace many bay trees.

Use Native Annuals.

There are many places on the average farm where may be grown a good collection of native California wild flowers, spots otherwise neglected and too often given up to weeds. Last winter I sowed a spot in my own garden to a mixture of 20 kinds of native flowers, put up in trade packets by a Los Angeles seedsman. It was a tiny plot, 10x20 only, yet it proved a great source of pleasure to every member of the family and was admired by many visitors who will sow a similar plat at the beginning of our rainy season. Try it once and be convinced of the ease of attaining a rich garden of flowers at little cost and no subsequent care or trouble.

Propagate Herbaceous Plants

Get a box of sand; now. Try out the propagation of all the herbaceous plants in the garden of which you desire a larger stock. This is the best time of all the year for the increase of nearly all this class of plants. You will be agreeably surprised with the results of the experiment and your flower garden will rapidly assume a finer appearance and gain a deeper hold on the affections of every member of the household. Do not have your sand-box water tight, for the sand must have drainage, and do not stand the box where the soil upon which it sets will prevent such drainage, a very common mistake.

Burn or Bury Litter.

Clean up all garden litter and either burn or bury it so as to have no harbor for insect and other pests; also to destroy weed seeds, and further, to provide more organic matter in the soil. Too little attention is paid to this phase of gardening and the result is poor starved soils often covered with weeds, and the crops ravaged by insect pests.

Save Ashes and Plaster.

Often have I seen wood ashes and old plaster dumped in holes or waste places on the farm while potash and lime were being purchased by the farmer for both ranch and garden. All this is wrong. While old plaster is excellent for all soils it is doubly valuable on heavy sticky ground. Wood ashes are valuable in lime and potash content for any and all soils and for nearly all crops of plants.

Why Century Plants?

While I would not discourage the use of ornamental plants on the farm, nor inveigh against a collection of prickly plants, I have seen many neglected specimens of century plants and other bearers of spines and prickles that no one seemed to care for. The places of these might very profitably be taken by artichokes, one of the finest delicacies of the garden, a plant of considerable ornamental value that will fit in with almost any garden scheme. One thing must, however, be observed. Artichokes need an abundance of water if good buds are to be picked.

WEEDS IN WALKS

Rock salt or blue vitriol is a cheap and effective agent for destroying weeds in walks, garden paths, etc. The best method of procedure is to boil the salt or blue vitriol in water, one pound to the gallon and apply the solution boiling hot, with a watering pot that has a spreading nozzle This will keep the weeds and worms away for two or three years. Put one pound to the square yard at first and afterwards a weaker solution may be applied when required. Gas liquor is another cheap medium, but has an offensive odor and may injure the roots of trees if carelessly used.—Henry A. Doerner, Colorado Agricultural College.

TO THE CITRUS FRUIT GROWER

Who wants to raise MORE FRUIT and BETTER FRUIT

PRACTICAL EXPERIENCE over many years has DEMONSTRATED to the satisfaction of all keen observers of causes and effects, that SCALE CONTROL is BEST OBTAINED by FUMIGATION with HYDROCYANIC ACID GAS.

CORRECTLY FUMIGATED TREES

PRODUCE

MORE FRUIT AND BETTER FRUIT

CORRECT FUMIGATION may be had only through RIGHT METHODS. The GROWER when fumigating SHOULD KNOW .

THAT **chemicals** of **known strength** and **quality** are used, and in **proper quantity, rightly proportioned** to secure correct gas delivery from the generator for safe, efficient fumigation.

THAT **tents** are in **perfect condition** to insure against excess **gas leakage.**

THAT **correct dosage** is always applied—this is best obtained with **marked tents and careful measurements** so that reasonably correct calculations will be made of the cubic space under a tent over a tree—and that the DOSAGE is made to FIT the CUBIC SPACE to be filled with Hydrocyanic Acid Gas.

THAT **dosage charts scientifically figured** are available for field use.

THAT different scale pests, and the same species in different stages of development, require varying gas volume under tents; to at all times get highest killing efficiency this gas volume is controlled by the cyanide dosage and mixing formula for cyanide, acid and water.

THAT **the mixing formula** (the proportions of cyanide, acid and water) MUST be RIGHT, as too **little acid for a given** amount of cyanide **interferes** with the **chemical reaction, too much** means **waste, too little** water causes **explosive generation** and the crystallizing (freezing) of residue, **too much** water REDUCES the GAS DELIVERY, **wastes cyanide** and **impairs efficiency.**

THAT the proportions of cyanide, acid and water to secure maximum gas delivery from a given amount of cyanide have been scientifically worked out and should be carefully followed, except

THAT when operating on SMALL TREES with a cyanide dosage of 3 OUNCES and under the formula should be changed—double the amounts of acid and water.

THAT reasonable **supervisory watchfulness** while trees are being treated will insure more careful attention to details by field operators, with **better clean-up results.**

THAT inspection of fumigated trees to determine scale **killing results** should be made not earlier than **seven** and not later than **fourteen** days after being fumigated.

THAT the inspectors should be **competent, painstaking** and **thorough**—MEN **with** the CONSCIOUS KNOWLEDGE that **important responsibilities rest upon them.**

THAT damages to trees and fruit, while infrequent and small, when compared with benefits obtained, do at times occur, and in most cases **through no fault of the operator;** such damages, to a certain extent at least, should be at the **cost of the grove owner.** Reasonable treatment of the field operator, with **less demand** for **reputation** by the grower, will secure for him better scale-killing results, or, say a MAXIMUM BENEFIT at a MINIMUM COST.

THAT wind is a factor in spreading scale pests; tests made in a unique way show young scale carried as far as 600 feet (possibly farther, **but not satisfactorily proven).**

THAT the **block system** in cleaning infested districts is the only safe method to **insure** getting **full value** out of a clean-up campaign.

THAT **the** grower **by** watchful intelligent and painstaking study of conditions and correct co-operation with field operators will secure **better results** from the money expended for the **fumigation** of his citrus acreage.

THAT the PERMANENCY of the CITRUS FRUIT INDUSTRY hinges on **correct control of scale pests,** and this control is best obtained through the FUMIGATION OF THE TREES WITH HYDROCYANIC ACID GAS.

THAT many testimonials similiar to the following are in our files:

W. H. Jameson Co., Corona, Cal., says:
"In reply to your favor of the 18th we have to say that we are strong believers in fumigation with Cyanide, as we consider it the most practical way to control the scale pest that has as yet been discovered."

Mr. Hemphill, manager for C. C. Chapman, Fullerton, Cal., said:
"Correct fumigation spells clean trees, more and better fruit, highest prices in the market, and larger returns for the grower."

Mr. O. B. Griffin, assistant manager Leffingwell ranch, Whittier, Cal., said:
"The fumigation of citrus trees is a profitable investment for the citrus fruit grower, and properly done will bring large returns."

A. F. Call, Corona, Cal., said:
"Replying to your inquiry, I did not suppose any California Citrus Grower in this day and age would doubt the absolute necessity of fumigation for scale. Any man who has scale and cannot fumigate should sell out as soon as possible, for there is no place for him in the business."

Mr. W. C. Hendricks, manager, Azusa Citrus Association, Azusa, Cal., says:
"The cost of fumigating citrus trees should not be considered as a part of the expense account in the handling of a citrus grove, but rather as an investment that brings speedy and large returns on the money paid out."

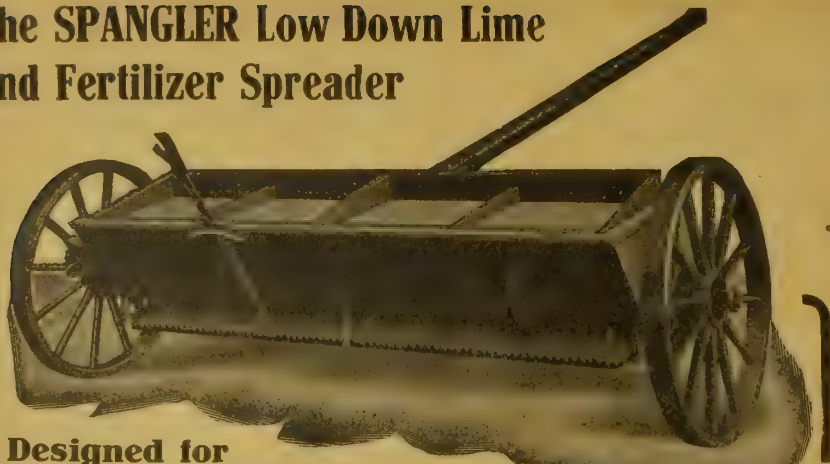
CYANEGG FOR FUMIGATION R&H Co TRADE MARK

F. W. BRAUN, Los Angeles, Pacific Coast Agent,

THE ROESSLER & HASSLACHER CHEMICAL CO., New York City.

Cyanegg and A. A. C. Co.'s Sulphuric Acid are Guaranteed as to Strength and Quality.

The SPANGLER Low Down Lime and Fertilizer Spreader



Designed for Spreading

Lime, Ashes, Commercial Fertilizers,
Cotton Seed Meal, Gypsum, Nitrate of Soda

A Perfect Broadcaster
One Lever Adjustment

Sows Any Quantity from 150 to 4000 Pounds of Material per Acre

Continuous Chain Reel Feed Beats Lumps Fine, and Prevents Arching or Choking. Spreads Evenly at All Times

Made in sizes from 4 feet wide up to 10 feet. The five-foot implement specially recommended for orchard purposes, spreading material 6 feet, or one foot more than width of machine. The larger sizes are adapted for spreading Gypsum or Phosphates on ALFALFA stands.

Smaller sizes equipped with shafts, larger sizes with poles. Light Draft, Low to the ground. Easily filled hopper. No parts to get out of order. Implements suitable for ORCHARD work, $38.00 delivered; others in proportion to size.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300% Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen — gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Farm Economics

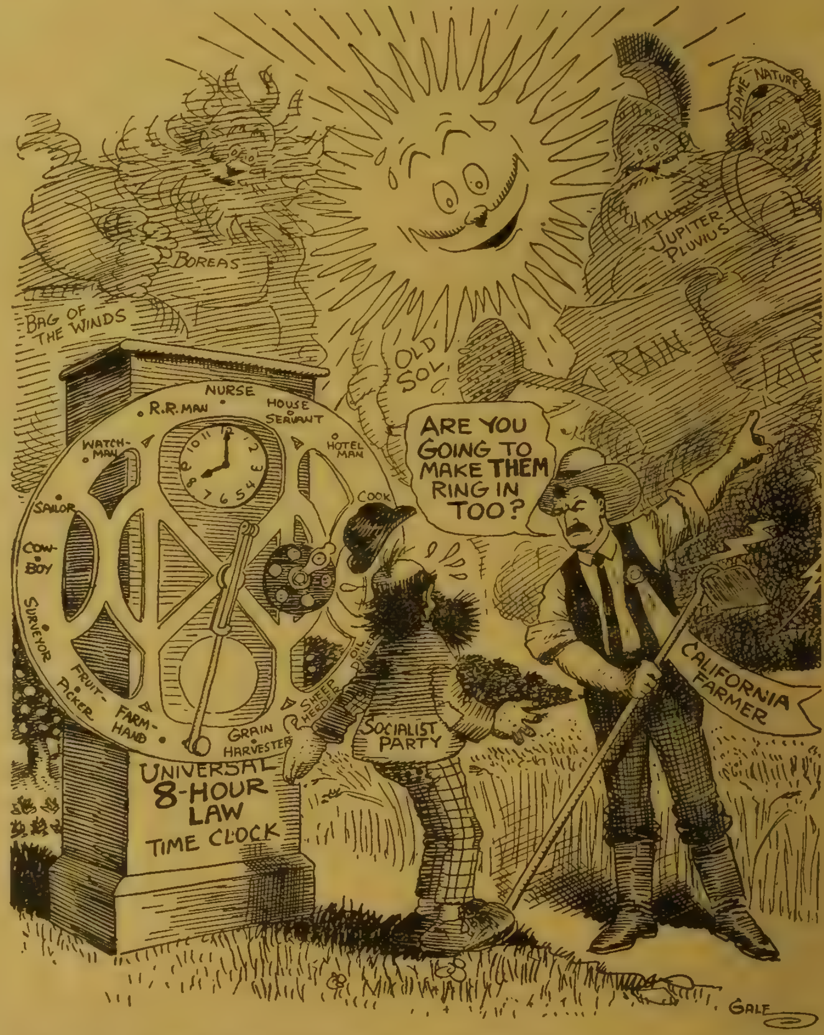
"MR. FARMER, WE'LL ABOLISH ALL PROFITS"

Objections by the farmers throughout California that the proposed "Universal Eight-Hour Law," by its sweeping and drastic terms, would be impracticable, unjust and ruinous to all agriculture, has called forth a remarkable statement from Thomas W. Williams, state secretary of the socialist party, which political organization placed the law on the ballot by petition and is now urging its adoption at the November election. In the course of a signed argument for the drastic law, he says:

"I want to break this information gently, Mr. Ranchman, that your ownership of the land is only temporary, any way. We are not agitating an eight-hour day because of its effect on your profits; we propose the abolition of all your profits. The sooner you learn this the better."

Secretary Williams also says: "We cheerfully admit that a universal eight-hour law will, to an extent, increase the cost of living." As no general raise of wages is hoped to be accomplished at the same time hours are reduced, the opponents of the law urge that the worker will suffer doubly, having his living cost increased without a greater income, and in many instances, under piece work and payment by the hour, suffer a heavy reduction of earnings.

FARMING BY A TIME-CLOCK.



OVER 80,000 PRACTICAL WHITE FARMERS OF CALIFORNIA SAY THIS LAW IS IMPRACTICABLE AND MEANS RUIN TO OUR AGRICULTURE.

Vote "No" on Universal 8-Hour Law, Proposition No. 3.

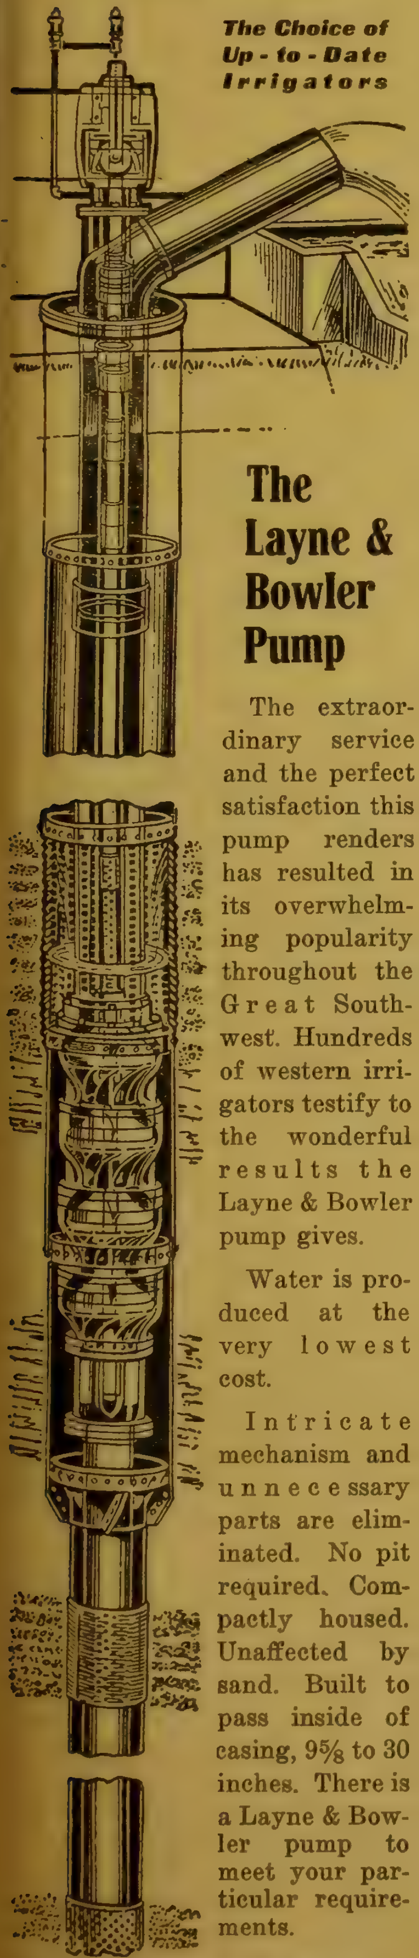
Workers Also Oppose It.

Statements by socialist party proponents of the eight-hour measure that "the small farmer in reality favors the law" has called forth a formal denial by the Farmers and Fruit Growers' Federation, which organization also declared thinking workers very generally oppose the legislative experiment. The federation statement says:

"The statements just now being promulgated by advocates of the universal eight-hour law that small farmers favor its adoption is wholly unjustified by our very extensive knowledge of conditions in agriculture. Our membership includes over 10,000 soil-workers in every part of Southern California, and we have been in closest touch with farmers of all classes in every section. Over 40,000 soil workers are enrolled in active organized opposition throughout the state. In every section all manner of soil workers, growers of fruits, vegetables, nuts, beets, beans, grain, hay, live stock, and general agriculturists, have denounced the law as impracticable, dangerous, unfair and calculated to ruin our agricultural prosperity. This organization has on file scores of signed statements by farmers, large and small, in which they explain in detail just how the inflexible, restrictive penal statute would hamper and injure their operations.

"If all profit is to be abolished, as sought by the socialist campaign manager, obviously there can be no successful farming, and there can be no employment of labor under any

The Most Popular Pump on the Market



The Choice of Up-to-Date Irrigators

The Layne & Bowler Pump

The extraordinary service and the perfect satisfaction this pump renders has resulted in its overwhelming popularity throughout the Great Southwest. Hundreds of western irrigators testify to the wonderful results the Layne & Bowler pump gives.

Water is produced at the very lowest cost.

Intricate mechanism and unnecessary parts are eliminated. No pit required. Compactly housed. Unaffected by sand. Built to pass inside of casing, 9⅝ to 30 inches. There is a Layne & Bowler pump to meet your particular requirements.

Everyone interested in irrigation should have our illustrated Catalog No. 30. It tells all about this pump. Write for it today.

Layne & Bowler Corp.

900-910 SANTA FE AVE.
LOS ANGELES, CAL.

conditions of hours or wages. Many farmers have stated that the sweeping eight-hour measure will in fact abolish all their profits and compel them to abandon their ranches, either selling outright or leasing them to Orientals who are able to escape the provisions of the law and labor without restrictions through the subterfuge of 'cooperative partnerships.'"

Labor Would Be Greatest Sufferer.

The "Sacramento Bee," a constant newspaper champion of labor, in an editorial opposing the universal eight-hour law as "premature and unwise," says:

"Theoretically and as a gift from Utopia an universal eight-hour law would be a splendid thing. So would the international reign of socialism. But in this workaday world neither is practical at the present stage. If an universal eight-hour law and socialism were in the saddle in this state today, it would not be long before the workers themselves would ask for the repeal of the one and the exile of the other. Thinking toilers do not favor the universal eight-hour law now. They know it would do incalculable injury to business; that it would bankrupt many industries. And they feel that in the ultimate analysis the greatest sufferers would be the laboring classes themselves. The chances are this initiative law will be defeated at the polls in November. It should be. It was not born of union labor, but socialism. And while many union laborites are for it, it may be found their unionism has become wedded to and been swallowed by socialism. On the other hand probably the great majority of the masses of union labor in California are opposed thereto on the ground that, while at the present time grossly unjust to the employer, it would be inimical also to the best interests of the employe."

SOME LIVE SUBJECTS FOR DISCUSSION AT FARMERS' MEETINGS

1. Do country schools train boys and girls for farm life?
2. Which is better on the farm, bathtub or automobile?
3. Does speculation help to fix farm prices?
4. Cost and benefits of an Agricultural College education?
5. How can consumer buy direct from producer?
6. Do mothers teach daughters thorough housekeeping?
7. How does the experiment station help the farmer?
8. How to beautify homes, school houses and churches.
9. Does the farmer know how much he has invested in the farm?
10. Is the renter or retired farmer the least interested in the welfare of the community?
11. Who has the best-kept farm home in the community?
12. Are teachers and preachers practical in their work?
13. Do housewives favor the teaching of domestic science?
14. Why do many farmers neglect to paint their buildings?
15. Why do farmers permit weeds to grow in roads and fence row?
16. Do farmers make use of the parcel post service?
17. How can the country fair be improved?
18. Is it a disgrace to keep a scrub animal on the farm?
19. Is there such a thing as farm arithmetic?
20. Does agricultural extension work help the farmer?
21. Does the housewife use labor-saving devices as much as the farmer?
22. Do some farmers waste their labor and profit by planting poor seed?
23. What is the strongest influence that keeps boys on the farm?
24. Should the school house be made a meeting place for the community at least once a month?—Colorado Agricultural College.

Catalogue No. 54 C
P
Pomona Pumps for Deep Well Pumping
Pomona Manufacturing Co. Pomona, California

If interested in deep well pumping you can have a copy of this book by writing for it. It contains information about the POMONA DEEP WELL PUMP, and also valuable data on irrigation subjects. When writing ask for "Catalogue No. 54C," and state the depth of your well and its location.

The Pomona Double Action Deep Well Pump

is of the plunger type with reciprocating plungers, traveling in opposite directions, the one with a slow up-stroke, the other with a quick down-stroke, and a substantial "lap," thus having the descending plunger in place ready to receive and carry its load before the ascending plunger has reached the end of its stroke, traveling a substantial "dead" distance together, the one receiving, the other giving up its load gradually. Cylinders, valves and all other parts are made of the best materials that money will buy, and are built to stand up under heavy deep well lifts and to give years of satisfactory service.

Pomona Pump Oil

is a pure Pennsylvania product, refined especially for our particular use, and should always be used in connection with Pomona Pumps. If you require a thoroughly reliable lubricant, write us for prices and further information.

Pomona Gates and Valves

are made by us in a complete line of sizes for use in cement pipe irrigation. Special valve catalog "C" will be sent free on request.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction. and the subscriber must have mentioned the Cultivator when writing the advertiser.

AT THE FAIR

Three members of the Cultivator staff are on the grounds of the state fair this week. They have in action two cameras and will give to Cultivator readers next week something of an idea of the agricultural resources of California as represented in this annual expositon. There will be no effort to give a complete review of the fair, for that will be impossible in the limited space at our command, but there will be enough of interest to make next week's paper one of exceptional value.

POTATO CONVENTION.

State Horticultural Commissioner A. J. Cook has sent out announcement of the speakers at the Potato Emergency Convention scheduled for Stockton, September 25 and 26. The convention will be addressed by Dr. A. J. Cook; W. H. Volck, Horticultural Commissioner of Santa Cruz County; William Garden, Horticultural Commissioner of San Joaquin County; William Wood, Horticultural Commissioner of Los Angeles County; N. V. Shear; Dr. W. A. Orton; John Graf and Prof. William Stuart, experts of the United States department of agriculture; Dr. Appel, a German authority; Prof. Ralph E. Smith and Prof. E. M. Jaffa of the state university; Frederick Maskew of the state quarantine service; John Irish, George Shima and George Atherton. The sessions will be held in the court house.

FARMING BY THE CLOCK

If our readers will turn to page 274 they will see a sketch of the California farmer asking a few important questions of the socialist party. Will it be able to force Dame Nature, Jupiter Pluvius, Old Sol, and some others to ring in on the time clock so that the farmer can live and market any sort of a crop? The more generally the voters inform themselves as to the real inwardness of this proposed eight-hour law, the more voters there are against it, and while it may not be wise to say anything which will lessen activity against this measure, we cannot help but feel that the vote against it will be overwhelming. The energetic workingman is beginning to realize what it will mean to him; scarcely a farmer in the state but realizes it means absolute ruin. The manufacturer, while not hit so hard, is opposed to any measure which will mean a crippling of his forces in time of need to push for bigger business.

"On November 3 vote no on No. 3."

PRIZE PHOTOGRAPHS

The first prize photograph contest has brought sufficient commendation to show that it will be immensely popular. It has encouraged the sending in of a large number of other photographs for the next contest, which will take place in the first issue of October. There are already in hand enough to show that it will be no easy task to choose the winners. The photos show California farm life in many phases.

Those who have not yet sent in photographs should be sure to get them to this office prior to September 24. This gives only the required time to get photographs into the engraver's hands and ready for publication in the issue of October 1. Note that the prizes are the same as heretofore: $2.00 for the best photograph of Pacific coast farm life, $1.00 for the second and six months' subscription to the California Cultivator for all photos retained for later use. All competing photographs become the property of the Cultivator unless they are returned within a few days after the first of the month.

SUGAR BEET SEED

It seems there is more sugar beet seed in California than appeared at first, though the supply will be exceedingly short. We have from J. A. Driffill, manager of the American Beet Sugar Company at Oxnard, a statement that his company has sufficient seed for next year's planting. In addition Mr. Driffill writes: "It is quite possible to raise beet seed in the United States, but at a very much higher cost than we have been paying for the imported seed from Germany."

From a circular sent out by sugar brokers in New York regarding the beet seed situation we quote: "Beet seed is still not available from Europe, except in most moderate quantities and at frightfully high prices. In Eastern Germany, Western Russia and Northern Austria the same condition prevails and will extend continually. The present growing beet crop and general harvests of Europe are already terribly affected. It might be well to look ahead for the effect of this war on the following crop."

The factories in California have a partial supply, but are guessing as to securing seed on contracts made months ago. It is hoped, however, that by November 1 the situation will clear up and that European seed may be received. While it is presumable that the beets may not be harvested for sugar, it is likely that the women and children will be able to harvest the seeds. In the meantime such seed as is available is offered at prices ranging from $16 to $40 per sack, plus transportation expenses.

A report to the United States department of agriculture, written by the Allen G. Freeman Company of San Francisco, representatives of a German firm of sugar beet seed growers, states that the harvesting of the seed in Germany is regularly done by women brought in the spring from Russia and German Poland, these women returning to their homes in the fall when the harvest is over. Therefore they are now on hand for the harvest work. This report further states:

"There is a very considerable percentage of last year's crop of sugar beet seed now in the hands of the German growers, last year's crop having been an abnormal one in quantity and above the wants of the beet growing world, which, added to the natural supply of this year, will be ample for the world's use. It only remains, as far as the wants in this country are concerned, for some means to be found to get this seed to a port where it can be loaded on neutral ships and brought to this country, and having no food value for man or beast, there should be no objection to its being shipped to this country especially.

"The beet sugar factories in this country have a quantity of sugar beet seed now on hand equal to one-fifth of the normal use in one season, but it is, of course, very unequally distributed, some having enough for their normal use and others none at all."

C. A. Johnson, manager of the Holly Sugar Company at Huntington Beach, writes:

"The sugar beet seed situation is still a very uncertain one. The price of seed which is so located that the buyer can be sure of getting delivery is exceedingly high, say $55.00 to $60.00 per bag, and right now I do not know where it would be possible to get any seed even at that price.

"At the outset of the trouble in Europe we had the feeling that the war would not last a great while, and that it would be possible later on to get the beet seed the same as in other years. Nevertheless as a matter of insurance we purchased seed at the high prices attained and have sufficient on hand in our own warehouse to plant our usual amount of acreage for this factory, although it goes without saying that seed will be much more economically used for next year's crop than has been customary. It is possible to do this and still get a good stand of beets by using extra care in preparing the seed bed and doing the planting during the right time, etc. It may be necessary to cut out some ground on which it has always been difficult to get a stand and which, therefore does not normally yield a fair crop.

"The sugar factories have succeeded in enlisting the assistance of the United States department of commerce, and as there are quite large quantities of seed in warehouses in Europe, we believe a way will be found of getting it to a neutral port, in which case we believe there will be ample seed for the entire country, having in mind that in all probability not all of the mills in United States will operate next year. Of course, if this seed is now available it will not help the factories that have paid the high prices, except to make the quantity for planting more plentiful.

"We believe the situation in California to be as good as it is in any other part of the country in this respect."

From Pres. A. R. Peck, of the Anaheim Sugar Company, we have the following word:

"The department of commerce in Washington is at present undertaking ot cooperate with the beet sugar manufacturers of the United States to arrange for transportation of beet seed from points in Germany to Amsterdam or other neutral points in Holland, with the hope of being able to supply all the beet seed required in the United States next year, and there is considerable prospect of this being successful.

"We have only recently received 300 bags of seed in New York shipped from Holland, and if transportation facilities can be arranged on the other side as stated there will be no doubt but that delivery can be made in time for February planting."

Agricultural News Notes

The orange crop of Palestine is largely shipped out in the months of February and March, going to England, the continent of Europe, America and even Australia.

Heavy demand for horses and mules suitable for army purposes for nations engaged in the European war has caused prices to advance sharply at the Chicago stock yards.

The German government, so it is reported, has put in a cotton press at Tsingtau and intends to charge 10 cents (gold) a bale for pressing, as against the present price of five times this amount, so as to encourage cotton growing in Shantung province, China.

The Canadian Pacific has made a special rate of one cent a mile for farm laborers destined for the Saskatchewan farms to take care of this year's large harvest. It is also announced that those unable to pay will be transported by the railway company free.

Under the Forest Homestead Act, which was passed in June of 1906, 57,762 acres of land in the national forests of California were listed to applicants during the fiscal year ending June 30, 1914. There were 510 applications made under the Forest Homestead Act.

Recently experiments have been made looking to the use of the Chinese dried persimmon for manufacture into jelly. It is stated that the experiments have been successful and that Tsinanfu, the center of a large persimmon-producing area, is shipping dried persimmons abroad for this purpose.

Cattle must have health certificates showing that they have passed the tuberculin test before they can be admitted to Illinois for breeding or dairy use. This prohibition was embodied in a proclamation recently issued by Governor Dunne. Preparations are being made, it is stated, to test in the courts the legality of the governor's order.

Agriculturally last year Italy was prosperous, for the crops generally were abundant, although some regions suffered because of unusual weather conditions. This was especially so in Sardinia and Sicily, where almonds and olives suffered from drouth and cold. Then there was a short silk crop, and this assisted materially in the general unrest of business.

Agricultural News Notes of the Pacific Coast

Northern California

The hop festival at Ukiah will be held September 15-20.

The Yuba City packing house is running full handed on dried fruits.

Some days shipments of grapes from California are in excess of 100 cars.

Delevan, Colusa County, is importing a large number of pure breed Holsteins.

Officers from the war department have been buying army mules in Glenn County.

Much interest was taken in the dairy contest at the rice exposition at Gridley last week.

Highway work in Yolo County will be pushed to the utmost during the coming few months.

Mendocino County owners of timber lands have organized a forest protective association.

Improved irrigation facilities of Shasta County are giving an impetus to the dairy industry.

The first silo in the dairy section about Anderson, Shasta County, is just being constructed.

It is rumored that the big sugar factory at Hamilton, Glenn County, will operate next year.

Horticultural Commissioner Hecke of Yolo County is making careful experiments in the pruning of apricots.

Every foot of available space was taken at the Humboldt County fair which was held at Ferndale last week.

The county adviser of Napa County reports serious attacks of wooly aphis in the apple and pear orchards.

The cured fruit association of Chico, Butte County, has begun the shipment of this season's dried fruit.

The Central California cannery at Yuba City recently broke its record by totaling 2050 cases in one day's run.

Nevada County's shipment of Bartlett pears this season is declared to be the finest in quality ever sent out of the county.

The exposition management reports work on the grounds more active than ever and that there will be no serious result from the European war.

The sanitary engineer of the California Immigration and Housing Commission reports camp conditions in the Wheatland hop district as entirely sanitary.

Boys' agricultural clubs of Grass Valley and Nevada City, Nevada County, are talking of awarding to one boy in each club a trip to Washington, D. C.

The California Almond Growers Exchange has named the following prices: Nonpariels, 20; I. X. L., 19; N. P. U., 18; Drakes, 15; these f. o. b. trade prices.

The exhibit palaces at the Panama-Pacific International Exposition at San Francisco in 1915 will be open by day, closing at sundown, but the concessions district, the great "zone" will remain open until eleven o'clock at night. Admission to the exposition grounds for adults will be 50 cents, while for children under twelve it will be 25 cents.

Central California

Lindsay, Tulare County, is to have a new canning plant.

The cannery at Tulare is running full handed on tomatoes.

Organization of a farm bureau is progressing in Kern County.

The Kerman alfalfa mill is ready to start on its season's work.

The green fruit packing houses are practically all working now on dried fruit.

It is claimed the war will advance the price of California olives $40 to $60 per ton.

Moving pictures have been taken of the cattle feeding operations of Tulare County.

Rice growing is proving a success in Kern County, where it has been tried out on alkali lands.

The packing house at Dinuba has been opened after several weeks and will run on Emperors until the season closes.

October 7th has been selected as Watsonville day at the California Apple Show, to be held in San Francisco.

The work of fumigation against the grey scale in Tulare County citrus orchards is reported as thoroughly satisfactory.

The California Apple Show management has issued its premium list. Prize money this year amounts to more than $3500.

Modesto, Stanislaus County, will be the scene of the California dairy fair, which will open October 14, and continue four days. There will be stock judging and butter scoring contests.

The Associated Raisin Company has just issued a notice to packers that orders have been received for more seedless raisins than will be produced. The association is compelled to pro rate among packers the available crop.

Members of the Dinuba Cured Fruit Exchange are well satisfied with their first season's activities. Most of the fruit handled has been figs and peaches. Members have decided to hold the fruit until the market is stronger.

Grain farmers in the Ducor district of Tulare County are holding their grain for the rise in prices expected because of war conditions. It is estimated that there are in this district 30,000 bags of wheat still undelivered to warehouses.

The Tulare County highway commission is discussing with taxpayers the advisability of a large issue of road bonds, the proceeds from the sale of which are to be used in constructing bridges along the line of the state highway and roads connecting with the state system.

Stockmen of Kern, Kings, Fresno, Santa Barbara, San Luis Obispo and Southern Monterey Counties met in Paso Robles on the last Saturday in August and organized a stockmen's association for Central California. Howard V. Jack was elected president; Fred Bixby, T. W. Dibblee, Frank Munser and J. E. Redman, vice-presidents; Eaton Mills, treasurer, and Ernest Vollmer, Paso Robles, secretary.

Southern California

Redlands orange growers are spraying for red spider.

The Orange County blackeye bean crop is being harvested.

Walnut growers of Whittier report crop above the average.

A lemon marketing association has been formed at Yorba Linda, Orange County.

The first shipment of walnuts from Fullerton, Orange County, will be made about September 15.

Orange County will harvest about 16,000 tons of chili peppers, worth a quarter of a million dollars.

The new cannery of the Orange County Vegetable Association has been opened at Villa Park.

The walnut harvest over the southern part of the state is at least two weeks ahead of the average season.

The Cured Fruit Association at Santa Paula has just shipped two carloads of dried apricots to Rotterdam.

The national banks of Imperial Valley will advance $360,000 to cotton growers to aid them in picking their crop.

Threshing outfits are at work on the big San Joaquin ranch in Orange County, cleaning up about 1000 acres of beans a day.

San Diego merchants are interested in a movement to develop the trade of the Imperial Valley, carrying merchandise by auto truck.

Redlands orange growers are estimating the coming crop of navels and the general opinion is that there will be a big crop of good quality.

The Arboricultural Association of Southern California met at the Glenwood, Riverside, September 10-11. The president of the association is J. M. Paige.

The LaVerne Orange Growers' Association has decided to erect a $50,000 precooling and ice plant with capacity of 500 cars. The association has also decided to handle lemons at its packing house.

Shipments of tomatoes began going out of Fullerton, Orange County, the middle of the month. The acreage about Fullerton is estimated at about 550. Nearly all the crop goes to eastern markets.

Horticultural Commissioner Beers of Santa Barbara County states in his August report that the walnuts are unusually fine in size and quality this season, and that the tonnage will be practically normal.

Cotton growers of the Imperial Valley are receiving relief through a large fund which has been placed at their disposal. An advance of $20 will be made on each bale of cotton, warehouse receipts being the security.

Farm Adviser Wm. B. Parker of Ventura County has announced dates of meetings at the various advisory centers as follows: Fillmore, the first Monday evening of each month; Oxnard, the second Wednesday evening; Camarillo, the second Friday evening; Santa Paula, the last Tuesday evening; Simi, the fourth Wednesday evening; Mound, placed provisionally on the second Monday evening.

The Coast

Arizona state fair was held at Phoenix, November 9-14.

Brigham City, Utah, observed Peach Day, September 9.

The agricultural fair at Willcox, Arizona, will be held October 29-31.

North Yakima, Washington, recently shipped over $300,000 worth of sheep to Chicago.

Recent heavy rains are filling the Roosevelt reservoir of the Salt River Valley, Arizona.

Acreage of cotton in Arizona has increased from 4000 acres last year to 18,000 this year.

Twenty miles of pipe have been laid to conduct irrigation water to tracts near Spokane, Washington.

Grain producers of Long Valley, Idaho, are harvesting the biggest crop of wheat ever grown in that section.

Live stock breeders of Enterprise, Oregon, are shipping more live stock than during the same period for years.

Cotton growers near Chandler, Arizona, have arranged with 100 Indian cotton pickers to handle the local crop.

Sugar factories at Odgen, Utah, opened on September 7; others in the same state will be opening as late as the end of the month.

A meeting of Maricopa County, Arizona, farmers was held in Phoenix last week to discuss matters of better irrigation facilities.

The North Pacific Fruit Distributors recently held its directors meeting and discussed market conditions caused by the European war.

An important meeting of lettuce growers was held at Phoenix recently and the matter of affiliation with the Farmers Union discussed.

Arizona entomologists are urging a greater number of turkeys to control the grasshopper pest, claiming this means far preferable to the poisoned bait.

Truck gardeners at Chandler, Arizona, are uniting in the production of lettuce. Effort will be made to ship winter production in large quantities to eastern markets.

Smut explosions and the burning of threshing machines and grain have occurred in the county of Whitman, Washington, so as to cause the enormous loss of $2,000,000.

Arizona has a law which compels every stock owner to provide drinking places for cattle in pasture, or at least prevent animals from suffering from lack of water or shade.

The fair which was to have been held at Victoria, British Columbia, has been called off on account of the European war, and race horses and other features have been diverted to other Northwestern fairs.

Within the past two months 19 new fruit growers associations have united with the Northwest Fruit Distributors. This means an increase of membership to the extent of 3000.

Milton, Oregon, estimates its shipments of fruits as sufficient to make a stack of fruit one mile long, 12 feet high and eight feet wide, and that it will aggregate 3,000,000 pounds.

RAISING HOGS ON ALFALFA

Written for the California Cultivator

By Leroy Anderson

A Ventura County subscriber asks if raising hogs on alfalfa is generally considered successful; also what gain should be made by a young pig running on alfalfa, and where to obtain young pigs for feeding.

Alfalfa alone is not found to be a successful ration for hogs. It affords the best pasture known, but to make the most and cheapest pork some grain should be fed with it. Authorities in hog lore say that alfalfa is a maintenance ration, i. e., a mature hog will keep alive and possibly keep its weight by feeding on alfalfa alone, but something else must be fed if the hog is expected to grow. In this present day it is found that the most rapid growth of food animals is the cheapest—the sooner a pig can be grown to market size and conditions the most profit usually.

A pig at eight months should weigh from 200 to 250 pounds, but this can be obtained only by liberal feeding. Henry in his "Feeds and Feeding" reports an experiment in point at the Nebraska station with feeding corn to pigs on alfalfa pasture.

"Snyder of the Nebraska station grazed three lots of 47-pound pigs on alfalfa pasture during each of two summers. One lot received a light, the second a medium and the third a full allowance of shelled corn. The combined results of the trials, lasting 98 and 119 days respectively, are averaged below.

"Light, medium and heavy feeding of corn to pigs on alfalfa pasture:

Daily allowance of corn	Average daily gain lbs.	Corn for 100 lbs. gain lbs.
Lot I. Shelled corn, 0.5 lb...	0.4	128
Lot II. Shelled corn, 1.1 lbs.	0.5	221
Lot III. Shelled corn, 2.6 lbs.	0.8	331

"It is shown that Lot 1, fed a light grain allowance on alfalfa pasture, required only 39 per cent as much grain for 100 pounds gain as Lot III, fed a full corn allowance. Lot III however, made twice as rapid gains, as Lot I. Snyder concludes that a light grain allowance on alfalfa pasture is not economical for growing pigs unless alfalfa is abundant, grain high in price and market conditions warrant holding the pigs. It is usually more profitable to feed two pounds or more of corn per 100 pounds of pigs than to feed a lighter ration. Cottrell of the Colorado station states that alfalfa makes the best hog pasture and that hogs fed grain daily will make from 500 to 1000 pounds of gain during the pasture season from an acre of good alfalfa, after deducting the gain which the grain would make if fed alone."

Barley has about the same feeding value as corn and is the universal grain for hogs in California. A 100-pound pig could be fed profitably two pounds of barley a day in addition to alfalfa pasture with the present price of barley and the present market for pork. As the pig grows the grain rations may be increased in proportion. Some feeders arrange a large hopper which is filled with rolled barley and which feeds it down as the pigs eat out at the bottom. The pigs then have the grain constantly before them and a saving of labor is made in feeding. One Sacramento Valley farmer who fed this way, with his hogs running on alfalfa pasture, told me he received $3.50 per 100 for his barley through making it into pork. Kafir and Egyptian corn have about the same fattening value as barley or maize.

Young pigs or feeders are not usually found in the city markets. They may be purchased in localities where many pigs are raised. I would suggest writing to the Ventura County farm adviser, Wm. B. Parker, at Ventura. He may know of some for sale. Also Roland R. Mack, Bakersfield, farm adviser for Kern County, also the California Polytechnic School at San Luis Obispo. Their animal husbandry instructor, Mr. C. W. Rubel, may know of some.

INCREASING MEAT PRODUCTION

Written for California Cultivator

By Sacramento Valley Contributor

The greatest business in the world today is the production of food for the human race.

Population is increasing much more rapidly than the supplies of meat, grains and vegetables. As long as there have been rich lands unoccupied, an increase in the production of food stuffs has required simply the opening up and cultivation of virgin prairie lands, either in America or elsewhere. Now, in order to provide more food for the steadily increasing population of the globe, the efficiency of the elements of food production must be increased. More and better crops must be grown on every acre of land, and we must have types of animals that will make more meat for the food consumed.

Any one who can develop a grain that will increase production by 100 pounds per acre is a benefactor to the human race, and the same is true of the one who develops a type of meat-making animal that produces more good meat from the same food and in a shorter time than now required by types in use or available.

We have had several classes of breeders of live stock since the improvement of domestic animals and the formation of breeds began.

To one class belong those who attempt faithfully to breed animals true to the accepted type—content to let well enough alone, but honorable in that they discard misfits and culls, and by careful selection maintain or increase the standard of their productions.

Those of another class pay little attention to anything but pedigree and color, and are in the business for revenue only.

In another class belong the great constructive and creative breeders of plants and animals. There are not many of them in the world, but it is to them that we must look for help in solving the world's food problem.

The creative breeder must have an ideal and if his work is to be of great value to mankind, this ideal must be of greater utility than anything now in existence. Amos Cruickshank had in his mind a blockier, more evenly covered, better meat making Shorthorn, than was then being bred or he could never have developed Cruick-

"Waste not want not"

This motto is of vital importance to every cream producer.

If you are selling cream or making butter and have no separator, or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

It is easy to find out how much you are losing in either case; just ask the local De Laval agent to set up a machine for you on your place and see for yourself how much more cream you will get with a De Laval.

With present prices for cream it is too valuable to waste.

Save ALL your cream with a

DE LAVAL

You can't afford to wait until next spring. Let the De Laval start saving cream for you right now and it will earn its cost by spring.

See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

Purebred Registered
HOLSTEIN CATTLE

Six years' study of dairy operations on over twenty farms in three different parts of Minnesota, showed Prof. Cooper of the state experiment station that dairying is most profitable in the "Holstein section" of the state.

In 1905, the average profit per cow was $10.10. In 1909, it was $38.45 per cow. Increase was due to improved herds, purebred registered Holsteins having been substituted for grades.

When dairying is put on a systematic basis, the Holstein cow comes to the front. For facts and figures

shank Shorthorns. The great improvers of the breeds of sheep worked for years toward an ideal before it was produced, before an animal was developed that carried a larger quantity of high class meat over shoulders, back, loin, rump and thigh. The improved breeds and types of hogs are far more efficient pork making machines than were their raw boned, long legged predecessors.

It is important that this improvement be carried on with every animal or bird that is capable of increasing the world's food supply, for the time is rapidly approaching when food must be produced in larger quantities not only by farmers but by city dwellers as well.

In densely populated China, every available area is used for growing vegetables, poultry or stock. In this country thousands of chickens and pigeons could be grown in limited quarters but where they can be given the care and attention they require. Farmers who handle large acreages often cannot produce poultry in large numbers because their time is too fully occupied with field work and the care of other live stock.

In Marin County, at Sleepy Hollow Ranch, R. M. Hotaling is demonstrating what can be done in the way if improving the meat making ability of pigeons. By judicious crossing, he has in four years produced a bird that for neatness, compactness and all round usefulness, is far superior to any of the parent stock from which the ideal he has in mind has been produced. It will probably require many more generations of birds to fix the type, but when it is accomplished a great good will be done for mankind.

The world needs more great breeders, and every encouragement should be given those who have ideals, and with them the determination to work them out to a successful conclusion.

PROTECTION OF WOUNDS

When an animal is wounded it is important to treat the wound in such a way as not to prevent its healing and yet to prevent screw worms and house flies from attacking the open surfaces, laying eggs, or carrying infection to the animal.

The screw worm particularly deposits eggs in wounds, and there are other flies that may deposit their eggs in this way. The larvae, or maggots hatching from these eggs, infest the wound and burrow more or less extensively in the surrounding tissues, so that serious damage may result.

The housefly alights on wounds to suck up the exudate, and is a cause of considerable annoyance to animals. It prevents wounds from healing and may introduce agents of infection which adhere to its body.

The department of agriculture, in a bulletin on repellents for protecting animals from the attacks of flies, quotes the following formulas for application to wounds:

Jensen gives three formulas of repellents for application to wounds:

Formula No. 1: Oil of tar, eight ounces; cottonseed oil to make 32 ounces.

Formula No. 2: Powdered naphthalin, two ounces; hydrous wool fat, 14 ounces. Mix into an ointment.

Formula No. 3: Coal tar, 12 ounces; carbon disulphid, four ounces. Mix; keep in a well-stoppered bottle and apply with a brush.

Mixtures Nos. 2 and 3 are said to adhere to moist surfaces, and No. 3 is said, in addition, to form a coating over raw surfaces and protect from the screw-worm fly.

The editor at the close of the article in which the above are given adds the following formula: Oil of turpentine, one dram; phenol, one dram; cottonseed oil to make four ounces. Mix and apply freely to wounds.

It is stated that this remedy is highly effective and is used widely in the South. It is said to induce healthy granulation of wounds.

HOW TO LOSE MONEY IN DAIRYING

By following these rules any dairy farmer can insure the failure of his business, says Professor G. W. Barnes, farm advisor on livestock of the University of Arizona agricultural extension service:

1. Use scrub bulls. This will run down any herd in quick time.

2. Let the bull run with the cows. This will make their milk yield fall off and their calves come when least desired.

3. Do not test the cows for milk production or butter-fat. In this way the poor cows will lose enough money in a year to buy several good ones.

4. Keep only the heavy eating cows which produce little milk.

5. Raise only the heifers from nonproducing cows.

6. Feed sour and rotten feeds.

7. Do not supply pure water, but make the cows drink out of mud holes.

8. Furnish no shade during the summer months.

9. Have no shelter for the cows in cold and inclement weather. This will reduce the milk flow from 35 to 50 per cent.

10. Milk at irregular intervals.

11. Hire rough milkers who do not milk thoroughly.

12. Get in the cows with the assistance of dogs.

13. Feed only enough to keep the cows alive. This will surely stop the milk flow.

14. Never pay any attention to udder troubles. Beautiful cases of garget may thus be developed.

15. Buy cheap dairy cows anywhere. In this way one may succeed in introducing contagious abortion into the herd and community.

16. Keep the dairy buildings and utensils as dirty as possible. A very inferior quality of milk may thus be produced.

LIVE STOCK AT WHITTIER SCHOOL

In a recent item regarding the dairy barn at the Whittier school we were unable to give information regarding some of the dairy animals which were there in charge of Mr. W. H. Taylor, superintendent of the farm. We had written Mr. Fred C. Melles for exact information which we had expected to use with the items and the photographs. These did not arrive until after the paper had gone to press, so we add these few statements from Mr. Melles' letter.

There are on the farm 30 acres in alfalfa and 20 acres in corn. The milking barn which we illustrated

SILOS

When writing advertisers, mention The Cultivator.

has a capacity of 48 cows, but there are now only 30 milking. The hog pens which were illustrated are 100 by 200 feet and the dipping tank is 6 by 12 by 6 feet. The barn was designed by the state engineering department of which W. F. McClure is director, and George A. Stewart was in charge of construction.

To give an idea of the character of the dairy, we mention the names of some of the animals which are now milking: Mutual Ormsby De Kol De Peiterje, Segis Beryl Hengervelds Favorite (a granddaughter of King Segis), May Rouble Hartog, Princess Clothilde Pieterje, De Kol Artis Pieterje Favorite Queen 2nd, De Kol Pontiac Korndyke (a daughter of Pontiac Aggie Korndyke). A number of granddaughters of King of the Pontiac and granddaughters of De Kol 2nd Mutual Paul.

The prize winner of the whole herd is Hartog Pontiac, a son of King Pontiac, and one of the finest Holsteins in the country, held at the present time at $50,000. In addition there are a couple of other fine animals at the farm, Rowena Maid Mutual and Sir Riverside Tommy.

LIVE STOCK AT THE FAIR

(Continued from Page 267)

the coast, were making remarks within the writer's hearing, of the highest praise for the work being done on the Pacific coast.

Let us note the character of sheds, pens and stables furnished to those who bring their stock to be shown. We find a quality of comfort as well as style of architecture nearly and many times superior in fitting to those of the eastern fairs, and the care taken by the grooms in attendance is that of pride, intelligence and deep interest in the future industry of the state. Incidentally it might be mentioned that there are many prizes being given solely for the benefit of the grooms. Let us note the intelligence manifested by the breeders in their fitting for the exhibit and we find in several instances a touch really superior to that in the eastern ring.

All breeders have a friendly spirit as well as friendly rivalry existing and joke and josh each other as of old. The prices that some of them are obtaining in their private sales are exceeding those obtained from the states of Illinois, Iowa and others of the middle west.

Now the writer will take you for a little ramble through the barns and stock pens.

First, let us enter the horse barns. Here we find a large exhibit of farm horses; the kind we are all striving for in service and price, numbering over 50 head. We find many colts, of splendid conformation, with their mothers, ofttimes nearly full-blooded animals, and we find the old farm plug kept up in good condition and brought here as an example to be noted. On the other hand, turning to the thoroughbred stallion department, we find the latest importation from France, numbering 10 head, and chased for three days by a German cruiser; the last to be exported. On the other side of the barn a splendid exhibit of Shires, numbering 12 head, which are some of the best on the Pacific coast. You will note that the Percherons are predominant; many of the best having been raised within the state. Wandering into another barn the trotters confront us, and the pride manifested by the owners in home-grown stock impressed the writer with the fact that California still maintains her reputation as a trotting state.

That barn in the far corner contains 32 head of the mule family and fine specimens they are, too.

Now let's hasten, for here are the cattle barns, and we must look over the beef and dairy breeds ere we pass on. The representation of the Shorthorns and Herefords is extensive, as well as of high quality in breeding. The writer might touch upon the above breeds to a greater extent, but he will save that for the following issue and give you an idea of what this state produces in dairy cattle, for truly it is coming to the front as a dairy state. Here we find the famous King of the Pontiacs, there a large representation of the De Kol family and many fine granddaughters of the Johanna blood; the dairy division, numbering the Jerseys, which are represented in some splendid quality animals, has a total of about 200 head. The contests are on and soon we will know the ones that stand at the top.

Now, across the grounds, and we will see the hogs. A finer bunch has never been exhibited in the history of the California state fairs. Four hundred and forty-one. Yes, and they are beauties, every one of them. The Berkshire breed, numbering among them famous animals from the Robin Hood and Masterpiece lines, and there are also several champion winners, while the Poland-Chinas show the best from the famous eastern herds. Duroc-Jerseys, Chester Whites and two Hampshires, numbering about 150 from the representative herds of the state, in fact, the hog men never have shown a greater interest in their favorite animals than is now being manifested on the fair grounds.

But did you want to see the sheep? Well, here are several pens from five representative ranchers and numbering 130. Yes, and there is a nice display of Angora goats, too, which, by the way, bid fair to build up one of the future industries of our state.

Now we have but slightly gone over the situation, but it is in such a manner that it will be hoped by the writer you will follow the winnings to be given in our next issue and increase your herds with some of the best.

Every Dairyman should have a Copy of this Valuable Book

Your name and address on a postal will bring you a copy

FREE

It gives facts of vital importance about feeding; also furnishes information about Dried Beet Pulp and how it should be fed.

LARROWE'S DRIED BEET PULP

is the ideal feed, not only for dairy cows, but also for hogs, goats, sheep, poultry and horses. It is wonderfully rich in carbohydrates. Makes a splendid combination with alfalfa. Can be added to any ration with profit. Succulent, digestible and palatable—Larrowe's Dried Beet Pulp entirely displaces silage (or can be fed with it, if desired) and is clean and healthful.

For FATTENING—and HORSES

We call your special attention to Larrowe's MOLASSES-DRIED Beet Pulp, which is simply the plain beet pulp with beet molasses dried. It is preferred by many feeders on account of its sweetness, and is being much used for dairy cattle as well as for fattening. It makes a splendid feed for horses—improving the general condition as well as coat.

Try a sack or two and note with what relish your stock take to it. Ask your dealer for "Larrowe's MOLASSES-DRIED Beet Pulp."

MORE MILK—QUICK

When you start feeding Larrowe's Dried Beet Pulp you get an instant response from your cows not only in improved health and general condition—but an extra 1 to 5 lbs. of milk per cow a day. This is surely worth trying. Order a sack from your feed dealer today and test it on one cow whose milk record you know.

In the meantime we'll be glad to send you a copy of our booklet—"Profitable Feeding"—free, if you write for it.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Chronic Rheumatism

I have a large horse eight years old that for three or four years has been gradually getting stiff in front. In taking a step after standing his joints make a cracking noise, particularly those of the shoulders. A year ago I consulted a veterinarian about him and he advised getting him shod with elevated heels, which gave some relief. Recently I took him to another veterinarian and he applied blisters to shoulders and ankles, which also gave some relief. The same veterinarian thought he was subject to rheumatism. He has a thick neck and is not proportionately wide across the shoulders, which necessitates the use of a sweeny collar. He is worked mostly in vineyard and orchard and very little on the road. In starting a heavy load after standing some time he humps his back as though in great pain. Do you think rest and running in pasture would cure him?—Subscriber, Parlier.

The symptoms you give would lead one to believe that the horse has chronic rheumatism. After allowing it to run so long it will probably take some time before marked relief would be shown from any treatment. Rest and pasture should benefit him very much. Get the following medicine for him: Salicylate of soda, four ounces; bicarbonate of soda, one pound. Mix and give a small tablespoon once a day. Also feed with his grain a teacup of ground flaxseed with the oil left in once a day.

Malignant Catarrh

I have a Holstein bull which is feverish at times. Appetite is fairly good, but he eats slowly and as though he did not care whether he ate at all or not. His head and nose are very hot. He holds his head as though it hurt him all the time, and when he lies down he holds it straight out. He seems to be stiff and very weak. When I lead him he will stumble and fall over a very small object. His eyes and nose run a great deal of the time and he seems to be losing flesh constantly. — Subscriber, San Diego.

The symptoms you give are those of malignant catarrh. It is an infectious disease and other cattle should be removed from the place, at least a short distance, and the place disinfected with lime. It is a disease that does not spread very rapidly, and the one case may be the only one on the place, but usually in a short time one or two more may take it. The reason he holds his head out and does not care to eat is that he has a very sore throat. A liniment made of equal parts of olive oil, turpentine and aqua ammonia, applied to the throat and neck once a day, would probably help to relieve the animal. For internal treatment give one dram of calomel once a day for a week. Also get the following and use it as a gargle for the throat morning and evening: Chlorate of potash, eight ounces; tincture of iron, six ounces, and water enough to make one quart. Put two ounces of this solution in a long-neck bottle and add a pint of water. Drench the bull with this, allowing him to swallow a little at a time so it will have a chance to wet the throat well. Sponge the nose and eyes with warm water that has a little borax in it and keep him in a shady place so the light will not hurt his eyes. If you have more than one animal affected like this you had better report it to the county or state veterinarian.

Profit in the Poultry Yard

MARKETING POULTRY PRODUCTS

By Jean A. Koethen.

(Concluded from last week.)

The package must be attractive and delivered in good order. The postoffice department requires that eggs be packed so that they will not break, and there are various kinds of cartons and containers for this purpose. The postoffice requires that this container be wrapped so that nothing can escape from the package, and that each egg be wrapped separately in cotton, excelsior or some such material.

The cost of container and wrapper for two dozen eggs is estimated at eight cents. The postage will be about nine cents. The cost, therefore, of wrapping and mailing two dozen eggs will be approximately seventeen cents. But the wrapping and container for four dozen eggs cost little more than for two, hence the economy of a large package.

The department of agriculture at Washington has been making careful investigation of the practicability of parcels post for the farmer, and has come to the conclusion that "it is of particular value to the man whose flock is too small or who lives too far from express service to permit him to ship his eggs in the regular commercial case which holds 30 dozen." In its experiments the department found that less than 3.6 per cent of the eggs were broken, and less than 2.3 per cent were absolutely wasted, for the rest, though broken, could be used.

Preparing Market Poultry.

The farmer and general poultryman will usually do better if they sell their surplus cockerels and old hens alive. The preparing of market poultry is a specialty in itself, and dressed poultry is so perishable that, except for private customers a market is hard to find.

Chickens that are to be dressed for market should be fed a fattening ration for a couple of weeks, then confined and kept without food for from 24 to 36 hours before killing. If they have water they do not need food, and they are more easily dressed without it.

What is called "dry picking" is considered the best method of preparing market poultry. Fowls for use at home may be decapitated and scalded in the time-honored way, but they do not present the neat appearance of a bird that has been "stuck" and dry picked. Bleeding is often imperfect, and this gives the fowl a blotchy appearance which does not attract customers.

To dry pick, first hang up the bird by its legs, then, according to directions of the department of agriculture, "grasp it by the bony part of the skull. Do not let the fingers touch the neck. Make a small cut with a small, sharp-pointed knife on the right side of the roof of the mouth, just where the bones of the skull end. Brain for dry-picking by thrusting the knife through the groove which runs along the middle line of the roof of the mouth until it touches the skull midway between the eyes. Use a knife which is not more than two inches long, one-fourth inch wide, with a thin, flat handle, a sharp point, and a straight cutting edge."

These directions sound rather brutal, and I have never had the nerve to try them, but I dare say the method is quite as humane as decapitation, and as long as the market requires that dressed fowls keep their heads, the poultryman who wishes to sell dressed fowls will have to comply with them.

POULTRY SHOW DATES

Riverside, Oct. 13-17, 1914, County Fair Poultry show, E. I. Hammond, secretary.

Anderson, Cal., Oct. 22-24, 1914, O. W. Dais, secretary.

Stockton, Cal., Oct. 28-31, 1914, W. H. Mackay, secretary.

Sacramento, Cal., Nov. 2-7, 1914, C. A. Wilkins, secretary, Sacramento, Cal.

Santa Cruz, Cal., Nov. 11-14, 1914 inclusive, E. J. Harran, secretary, Santa Cruz, Cal.

Petaluma, Cal., Nov. 11-16, 1914, Thomas McGuire, secretary.

San Mateo, Cal., Nov. 12-15, 1914, Fred West, show secretary, box 701, Burlingame.

Willows, Cal., Nov. 18-21, 1914, Otto F. Schuchard, secretary.

Oakland, Cal., Nov. 24-29, 1914, Chas. G. Hinds, secretary, 535 42nd street.

Pasadena, Cal., Dec. 1-5, 1914, M. D. Cartwright, secretary, Pasadena, Cal.

Modesto, Cal., Dec. 2-5, 1914, A. D. Roberts, secretary.

San Francisco, Cal., Dec. 8-13, 1914, inclusive, W. H. Ingram, secretary, Fruitvale, Cal.

Porterville, Cal., Dec. 15-17, 1914, A. D. Fawcett, secretary.

Phoenix, Ariz., Dec. 23-26, 1914, Arizona state show.

Newburg, Ore., Jan. 5-9, 1915, C. Duer, secretary.

Coeur d'Alene, Idaho, Jan. 6-9, 1915, O. A. Laaks, secretary.

Los Angeles, Cal., Jan. 6-12, 1915, Henry H. Mumford, secretary, Prospect avenue, South Pasadena, Cal.

Albany, Ore., Jan. 7-10, 1915, E. Schoel, secretary, Albany.

Tacoma, Wash., Dec. 29-Jan. 2, 1915, J. A. Caddey, secretary.

If properly "stuck," the bird will bleed freely. As soon as it begins to bleed, a blood can is hooked onto the fleshy part of the lower mandible, and the picking begins. Right now is the time when the feathers come out most easily, and they may be "wiped off" with the hand in the direction in which they grow with little effort. If they are pulled in the opposite direction, there is more danger of tearing the flesh, and the feathers do not come out so readily.

Fowls picked for sale in the open market are usually not drawn, but private customers expect to receive them, as a rule, ready for cooking. To draw, cut a circle about the vent, so that it comes away in one piece with the lower intestine. If the fowl is held in very hot water a few seconds after it is dressed it looks plumper and more appetizing.

Dressed chickens sent by parcels post should be neatly wrapped in clean white cheesecloth. A bit of parsley tucked inside the package adds to its attractiveness. In the sale of both eggs and poultry, appearance counts for more than is commonly supposed. Whoever doubts this should take a look at the poultry displayed for sale in the show case of any high class city market. Doesn't it look "good enough to eat," all white and plump and garnished with parsley? It is not enough that things should be good; they must look good. Plenty of people are willing to pay a little extra for things that look as good as they really are, and these are the customers the man who bids for private trade must find.

MORE MONEY FROM EGGS

By H. L. Kempster.

Bad eggs cause farmers a loss of millions of dollars annually. Government experts estimate that five per cent of the eggs marketed have developing chickens and that three per cent are "rots" due to the embryo decaying. All these losses could be avoided by keeping roosters out of the flocks, thus having only infertile eggs produced. If Missouri farmers would follow this plan, they could save one and three-fourths millions of dollars annually.

Infertile eggs produced by flocks in which there is no male bird are the only kind that can reach the consumer in good condition during the hot summer months. The only object in having the male bird in the flock is to get fertile eggs for hatching purposes. Now that the hatching season is over, the Missouri College of Agriculture urges all farmers to sell off all the roosters or shut them away from the hens.

Last year in July and August nearly one-half the eggs leaving the farms were unfit for food. The farmer, as a result, received a low price. Prevent that loss this year by getting rid of the rooster. Now is the time to act to prevent future losses.

Growth, development, increase in power must come from within. The man or woman, to achieve, must be born again. Accomplishment is the result, not of fitness, but of determination to be fit; not of preparedness, but of striving for preparation.

Every woman should be interested in the outside appearance of her home. Her great opportunity to cultivate a love for the beautiful should not be neglected.

The Fresh Air Brooder Stove

It exhausts warm **Fresh Air** from its **Base** to the chicks. If you use our stove you can't get away from proper **ventilation. Our 1915 Brooder Stove** is by far the best model we have ever produced. Let us send you our **New Catalogue.** It is full of splendid information and value to you with any **system.**

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Over Peach Orchard.

Please state in your paper the best method of changing a thrifty Muir peach orchard to clings or prunes. Trees are five and seven years old. Some advise cutting low, five or six inches from ground, while others advise cutting above forks, letting them sprout and bud in sprout.—Old Subscriber.

The difficulty of grafting over a peach orchard is such that in consideration of the peach being a short-lived tree we do not think we would attempt it. If the work is done by an expert it is barely possible to get grafted trees into bearing quicker than to reset with young trees, but there are so many chances, together with possibility of diseases, that we would prefer that they be reset.

Nightshade.

I send branch from weed growing about here. What is it?—Subscriber.

This is the ordinary nightshade, Solanum nigrum, which infests nearly all sections of the country. We say "infests," although it is practically the same as the wonderberry which was advertised the United States over a few years ago as one of the greatest of Burbank's creations. The plant has the reputation of being poisonous, but the berries are said to make remarkably fine pie when fully ripe. It is also called morelle or stubble berry.

Black Knot on Quince

Is there a spray or any treatment for black knot on quince or apple trees? Our neighbors say it is contagious and advise us to take them out and use wood for fuel.—Subscriber, Orange.

Bordeaux paste applied after the black knot has been chiseled away and clean healthy wood of the tree is exposed is effective. If the knot entirely surrounds the trunk it may not be possible to save the tree. See Prof. Fawcett's article in Cultivator of January 22, 1914, page 102.

Butter Making

I have a three-year-old Jersey heifer with her first calf. She gives about six quarts at a milking, but the cream won't make the butter it should. After I take the butter off the buttermilk is thick with what I thought was butter. After straining it I found it was more like a thick curd or false butter, as some call it. She is perfectly healthy, has a good appetite, takes plenty of salt. What can I do for her? Are apples good for a cow?—Subscriber, Los Gatos.

The milk of a Jersey cow tests on the average about five per cent fat. Twelve quarts per day of two milkings is equal to 24 pounds, or about 1.20 pounds of fat. This should make from one and a quarter to one and a half pounds of butter. Putting it in another way, nine quarts of milk, or 18 pounds, would be required to make a pound of butter. However, this cow's milk may not contain over four per cent of fat, in which case she would make but little more than one pound of butter per day, and it would require about 11 quarts of milk for a pound of butter.

What causes the buttermilk to have the appearance described is difficult to say. The cream may have become too sour, when the casein would be coagulated very much and become hard enough to be strained out like cottage cheese. However, an over souring of the cream should not reduce the quantity of butter or hinder the completeness of churning.

Again the trouble sounds like a difficulty often encountered in the fall of the year, owing to three causes: (1) the cow having been many months in milk; (2) the cow having nothing but dry feed; and (3) the temperature of the cream at churning too low. As to (1) the subscriber does not say how long the cow has been milked since her last calf. If five or six months, or more, the butter fat globules are getting smaller and harder and thus the cream is more difficult to churn than when the cow is fresh. As to (2) the cow at this season probably has no green feed. This fact also tends to a harder butter fat and consequent difficult churning. Both (1) and (2) are partly obviated by churning at a temperature five to ten degrees higher than normally. At this season of the year in Los Gatos, however, the temperature is probably warm enough so that the cream should churn easily. But the nights are cold and may be the cream is cooled too much by time of churning. With all three of the above factors present, butter comes slowly and much is left in the buttermilk.

Give the cow any green feed available. Apples are all right and may be fed as much as a half bushel a day. Also pumpkins, pie melons, squash, green corn stalks, potato peelings, anything "that makes a noise like green.' If no green thing is handy buy a sack of linseed oil meal and feed a pound a day.

Use a thermometer in ripening the cream. Keep the cream as cool as possible until about 24 hours before churning, then warm to 70 degrees and let it sour, stirring occasionally. A few hours before churning let it cool to 62 to 65 degrees. If the cream is sour when skimmed keep it as cold as possible until four or five hours before churning and then warm to 62 to 65 degrees.

These are only suggestions — guesses, as it were, for one cannot prescribe definitely without seeing all the conditions with his own eyes.—L. A.

Analysis of Soils

A subscriber wishes information regarding soil analysis. Would suggest that he write division of chemistry, College of Agriculture, Berkeley, and ask for blanks and method of procedure. The college and the experiment station staff, however, have not found it possible to continue free analysis of soils, and a fee is charged according to the completeness of the analysis desired.

Nematodes

Am sending black eye bean stalks taken from five-acre field. They are troubled with knotty roots and vines soon die. The trouble started some five years ago and has gradually spread. It has increased this year faster than ever. — Subscriber, Anaheim.

These roots were submitted to Prof. H. S. Fawcett and he writes: "These beans appear to be affected by root knot, due to the root knot nematode worm. This disease is usually much worse on the light soils, especially soils that tend to be sandy, than on heavy soils. If the disease is confined to certain patches, as your subscriber suggests, one might use the clean culture method for a couple of years on this particular spot. By clean culture is meant the keeping down of weeds as well as other plants on the particular area so as to starve out the worms. In case the owner wishes to use the land for some purpose, barley or some other grain crop might be planted, although in this case the worms would not be starved out quite so soon. In addition to the root knot a few wireworms were seen in the samples."

Walnut Tree Diseased

I send limb from walnut tree. After apparent vigorous growth the young branches shed leaves and then make a growth of fuzzy leaves, or sometimes one side of the branch will send out new healthy leaves. Have a good crop of nuts with few blighted ones. The entire top of the tree has been cut and grafted with wood from healthy trees. Will the disease appear again after the tree makes new growth?—Subscriber, Anaheim.

On this point Professor Fawcett writes: "In regard to the walnut twig, I am unable to tell definitely just what the trouble might be from the specimen. It might possibly be that the water table was too high and that the roots on the walnut trees were being killed off by being too wet."

Legal

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

MR. PAYNE RETIRES

We regret very much that Mr. E. L. Payne, who has answered questions in the legal department of the Cultivator for several years, finds that he is unable to continue the work because of ill health. Mr. Payne has built up a most excellent practice in the city of Los Angeles, and perhaps has given to it altogether too close attention. So now he will join more closely the great Cultivator family by becoming a sure-enough farmer himself. He has lands in Antelope Valley in Los Angeles County, part of which are seeded to alfalfa, and in a short time he will be raising hogs and hominy. We are glad to welcome him into the farming class.

The work of Mr. Payne in this department has been most excellent and has benefited many subscribers of the Cultivator. To continue his work we have secured the services of Mr. L. B. Stanton, an attorney who has had many years' practice and one who will endeavor to give to our subscribers the best possible advice along legal lines. We again ask all who have occasion to use this department to state the cases fully and clearly and in as few words as possible. This department cannot give personal advice. Where a subscriber wishes an answer by mail, that is a matter which must be taken up with Mr. Stanton, and a fee will be charged wherever advice is given either in the office or by return mail. We cannot name a definite fee, as is done in the veterinary department, because many questions which might be asked an attorney are of such character as to involve many dollars worth of time to answer, while others are comparatively simple.

* * *

Division of Community Property.

Husband and wife own land bought with community money. The deed to them reads: "an undivided one-half interest to each with the right of survivorship in the survivor." In case of divorce can the wife get any of the husband's one-half? There are no children.—Subscriber, Tulare County.

In case of divorce the power of the court over property of both husband and wife is extensive, the court being enabled to require resort even to the separate property of the husband if under the circumstances of the particular case it considers that such should be done; ordinarily, however, the husband will not be required to give more than one-half of the community property.

Support of Family.

If a man and wife separate and neither have sued for divorce, can the man go away and leave minor children with wife without supporting said children? In case of adultery on part of husband, can wife obtain a divorce and custody of children?

The facts stated in the above case would seem to justify a complaint being laid before the district attorney of your county, as the penal code provides facts such as above stated constitute felony, and upon conviction the husband may be sent either to states prison or required to work upon the county roads and highways for a period not to exceed two years, the county paying to the wife and children the sum of $1.50 per day for such work. In this case under the facts stated there would be little question but that the wife, should she bring action for divorce, could obtain custody of the children.

Disposal of Property.

A man has property when he marries. If there is a divorce or he dies, does wife receive any of the property? If any, what part?—Subscriber, Hanford.

In case of divorce the court has large discretion over the property of both husband and wife and for the support of the wife may require resort to the separate property of the husband. In the case of death of the husband he may dispose of his separate estate by will so that the wife may have none or may have any part which he may desire. In case he should die without a will and leave no issue, his separate estate would go one-half to the surviving wife and the other half to his father, mother, brothers or sisters.

Exchange Contract.

A traded a ranch to B for town property. B had built a shed on an alley adjoining the lots, the alley never having been opened; about two months after transfer of properties was made B removed this shed. Did he have a legal right to do so or is he liable for the value of the shed?—Subscriber, Empire.

It is difficult to state just what rights you would have without seeing the contract of exchange, but if there was no mention of the shed in the contract it would seem B is entitled to remove the same.

Damaged Trees.

Can we claim damages in case of burning of our orange trees on the outside row by the men working on the roads? They poured oil on the grass and set it on fire when there was a strong wind blowing. The grass could have burned without oil and at a time when there was no breeze. We are not allowed to plow along the street row or plant or take out trees on the street row without orders from authorities and it seems to us hard if we have to stand by and see our trees ruined, that we have spent money and energy on. The burning of the Bermuda grass did no good, for it is already out fresh and green.—Subscriber, Pomona.

It has been held many times by our supreme court that a county is not liable for the negligence of its officers or agents, although the men working upon the roads would themselves be liable. It is, however, suggested that you put in a claim to the board of supervisors of your county for the damages sustained, as they have power to do justice in such cases.

County Coroner.

The coroner of this county, when called to hold an inquest over the body of a person who has suddenly died, brings a doctor with him, who, I am informed, charges $75.00 for pronouncing the cause of death, whereas, if he should take a local physician it would only be $10.00 or $15.00 at the most. We would like to know if he holds the right to do this or is it just customary and are we compelled to pay?—Subscriber, Fallbrook.

The coroner of your county is paid a salary by the county for his services and is not entitled to compel you to pay any charge for such a case as you have stated.

Foreclosure.

How long a time is allowed after foreclosure to redeem property? And can one pay it up just the same after foreclosure proceedings, until the time expires? Does one have to pay interest just the same as before?—Subscriber, Fallbrook.

The mortgagor is allowed one year from date of the sale under foreclosure within which to redeem his property. Upon such redemption he is required to pay the amount for which the property was sold, together with interest at the rate of one per cent per month from the date of sale to the day of redemption, regardless of the interest provided for in the mortgage.

Community Property.

In case a man and wife own a home, the wife having two children by her first marriage and the husband, two children by his first marriage, if the man dies can any of the children (they being all of age) take their share before the wife dies? The deed is in the husband's name and he has a homestead filed on the home in his own name. What difference would that make, if any?—Subscriber, Ventura County.

Providing the property owned is community property, upon the death of the husband the wife is entitled to one-half of the community property and one-third of the remaining one-half, the other two-thirds being given share and share alike to the two children of the husband's first marriage. The children of the wife by her first marriage are not entitled to inherit anything. In case it is the separate property of the husband, the same rules apply, except that the wife is not entitled to her one-half of community property. In case of a homestead being filed upon the property, if it is the separate property of the husband, the court may set it apart for the wife and family for a limited period, the title to the property being vested in the heirs of the husband as above stated. If the property is the community property of the husband and wife, she is entitled to have it set apart to her in its entirety, children having no interest therein except as survivors of the wife.

Contract of Sale.

Will you look over the enclosed contract and tell me if I can hold the buyer for two hundred dollars besides the two hundred he forfeited as part-payment. The land was turned over to the buyer and he cut three crops of hay amounting to about the value of the two hundred he paid at the signing of the contract. What rights have I in the contract? He, I understand, is not going to pay balance and will throw the land back on me.—Subscriber, Greenfield.

Your contract has been acknowledged so as to entitle it to be recorded, and if recorded now or hereafter will constitute a cloud upon the title to your property. Under this contract after the 1st of November, 1914, you are entitled to bring action for the balance due upon the property, if he fails to pay said balance. The last clause of the contract is one attempting to provide for a penalty in case the contract is broken, and as equity abhors a forfeiture, the court would probably consider that the $200 therein provided for would refer to the $200 paid at the time of signing the contract, you not being able to show damages greater than the original $200. Your proper procedure would be to bring action upon the contract either for the balance due or to have the contract cancelled and have judgment that the property be returned to you, free and clear of the encumbrance of this contract, unless of course buyer gives you quitclaim deed for the same and you accept such deed.

Forming Irrigation District.

A owns 70 acres of land with a 200-inch well on same. The land in territory surrounding his is being formed into an irrigation district. Will A's land without his signature become part of such an irrigation district? Has the district when formed a right to his 200 inches of water? Can A, after the formation of such an irrigation district, sell the water or his well and divert the water to the outside of the district? If he is included in the district can he do so if he is left out of the irrigation district?—Subscriber, San Fernando.

Many of the questions which you have asked above would require a very extensive search to answer, which would hardly be proper for a medium of this character, but a brief outline of one of the modes of forming an irrigation district and the powers of such district will probably give the bulk of the information sought. A petition is presented to the board of supervisors of the county, which board causes notice of a hearing upon the petition to be posted throughout the proposed district. Any person interested, objecting to the formation of said district, to the extent of the proposed improvement, or to the inclusion of his property, may file a written protest setting forth such objection with the clerk of the board at or before the time set for the hearing of said petition. The board of supervisors thereupon passes upon said protest and has power to exclude property from the district and modify the boundaries or reject the whole proposition. If the protest be denied the board adopts an ordinance for the calling of a special election in the proposed district to decide upon the incurring of indebtedness to defray the expenses of the improvement. An irrigation district is what is known as a quasi corporation and has power to condemn property for its purposes. No man's property can be taken by the state or for any public purpose without due compensation having been first made to him therefore, and it would probably be true that the district as formed would have at least a right to condemn the water arising from the land of A, if it saw fit so to do.

3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

WEISSBAUM PIPE WORKS
169 Eleventh Street, San Francisco

Household Department

FALL

Oh, apple time and cider time,
  And time of pumpkin pies,
Of stubblefields and naked trees,
  Of clear and cloudless skies;
Of babies jacketed and warm
  With dancing curls and feet
And red, red cheeks and glinting eyes
  In every nook and street.

And harvest moon and mockbird songs,
  And fieldlark's roundelay;
And goldenrod and heather-bloom,
  And thistledown at play;
And amber-colored morns and eves,
  And hazy nights and still;
And the sad call at eventide
  Of lonesome whippoorwill.

Migrating birds have all gone south
  But still the copses ring,
And still the mocking birds sing loud
  The songs they used to sing;
And the late morning glories bloom,
  And roses everywhere
Their perfumes and their petals fling
  Like broidered scarfs and rare.

The hazy time, the lazy time,
  The coaxy time of year;
Of dusty ways and short'ning days
  And nights of autumn cheer;
Take down the fiddle and the bow
  And wake the old-time tune
To autumn's cheer and winter near,
  And the round harvest moon.

—The Houston Post.

A GIRL AGAIN

By Florence V. Mead

Little Mrs. Judson kissed and hugged each of her three children three times round, making nine tearful good-bys. She solemnly adjured her husband to write each day a detailed account of the family health and doings, and he promised acquiescence as cheerfully as if he had not made the same promise five times before.

The more familiar scenes once left behind, Mrs. Judson's mind leaped forward to the tenth reunion she was on her way to attend at her beloved alma mater. Some of the girls—for "girls" they would always be to her—she hadn't seen since graduation, and her lips curved with smiles in anticipation of the delightful time they were sure to have together.

"Marion Bixby!" exclaimed a voice, as she stepped into College Hall, and she felt herself clasped in the embraces of three of her classmates. One of them held her off at arm's length and looked at her with mock severity.

"Who would ever dream, Marion Bixby, to see you so youthful and fresh, that you are Mrs. Robert F. Judson, and have three kiddies at home! I refuse to believe it!"

"You needn't, Clara. I can hardly realize it myself, now that I am back in college," and little Mrs. Judson laughed happily.

But as they passed the alumnae postoffice, on their way to the registrar's desk, she looked involuntarily into one of its lettered pigeon-holes, and confided to Frances Hale Severance, "I should like to hear from Rob tonight, though, and learn if the children cried for me when Maggie put them to bed, and if Rob remembered Junior's teddy-bear."

The following morning she went over for her mail. There might be even three letters, for the twins had promised to write. She could picture their facial contortions, the little fingers gripping unwieldy pencils that traced strange characters which she alone could decipher. But to her amazement, the pigeon-hole in which she peered so eagerly was empty. She even thrust an incredulous hand into its yawning emptiness. However, she reflected consolingly, letters would undoubtedly arrive on the twelve-o'clock train.

She was promptly on hand for the next distribution of mail, missing thereby an important class-meeting, but again her pigeonhole yielded no spoils. The second day brought no better results, and when the third dawned and waned with no letter to its credit, little Mrs. Judson became emphatically nervous.

She composed a fifteen-word telegram.

"There," she said, "I shall send that 'collect,' and I imagine it will bring Robert to his senses. He has spoiled my reunion already by his thoughtlessness."

As she went out of the door, she met Clara Folsom coming in, her arms loaded with letters and newspapers.

"Here," exclaimed Clara, "here is your mail, Marion Bixby—four letters from your husband and two from the twins, judging from the chirography, not to mention numberless letters and papers from other sources!"

Mrs. Judson stared at her in stupefaction. "Where did you find them?" she gasped.

"Where any reasonable mortal would expect to find them!" retorted Clara, severely. "In the pigeonhole marked J. You have been looking all the time under B."

A smile of comprehension dawned in the eyes of Marian Bixby Judson. "I—I forgot I was married!" she murmured, sheepishly.

Then she tore up the telegram and sat down happily in the midst of her letters.—Youth's Companion.

PRIZES FOR OCTOBER CONTEST

The Hallowe'en entertainment has been suggested as the subject for our next prize contest. Articles will be published in the Cultivator of October 15 and should be in this office by Thursday, October 8.

Two Dollars.

Two dollars in cash will be given for best short article describing a child's Hallowe'en party, a dinner, ride or any other form of Hallowe'en entertainment, giving of course that most interesting part of any party, "the eats."

One Dollar.

Read " A Good Way to Use Walnuts" in this department. Then send your favorite recipe using walnuts. For the best will be given one dollar in cash.

Cultivator for Six Months.

To all, not prize winners, whose articles or recipes are published, will be given six months' subscription to the California Cultivator. Remember all suggestions should be mailed to California Cultivator, Los Angeles, by October 8.

Send Suggestions.

Both subjects for the October contest were suggested by subscribers. Now what shall we have in November? With your article or recipe send in your suggestion.

Photo Contest Next.

On October 1st the prize winners in the photograph contest will be printed. Be sure to read "Prize Photos" on editorial page of this issue. Did you see the photos in the Cultivator of September 3? We want yours for the October number.

Conveniences for the Auto

MAKING A PULLMAN

First Prize Suggestion

By D. F. J. Bold, Whittier

The following represents the practical working out of several experiments at making a "Pullman" out of a Ford touring car.

The plan in general utilizes both seat cushions, supporting them on a frame work flush with the backs of both front and rear seats. This provides a continuous and very satisfactory spring bed as far as it goes, but it is only five feet long. Extra length is gained by utilizing a piece of canvas fastened at the back of the front seat and carried forward for about two feet. This piece is stiffened by two light transverse strips of board sewed into the canvas. Through the ends of these boards pass guys for lashing the canvas to the front bows of the auto top. With such a bed, a few blankets, with the curtains drawn down, camping out in rain or cold is real fun.

The frame work for supporting the cushions consists of uprights:

A. Two pieces 1x3x14½ inches.

B. Two pieces 1x3x24 inches. All four of these provided with a 1x3 inch slot in one end to accommodate the "rafters."

C. Two pieces 1x3x37 inches. (The rafters.)

D. Two quarter-inch boards, 10x36 inches.

Uprights A stand on wooden frame work of rear seat and rest against back cushions.

Uprights B stand on floor of car and rest against metal back of front seat behind robe rail.

Rafters C run from A to B.

Roof boards D lie across rafters.

The piece of canvas is anchored to front seat thus: A hem one and one-half inches wide is made across the end and through this hem is passed one inch strip of board a yard long, after fashion of strip at bottom of window curtain. This edge of the canvas is passed over the top of the front seat and the hemmed edge (enclosing board strip) is caught under the projecting metal ledge of the seat. When the two cushions are placed on supports the canvas is caught securely and evenly. Nothing now remains but to tighten up the guy ropes that suspend the canvas from the top bows. A few blankets and lo! the berth is made up.

When on the road the roof boards D are carried under the seat cushions. The uprights and rafters are wrapped in the canvas, making a neat package that can be stowed away in tonneau. The package weighs about six pounds.

A CHAIR FOR BABY

Second Prize Suggestion.

By Mrs. George H. Pettengill, Los Angeles.

I fear my auto suggestion will sound like a "paid advertisement" but think the end justifies the means, and what mother will not agree with me who has to hold the baby on her lap whenever she rides?

The suggestion is to buy a folding high chair.

Two rubber covered hooks clip over the top of the auto door, which cannot swing open while the seat is in place; from these hooks is suspended a small canvas covered seat capable of sustaining 100 pounds. The baby is strapped in, well bundled up and enjoys the ride as much as anyone. So does the mother!

The seat may be folded together in almost as small a parcel as a newspaper, and is indespensable when you are dining out, as it fastens over the back of any chair, thus making a high chair for baby.

If you tell the manufacturers you wish to use it in the auto, and tell them the make of your machine they will send the extra auto hooks gratis.

AUTO POCKETS FOR A TRIP

By Mrs. C. G. Ramsey, Orange.

Friends of mine were going east in their auto. I asked where they would put clothes enough to do the three children; the mother was sure she didn't know. I told her I'd fit the car out with a lot of handy pockets if she would get two yards of black oil cloth and some black-headed tacks. I cut two strips about 16 inches long from across one end, hemmed one long edge and turned it up to within three inches of the other edge, sewed it at each end, also three times at equal distance, making four pockets, notched the upper edge and worked buttonholes, using a shoe button to fasten each pocket, sewed black tape at upper corners and between, and tied one to each side of car where curtains roll up. Made two smaller ones for each side of the back window, one for the gowns, and the other for comb, brush, large hand glass, and powder can. Tied these so they could be taken down each night and hung in their tent. Also cut a pocket to fit each door and tacked them on. They were delighted with so much extra room—said I "ought to get a patent on my invention."

FOR A QUICK LUNCH

By Mrs. Robert Porter, Roseville.

We keep a little tin box under the rear seat. It is just large enough to hold six small sized paper plates, six napkins, and usually we have in it a box of nabiscos or zuzus or something similar. When we come home the box is refilled from the house supply and returned to its place. A tin tobacco box full of sandwiches and the thermos bottle with hot coffee can be added at very short notice, and ice cream bought on the way.

A GOOD WAY TO USE WALNUTS

A Whittier subscriber tells us how to utilize walnut meats discolored by last September's day of scorching heat. These meats though sound and sweet have been difficult to market on account of their appearance. They can be purchased as cracked meats at a price which makes them very attractive to the economical housekeeper who also sees in them possibilities of concocting new "meat" loaves, salads, etc.

Walnut Loaf.

Grind nuts through food chopper three times to make a walnut meal. Mix one third part of this walnut meal with two-thirds parts of Hamburg steak, also ground. Form into loaf and bake.

Probably most cooks would prefer to modify this meat and nut mixture by adding bread crumbs, cracker crumbs, corn meal, etc., perhaps with addition of egg, as it is rather rich for the ordinary digestion. But the suggestion is a valuable one and may lead to other culinary discoveries.

HAY

Under date of September 12 Scott, Magner & Miller say:

Receipts for the past week were 3932 tons. This is quite a falling off from the previous week of 5060 tons. At the same time the market has been so heavily stocked that even with the decrease of receipts it has been extremely difficult to move the hay and many cars have had to be left on demurrage.

Fancy hay sells readily and all other grades are dull and inactive. Alfalfa demand is light with receipts growing heavier.

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	8.00@9.00
No. 2 Wheat or Wheat and Oat	6.00@7.50
Choice Tame Oat	10.00@11.00
Other Tame Oat	7.00@9.00
Barley	6.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, new	30@45

GRAIN

Wheat, Cal. Club	1.75@1.77½
Corn, Eastern Yellow, blk.	1.92½@1.93¾

Oilcake Meal	32.00@33.50
Cocoanut Oilcake Meal	25.00@26.00

Citrus Fruit Market

Los Angeles, Sept. 16, 1914.

The orange market is a little better this week, somewhat improved all along the line. The great surplus of deciduous fruit is past its high water mark, and oranges are receiving a little more attention. Prices show some improvement, being at the present time about 15 cents per box higher than last week. No extremely high prices in prospect, but the orange condition is considered very satisfactory considering the quantity to go forward. After this week there will be about 2300 cars to go.

The lemon market is dead. There is practically no demand. Weather in the East has been around 60 degrees for the past month and people are not using many lemons. The exorbitantly high prices which prevailed at the outbreak of the European war have also helped in keeping the market down. Foreigns have been coming in great quantities and have sold at ruinously low prices. Last week in New Orleans 21,000 boxes of foreigns sold at an average per box of $1.40, delivered. In New York, 13,000 boxes of foreigns sold at $1.95. In Philadelphia, 11,000 boxes sold at an average price of $1.75 per box.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1913, 36,225 cars; lemons, 13,032; total, 49,257; to same date last season, oranges, 13,032; lemons, 2,105; total, 15,137; total of all citrus fruits two years ago this date, 34,089.

NEW YORK, Monday, Sept. 14.—Twenty-five cars Valencias, one Rialto Lates, one lemon sold. Market firm on all small sizes Valencias, easier on larger sizes. Weather fair.

and Absolute Safety for your Savings!

The SECURITY TRUST & SAVINGS BANK of Los Angeles is the oldest and largest savings bank in Southern California, with deposits totalling over Forty Million Dollars. More than 88,000 individuals claim it as their banking home, and of this number many transact all their banking business by mail. You can bank by mail with this big bank with every assurance of the same safety and satisfaction these 88,000 depositors now enjoy. Deposits can be mailed in the form of checks, drafts, money orders or currency in registered mail. Four per cent interest is paid on Term Savings Accounts. Write for full information regarding banking by mail.

DIFFERENT VARIETIES OF WALNUTS

(Continued from Page 271)

quality of this variety was first appreciated by Discher and Ware of Garden Grove. The nut is of large size, decidedly elongated with parallel sides, apex and base of equal breadth or a little thicker at the apex, rather rectangular or square in end view. It has quite a smooth surface and the sutural ridges are not prominent. Nuts are very uniform and are easily distinguished from any other variety. The shell is rather hard, medium thick, heavy and well sealed. The meat is white, plump and easily extracted after cracking, averaging 45 to 50 per cent of the total weight. While the shell is extra heavy the flavor is very good. The growth is extremely vigorous and rapid, making a large tree with heavy and abundant foliage, having the characteristic of growing its nuts in and under the leaves, thus protecting them from the sun. In first looking at a tree it would seem a poor bearer, but when you get under the tree and look up through the foliage, you will find it heavily loaded. This tree comes out in the spring, about the same time as the Mayette, the buds beginning to swell about April 10. It matures its nuts early in the fall before the Mayette and considerably earlier than the Franquette. It is an early and heavy bearer, surpassing all other varieties in this respect. During my observation it is the most blight resisting of any of the walnuts, not only because it comes out late in the spring, but I presume on account of its extreme vigor it actually resists the blight. The Eureka has scarcely a touch of blight. I do not believe there is any variety of walnut that is not touched lightly by it under blight favoring conditions. While the late blooming varieties are resistant in dry localities, in moist districts and under poor soil conditions they are sometimes touched.

The Eureka is entirely free from perforation, probably on account of its strong shell. It is also free from sunburn on account of its abundant foliage and thick husk, as well as bearing the nuts under and among the foliage. It comes nearer to filling the requirements of an ideal walnut than any of the other varieties. It should, however, be grown on heavy soil with good moisture conditions. As the tree is such a vigorous grower and heavy bearer, without sufficient moisture and nutrition it would be impossible for the tree to be sustained and produce a large crop of No. 1 nuts.

The leading varieties for southern California are the Placentia, Neff's Prolific, El Monte and Ware's Prolific. For central and northern California the Eureka is undoubtedly, all things considered, the best variety on heavy soil with good moisture conditions. Then come Mayette, Franquette and Concord, these being better on the lighter soils than the Eureka.

JAKE'S BAD LUCK

"Here," said the proprietor of the place, "is a little gift for you and Jake. Each bottle is finest old Kentucky rye. You drop in at Jake's on your way and give him this, will you?"

"Sure," replied the grateful one.

On his way he fell and broke one bottle.

"Poor Jake!" he murmured, picking himself up.—Pall Mall Gazette.

COMING FAIRS

California fairs and expositions yet to occur this year are as follows:

Ukiah Hop Festival, Ukiah, September 15-20.

Home Industry League Exhibit, San Francisco, September 24-October 5.

Potato Convention, Stockton, September 25-26.

Inland Waterways Convention, Stockton, September 24-26.

Fresno District Fair, Fresno, September 29-October 3.

California Apple Show, San Francisco, October 1-11.

Sacramento Valley Fanciers' Show, Sacramento, October 2-7.

Riverside County Fair, Riverside, October 6-10.

Industrial Fair, San Francisco, October 17-25.

San Francisco Poultry Show, San Francisco, November 8-13.

San Mateo County Poultry Show, San Mateo, November 12-15.

Willows Poultry Breeders' Show, Willows, November 18-21.

Modesto Poultry Show, Modesto, December 2-5.

Stanislaus County Poultry and Pet Stock Show, Modesto, December 1-5.

Porterville Poultry Show, Porterville, December 15-17.

Beautify Your Home

LOS ANGELES September 24, 1914 SAN FRANCISCO

The Personal Side of the State Fair

John K. Cleary and Lieut. Allen. For 21 years Capt. Cleary has had charge of the policing of the state fair grounds. This year he had 50 men to keep the crowds in motion and pickpockets on the outside.

Leon M. Davis and H. S. Baird. Prof. Davis is in charge of the dairy building and Mr. Baird is his assistant.

Ben Rhoades, auctioneer, and Mr. Greer, owner of a fine bunch of jacks and jennets auctioned during the fair.

M. Bassett, the Poland China and Percheron breeder.

Guy Miller leading last year's grand champion in the stock parade.

D. F. Conant leading a blue ribbon winner.

W. J. Hackett, also in the stock parade with a blue ribboner.

N. H. Locke, owner of largest pure bred Jersey herd in California.

C. W. Paine, secretary of the state fair association, on the left, Mr. Taylor of the University farm, and Senator Rush, vice-president of the state fair association, on the right.

Ed. R. Smith of Ocean Park, announcer, and W. P. McNair of Douglas, Arizona, official starter.

Frank L. Mulgrew, director of publicity. The package in Mr. Mulgrew's right hand is Shasta water; we don't know what is in the other hand.

E. Franklin, one of the directors of the fair association, listening to praises of the fair from an old time attendant.

Protect
Your farm, family & stock from drought with a
Deep Well

The man with a deep well doesn't have to worry about the weather. He knows that whether it rains or not he will have plenty of good pure water for irrigation—for live stock—and for domestic use. Shallow wells don't pay. Drill a deep well and be drought-proof.

A Pomona Deep Well Pump is the only pump to use if you desire a sure constant water supply at the least cost.

The Pomona Pump is used in connection with dug, bored or drilled wells from 8-inch inside diameter up, and for capacities of 50 to 1000 gallons per minute, built for pumping from a depth of 75 feet to and including 500 feet.

It lifts water from great depths very economically—works without jerk, jar or vibration—and seldom requires repairs. A man wrote us recently that he had run his Pomona Pump steadily for 2712 hours, with no trouble, and not one cent for repairs—and he is only one of many.

Pomona Deep Well Pumps *are efficient —reliable*

Write for Catalog---or Call and See Us

Our experts will be glad to advise with you without any cost or obligation on your part, if you will call or write us. Our "Pump Catalog No. 54C" will be sent free to any address upon request. When writing state the depth of your well and its location.

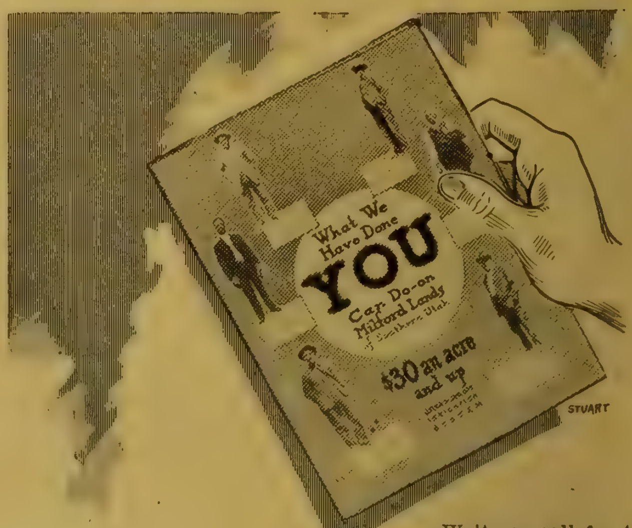
Pay $30 an acre for land worth $250 an acre when in alfalfa



What We Have Done YOU Can Do on Milford Lands
$30 an acre and up
STUART

Write or call for this booklet.

This is an unusual project for unusual people. It is designed for farmers and investors who demand the exceptional. This is a project on which the right man can become rich. This is not for homesteaders—but for those who have already made good, and want an opportunity to do still better.

Special Milford Features

Deep, rich, loamy soil. A soil that will not bake. A soil free from alkali.

Wheat averages 50 bushels to the acre. Oats run 100 bushels to the acre.

Alfalfa—average five tons to the acre—average yearly market value $12 to $15 per ton in the stack.

Potatoes—the very best—they command a premium in any market—400, 500, 600 bushels to the acre every year.

A better dairying country than Southern California. Where dairy products command "Mining Camp Prices" the year around.

A bean country that will rival the Ventura District.

A better hog country than Iowa. Hog cholera unknown. A deciduous fruit country that will equal any fruit valley in the west. Unsurpassed soil for garden truck of every variety.

A climate you will like 365 days in the year.

A gravity irrigation system—abundant water supply—exceptionally low maintenance cost—30c per acre per year maximum. Write or call at once for our illustrated booklet containing live information, facts, figures, and testimonials from practical ranchers who have lived in this rich valley for forty years.

On August 30th a party of Imperial Valley ranchers purchased 1000 acres of Milford land a few hours after stepping on the ground. This is a tribute to Milford soil, climate, water, crops, transportation facilities and investment possibilities that any thinking man will quickly appreciate.

Perpetual water right is sold at $70 per share, with twelve years time to pay for it if desired. Best social and educational advantages—good type of well-to-do neighbors.

Milford is the fastest selling high-class farm land offering placed on the market in the last ten years.

Special excursions at homeseekers' rates on Wednesdays and Saturdays.

Vol. XLIII No. 13 LOS ANGELES: THURSDAY, SEPTEMBER 24, 1914 One Dollar Yearly

Some Notes and Awards at State Fair

The Camera Tells the Best Story of the 61st California State Fair but, a Few Notes and Horse and Cattle Awards are Added. Attendance Rather Lighter than Last Year, but Net Receipts Will Show the Association to the Good.

"Look at that crowd of a few hundred people to see the most magnificent stock parade ever made on the Pacific coast. Then think of yesterday's crowd—a mob of 40,000 shouting people—to see two locomotives made into junk. I would not have missed that parade for $50." That was a remark made by a director of the state fair association in front of the grandstand on Thursday morning. We know it is in good form to refer to the parade as the most magnificent and finest ever, but certainly this year's exhibit of stock at Sacramento was wonderful and gave satisfaction to every well wisher of the state. For years we have urged that more attention be given to live stock, and we believe the industry is coming to its own if the state fair has any promise for the future. The director spoke truly when he referred to the fact that there were but a few hundred people to witness the great exhibits. The governor of California and his staff were present and probably a great number of distinguished people were there to see the stock parade, but for numbers, Wednesday, locomotive smash-up day, was simply astounding. The three great grandstands were jammed. The great enclosure between the grandstand and track was so thickly massed one could hardly push his way through, even the band was so crowded as hardly to be able to operate. Roofs of buildings on the far side of the track were black with people. Telegraph poles around the grounds were also utilized by boys and men as well, all to see a head-on collision. Financially, head-on collisions pay, but agriculturally there isn't much money in thrills.

The weather surprised everybody. It was fine, although Secretary Paine complained because it was too cold. He said: "It takes hot weather to make a successful fair in Sacramento," but for the majority of us it was most agreeable.

One mistake of the management was the moving of the tractor and implement exhibit to an enclosure at the south side of the grounds, without giving due notice by banner or otherwise at the former location, which was at the extreme north end of the grounds. The tractor and threshing machine men felt this was not giving them justice because they got but very little attention from the general run of visitors. Those who came to see that class of implements hunted until they found the place. There were not as many tractors exhibited as last year, but some remarkably fine demonstration work was done, which kept those interested in tractors at attention from early forenoon until evening.

Of course, the classy events of the fair were held in the evening. Society attended in force and filled the stock judging tent, which in the evening became horse show pavilion. These horse shows were really classy and gave sufficient proof that California is not entirely engaged in consuming gasoline. There were five and seven gaited saddlers. There were "hunters" with both ladies and gentlemen in hunting costume, there were tandems and one lady in particular showed much skill in handling two very spirited horses.

A State Fair Poland China

There is one building in which the exhibits, to a casual onlooker, remain much the same each year. This is the horticultural building, or the main building of the grounds. It is given over to the various counties for the making of exhibits of the products of those counties and to booths for the sale of "Pine Nectar," Armour's grape juice, etc. Why Armour's grape juice we were not informed, for it certainly seems that with all the production of grapes which California engages in there might be a bit of California-produced grape juice offered in the main horticultural building of our state fair. By the way, the "dope" which was sold for Armour's "juice" was not a good advertisement, and perhaps it is well that California juice was not dispensed as was the eastern-made stuff.

Fresno County won the $600 prize for the largest and most complete exhibit of products; Placer County, second, $400; Alameda County, third, $250; San Joaquin, fourth, $200; Butte, fifth, $150; Colusa, sixth, $100; Calaveras, seventh, $75; Santa Clara, eighth, $50. For the largest and best exhibit of exclusive farm products San Joaquin won first, $100; Butte, second, $75; Colusa, third, $50. For best display of fruits, vegetables and flowers, Alameda took first money.

"Vote Yes for State Fair Bonds Proposition No. 37 — To Properly House Live Stock" was in evidence at many points on the ground. Additional land has been secured and part of it was used this year in making the place for tractors and implements, but the dairy headquarters are overcrowded. Worse, it has been necessary to divide the dairy exhibits. Some of the cows were placed at the extreme northern end of the grounds and others at the southern. In the milking test, owners of those at the far northern end were compelled to lead their animals to the place of making the test through a jostling crowd of people. No cow with any nerves will stand for such treatment and give her maximum. If the bonds are voted it will be the aim of the management to give ample headquarters for all dairy animals in one section. In addition there will be several large structures to care for other exhibits. The magnitude of the live stock exhibits was not appreciated until almost the last minute, when Secretary Paine found himself with vastly more stock on hand than could be housed. In eight days Secretary Paine secured workmen and material and constructed stalls for 120 cattle and 70 horses.

* * *

CHAMPIONS

The competition for the grand championship honors in all the live stock classes this year was very keen. In the Holstein class the grand champion bull of last year, Lorena Korndyke, and the grand champion cow, Inka Tritomia; of last year, came back and took their positions this year.

Percherons: Champion Stallion, Londricitos, Whitehall Estate; Champion Mare, Fritezi, C. A. Penniger.

Belgians: Champion Stallion, Vulvain De La Cobocherie, G. L. Luhrsen.

Clydesdales: Champion Mare, Lady March, O. H. Brant.

Shires: Champion Stallion, Salvador Forest King, H. Wheatley; Champion Mare, Lady Redlinch, Wheatley.

Champion Jack: Jumbo, C. W. Blevins; Champion Jennie, Jennie Flood, M. A. Merrill.

Beef Cattle.

Shorthorns: Senior Champion Bull, Greenwood King; Junior, Mysie's Knight; Grand Champion Bull, Greenwood King; Senior Champion Cow, Lady Perfection; Junior, September Morn; Grand Champion Cow, September Morn, all owned by T. S. Glide.

Herefords: Senior Champion Bull, Young Donald, Simon Newman; Junior, University Prince, U. of C. Farm, Grand Champion Bull, Young Donald, Simon Newman; Junior Champion Cow, Lenora D, Simon; Grand Champion Cow, Lenora D., Simon.

Red Polled: Senior Champion Bull, Corbet; Junior Champion Bull, Dandy Heil; Grand Champion Bull, Corbat; Senior Champion Cow, Laura Davyson; Junior Champion Cow, Elorie, Grand Champion Cow, Laura Davyson, all owned by R. C. Cartwright.

Dairy Cattle.

Holstein-Friesians: Senior Champion Bull, Lorena Korndyke, Jas. McGillivray; Junior, Prince Juliana Walker, A. W. Morris; Grand Champion Bull, Lorena Korndyke, Jas. McGillivray; Senior Champion Cow, Inka Tritomia

(Continued on Page 296)

All the car lines of the city end at the gate of the fair grounds.

Approach to Horticultural or Main Building from the entrance. Manufactures Building on the right.

A faint impression of Collision Day crowd.

Tandem. One of the features of the evening horse show in the judging tent.

A megaphone announces that everyone must have a fifty-cent piece to lay on the turnstile in order to secure admission. On Wednesday, when the crowd was greatest, the turnstiles were not sufficient to pass the people. Larger gates were opened and directors held large sacks into which the half dollars were dropped.

OLIVES, PICKING AND PICKLING

Written for California Cultivator

By Mrs. M. E. Sherman

(Many subscribers have requested that the following article be reprinted. It was written by Mrs. Sherman for the Cultivator of October 17, 1912, and has been a standard for reference on this subject.)

The equipment furnished by the orchardist consists of ladders, bags and boxes. Stepladders are narrow at the top where they pinch into the third leg that opens out as a support. It makes these ladders more steady if two three-foot pieces are cut at a slant and nailed on each side of the single leg. These pieces spread out on each side and make a fork that prevents the ladder turning sideways. The step part flares out to 24 inches at the base. This gives these side slats on the one leg side a spread of 12 inches from the center, yet they will not project when the ladders are piled away in the off season.

The majority of the ladders are 15 feet long. Every twelfth ladder should be at least 20 feet long. This will give enough long ladders for an ordinary orchard. A number of light poles of bamboo with a wire hook on the end will be very useful to hook over long branches that will bend over readily to reach the pickers' hands. The men must not be allowed to knock off the fruit, but must pick it by hand.

Careful Handling.

We use the smallest size orange picking bag to hold the olives. These bags may have to be shortened, for 15 pounds is as much as should be picked before emptying them, as the under berries crush when a picker moves around with them in the sacks. We make it a rule to have the men empty their sacks every time they come down the ladders, even if they have only a pound in them. The handling of a ladder is rather an awkward matter, and the olives must not be bruised. The 40-pound lug boxes stand close by the trees, and the pickers carefully let the fruit slide into them. There is sometimes a tendency to put in too many leaves, but as these come out in the grading it is not serious. They weigh so little that it is not of much account in the ordinary way of looking at things. The company purchasing, however, is out after faults, and may fuss.

Grading for Size and Color.

As soon as the olives are picked, if the crop is at all large, it will pay to grade them. The grading for size makes them look better, while the grading for color makes a still better pack. When the meat of an olive slips from the pit when squeezed it is ready to pickle, though we often leave them until they grow as black as possible. If there is even a little color on an olive it will darken up when put into the brine.

Where large quantities are handled it pays to have cement troughs, with water piped and cranes for handling the boxes. In handling them for domestic use half barrels are most convenient. We buy whiskey barrels if possible. These are cut in half and the hoops securely nailed to them, and they will last a number of years. We also run around the top, inside and out, a strip of the iron box strapping such as is used on the picking boxes. Now put some lime into these barrels and fill them with water until the time comes to use them. Before using scald them well with hot water. Then into each 12½ gallons of water put 1½ pounds of Greenbank or Hercules lye and a couple of pounds of salt, filling the barrel three-quarters full. We like to put the olives into the water rather than risk bruising by pouring into the empty barrel.

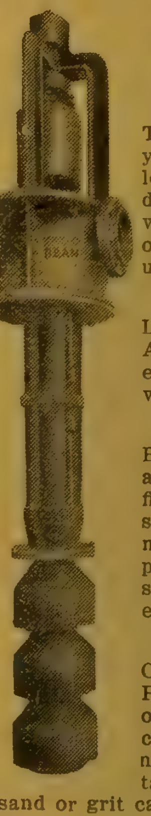
The lyes mentioned are the ones preferred, as they are free from other substances that tend to bleach the olives. This solution is left on until it begins to show in the olive. After 12 hours test the olives by cutting one open, and if a yellow stain reaches almost to the pit the lye is run off and fresh water put on. Put into this water a pound and a half of salt. The water should cover the olives three or four inches. Stir them with a wooden stick every two or three hours. Change the brine every other day. After two days taste, and if the bitterness is not all out repeat the lye. The use of the salt prevents softening of the olives and also fixes the color in a measure. Let the light into the olives when in the brine, but avoid the direct rays of the sun. The necessity for this last caution is not certain, but until it is worked out we think best to do so.

There are ways of hurrying up the olives in pickling them. One is the use of hot lye. If the water the solution is made in is put into the barrels hot and the olives put into it the penetration is quicker. The water at the time the olives are added should be as hot as the hand can bear, not hotter, or the skins may come off. The lye as weak as we have given it is known as a 1½ per cent solution. That is 1½ pounds to 100 of water. It can be left on 24 or 48 hours, for as soon as it has acted on the acid of the juice the olives will render it neutral. Now to salt the olive, as soon as the bitterness is out, make the next water heavier in salt. We usually put in 2½ pounds and leave it on three days, and then five pounds to the 100 of water. Remember that a five-gallon can two and a half times filled with water is about 100 pounds, or 12½ gallons of water is close to 100 pounds. In salting the olives, if we put all the salt into the brine at once the olives will pucker up like a washerwoman's fingers. If this happens, simply put a dose of clear water over them for a couple of hours and then make a weaker solution of brine.

Olives will keep a reasonable length of time in open vessels if the brine is watched and boiled often enough to keep down the bacteria. It is better to can them either in tin or glass while they are perfect. We are using some on the table that have been in glass seven years, and cannot see that they are not as good as those canned last year. As the olives only need to be sterilized to make them keep, it is better to put them into the jars or cans before heating them. Pick them over and drop them into fresh water so they are free from any slime. Make a brine of the same strength they are taken out of. Boil this brine and skim it carefully. When lukewarm cover the olives in the jars or cans with it. Then stand them on boards in the wash boiler. Put water around them half way up to the tops. Put on the cover of the boiler and let them cook. As soon as the water in the jars or cans has boiled five minutes they can be lifted out and sealed at once. Have the covers well washed and in a pan in the oven so they will go on warm. The contraction of a hot jar or can is often too great to make the sealing perfect if the covers are put on cold.

SUPPLY OF POTASH SALTS

Outside of Germany there is no known commercial supply of potash salts. If the German supplies are cut off during the European war, the agricultural world must either go without potash salts after the meager supply now on hand is exhausted or bestir itself to find another adequate dressed to the United States geological survey, and the fertilizing journals report that small quantities of spot source of supply. Already many inquiries regarding potash have been admaterial are changing hands at sharp premiums. The situation is undoubtedly more acute than it was a few years ago when national interest was first awakened to the fact that the United States is entirely dependent on Germany for this important class of fertilizer materials.



Bean Turbine Pump

For Deep Well Work

Install a Bean Turbine Pump and your water problem is solved. It does the work when other types of pumps would be useless.

AUTOMATICALLY WATER-BALANCED, a feature every pump owner will appreciate.

PLENTY OF BEARINGS — they are placed every five feet. This insures perfect alignment and makes possible highest speed and greatest efficiency.

LINE SHAFT IS CENTRAL TO PUMP. — entirely outside of discharge pipes and never comes in contact with water. No sand or grit can get in the bearings.

THREE PIPE DISCHARGE— the pipes being simply and securely bound together. This means strength, yet sufficient flexibility to insure satisfactory work in wells that are not perfectly straight.

DIRECT CONNECTED TO MOTOR—if desired.

Send for further information if you're interested in deep well pumps.

BEAN SPRAY PUMP CO.
West Julian St., San Jose, Cal.

Spraying Time

and there is no better spray than

Scalefoe

Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years, giving the greatest satisfaction without injury, but positive benefit, to the plant. Write for circular with testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

Wide Use of Potash Salts.

Potash salts are employed in many industries other than the fertilizer industry. A large amount is used in glass and soap making and in the manufacture of a number of chemical products. These include potassium hydrate, or caustic potash, and the carbonate and bicarbonate of potash used principally in glass and soap making; the potash alums; cyanides, including potassium cyanide, potassium ferro-cyanide, and potassium ferri-cyanide; various potash bleaching chemicals, dye stuffs, explosives containing potash nitrate, and a long list of general chemicals.

The Work of the Geological Survey

The needs of the manufacturers and the farmers of the country are well known and keenly appreciated by the geological survey. Since the question of a domestic supply of potash salts has become of public interest the government has endeavored to locate deposits in this country and has followed up every clue that seemed to promise results of importance. The survey's work has extended from New York to California and from Michigan to Louisiana, and has covered all branches of investigation where results might be expected, exclusive of the study of kelp. Its investigations have been carried along several lines. (1) Deep drilling for saline residues has been done at Fallon and during the past year in Columbus Marsh and Black Rock Desert, Nevada, and will be continued in Black Rock Desert this year. (2) Natural and artificial brines and bitterns have been collected at all the salt-making establishments in the United States and a great many other localities, and examined. (3) Deposits of alunite and other minerals containing potassiums have been investigated in Utah and other states. (4) Certain occurrences of igneous rock known to contain considerable quantities of potash salts have been examined. Much work has also been done by private initiative along practically all the lines mentioned above. The bureau of soils of the department of agriculture has investigated the kelps. The work is not yet finished and will be pushed with increased vigor provided the necessary funds are supplied.

To all those interested in the subject the geological survey will be pleased to send free of charge the available reports which have been issued on potash salts. Inquiries should be addressed to the Director, U. S. Geological Survey, Washington, D. C.

FUMIGATION PAYS

An interesting exhibit at the state fair was of some of the practical work being done in field and orchard at the University of California. There were samples of grains, samples of soils and samples of many other things agricultural. An exhibit which attracted much attention was a small model of an orange orchard. Some of the trees were being covered with fumigation tents, others were fully covered, while models of the water and acid wagons, both with dummy horses, together with the cart for the cyanide, were almost complete. It gave immediately an idea of the work which, would have necessitated much traveling in orchards during fumigation operations to acquire. In addition to the tents and appliances shown in the model there were other exhibts of cyanide, fumigation pots and so forth.

Speaking of fumigation we are reminded by one correspondent that it is proving one of the most profitable features of citrus orcharding. The writer tells us that one citrus fruit grower at Alhambra has an orchard in which there are nine short rows of trees which failed of fumigation last season because long continued wet weather prevented work at the proper time. The trees which had been fumigated, standing alongside the unfumigated trees and receiving, so far as fertilizer, irrigation and cultivation were concerned, identical treatment, show a setting of fine fruit in large quantity. The unfumigated trees have comparatively no fruit, and it is of low quality.

TO THE CITRUS FRUIT GROWER

Who wants to raise MORE FRUIT and BETTER FRUIT

PRACTICAL EXPERIENCE over many years has DEMONSTRATED to the satisfaction of all keen observers of causes and effects, that SCALE CONTROL is BEST OBTAINED by FUMIGATION with HYDROCYANIC ACID GAS.

CORRECTLY FUMIGATED TREES

PRODUCE

MORE FRUIT AND BETTER FRUIT

CORRECT FUMIGATION may be had only through RIGHT METHODS. The GROWER when fumigating SHOULD KNOW

THAT **chemicals** of **known strength** and **quality** are used, and in **proper quantity, rightly proportioned** to secure correct gas delivery from the generator for safe, efficient fumigation.

THAT **tents** are in **perfect condition** to insure against excess **gas leakage.**

THAT **correct dosage** is always applied—this is best obtained with **marked tents and careful measurements** so that reasonably correct calculations will be made of the cubic space under a tent over a tree—and that the DOSAGE is made to FIT the CUBIC SPACE to be filled with Hydrocyanic Acid Gas.

THAT **dosage charts scientifically figured** are available for field use.

THAT different scale pests, and the same species in different stages of development, require varying gas volume under tents to at all times get highest killing efficiency; this gas volume is controlled by the cyanide dosage and mixing formula for cyanide, acid and water.

THAT **the mixing formula** (the proportions of cyanide, acid and water) MUST be RIGHT, as too **little acid for a given** amount of cyanide **interferes** with the **chemical reaction, too much** means **waste, too little** water causes **explosive generation** and the crystallizing (freezing) of residue, **too much** water REDUCES the GAS DELIVERY, **wastes cyanide** and **impairs efficiency.**

THAT the proportions of cyanide, acid and water to secure maximum gas delivery from a given amount of cyanide have been scientifically worked out and should be carefully followed, except

THAT when operating on SMALL TREES with a cyanide dosage of 3 OUNCES and under the formula should be changed—double the amounts of acid and water.

THAT reasonable **supervisory watchfulness** while trees are being treated will insure more careful attention to details by field operators, with **better clean-up results.**

THAT inspection of fumigated trees to determine scale **killing results** should be made not earlier than **seven** and not later than **fourteen** days after being fumigated.

THAT the inspectors should be **competent, painstaking** and **thorough—MEN with** the CONSCIOUS KNOWLEDGE that **important responsibilities rest upon them.**

THAT damages to trees and fruit, while infrequent and small, when compared with benefits obtained, do at times occur, and in most cases **through no fault of the operator;** such damages, to a certain extent at least, should be at the **cost of the grove owner.** Reasonable treatment of the field operator, with **less demand** for **reparation** by the grower, will secure for him better scale-killing results, or, say a MAXIMUM BENEFIT at a MINIMUM COST.

THAT wind is a factor in spreading scale pests; tests made in a unique way show young scale carried as far as 600 feet (possibly farther, **but not satisfactorily proven).**

THAT the **block system** in cleaning infested districts is the only safe method to **insure** getting **full value** out of a clean-up campaign.

THAT **the** grower **by** watchful intelligent and painstaking study of conditions and correct co-operation with field operators will secure **better results** from the money expended for the **fumigation** of his citrus acreage.

THAT the PERMANENCY of the CITRUS FRUIT INDUSTRY hinges on **correct control of scale pests,** and this control is best obtained through the FUMIGATION OF THE TREES WITH HYDROCYANIC ACID GAS.

THAT many testimonials similiar to the following are in our files:

W. H. Jameson Co., Corona, Cal., says:
"In reply to your favor of the 18th we have to say that we are strong believers in fumigation with Cyanide, as we consider it the most practical way to control the scale pest that has as yet been discovered."

Mr. Hemphill, manager for C. C. Chapman, Fullerton, Cal., said:
"Correct fumigation spells clean trees, more and better fruit, highest prices in the market, and larger returns for the grower."

Mr. O. B. Griffin, assistant manager Leffingwell ranch, Whittier, Cal., said:
"The fumigation of citrus trees is a profitable investment for the citrus fruit grower, and properly done will bring large returns."

CYANEGG FOR FUMIGATION R&H Co TRADE MARK

A. F. Call, Corona, Cal., said:
"Replying to your inquiry, I did not suppose any California Citrus Grower in this day and age would doubt the absolute necessity of fumigation for scale. Any man who has scale and cannot fumigate should sell out as soon as possible, for there is no place for him in the business."

Mr. W. C. Hendricks, manager, Azusa Citrus Association, Azusa, Cal., says:
"The cost of fumigating citrus trees should not be considered as a part of the expense account in the handling of a citrus grove, but rather as an investment that brings speedy and large returns on the money paid out."

Deciduous Fruit Culture

PEAR GROWERS MEET

Written for the California Cultivator

We once heard a fruit grower—a most successful one—say in a convention that were it not for the pests and the difficulties generally which confront the fruit growers he would not be in the business. That is, if the conditions were so favorable that any indifferent or lazy orchardist could produce fine fruit the business would soon be so overdone that he would have to quit. He preferred to sit up nights and scheme overtime, when many another had gone to bed grumbling at providence or fate or at something which may have sent him a visitation.

The pear growers in the Sacramento valley are offered a similar opportunity to make money on pears. A few are taking advantage of it; more are not. In fact so many are not that some alarm is felt that they and the state will suffer serious loss unless they wake up and get into action and wipe out pear blight.

Pear blight has ruined thousands of acres of fine orchards in the Sacramento Valley and some orchards are looking today as if a fire had swept through them. For some reason, climatic or otherwise, blight is far worse than for years. To discuss the matter and devise means of bettering conditions a meeting was held in Sacramento Wednesday, September 16, at which the most progressive pear growers were present.

Unfortunately the attendance was not as heavy as the subject would seem to demand, but the few who were there determined to take up the fight to wipe out the pear blight. One feature of the meeting was a trip across the river to view the work of Hayward Reed. Mr Reed's large orchards have proven wonderfully profitable, and for more than ten years he has been a consistent fighter of the blight. At the present time he is spending $125 daily in keeping his force actively cutting and pruning blighted branches. He has followed the method prescribed by Prof. Waite, sent here by the department of agriculture more than 10 years ago, and, as remarked in the meeting, there has been little added to the knowledge of pear blight and methods of handling since Prof. Waite's investigations.

The most perplexing feature of the problem is the indifferent grower who is permitting his orchards to die with the blight and to infest neighboring trees. Mr. E. A. Gammon, a large grower on the river whose faith in the pear industry is such that he is still planting thousands of trees, was chairman of the meeting. As he remarked, the question was not so much one of the pear tree or the pear blight as of the pear grower.

Commissioner Stabler of Sutter County felt that it was a matter largely for the horticultural commission. Rigid enforcement of the law without favor to any would soon end, or at least bring under control the blight question. The trouble is many sections do not fully sustain the horticultural commissioner in his effort to eradicate pests. He felt that we cannot control pear blight by resolutions.

In a word, the resolutions called for fuller support of the horticultural commissioner and contained an appeal to the state university and to the federal department of agriculture for all the aid possible as to best methods. It was ruled that a copy of the resolutions be mailed to every county supervisor in the state of California.

Dean Thos. F. Hunt, director of the state experiment station, was present and wished to know what was desired of the state university. It was anxious to aid in every way, and as had been remarked, Prof. Waite's instructions were ample if the grower would carry them out. There was no very definite answer given to Dean Hunt, but presumably the university will take a hand in the present fight.

One of the first steps felt necessary is the organization of growers in every district in the state.

WALNUT GROWERS' BULLETIN

The California Walnut Growers' Association will name opening prices, new crop walnuts, Thursday, Septembe 24. All of our brokers will immediately thereafter receive wire giving full details which will be passed on by our broker in your market without delay.

Foreign Situation

We had hoped to have more definite information regarding the foregn walnut situation to place before you before opening prices were named by us. We have had several cables out to our two European agents for six days. These have evidently not been delivered nor have we had any cables from Europe for the last week. Are unable to account for this situation unless the cable censors have refused to let our wires pass. It is almost impossible to get prompt wire service with the continent at present. We hope to have some further cable information, however, before naming prices, and any developments of importance will be wired to our brokers on the night of September 23, and this information will be available to you.

What seems to be of particular interest is whether or not France has placed an embargo on the exportation of walnuts. We have information both ways and are just today in receipt of wire from Mr. A. H. Baldwin, chief of bureau of foreign and domestic commerce at Washington, as follows: "Walnuts not specified among articles subject embargo France in documents so far received bureau."

Also we were advised under date of August 15 by cable from one of our European representatives that walnuts were excluded from French embargo. However, on September 4 we received cable from this same agent advising that walnuts were now included in this embargo, which cable was confirmed on same date, our agent stating in part as follows: "With respect to the exportation of walnuts, we have been making the closest inquiries in France and learn officially that the embargo placed by the French government on foodstuffs includes walnuts. We have thereupon cabled you this information today. As, however, we have written you in our previous letters, even if this embargo did not exist, we cannot see how exports can be made. The northern armies now lie right across the Calais-Boulogne-Paris road and probably will cover the Havre road shortly. With regard to Bordeaux, it is practically impossible to get anything into the port from the interior on account of the lack of rail facilities and shortage of labor. The Grenoble district is very close to the theatre of war and in fact large quantities of German prisoners are being interned near there. Marseilles is the port for Grenoble, but there is very little shipping available, even if walnuts could be sent through. We are informed that the embargo will very probably continue until the end of the war, and if this is so, there will be no shipments this season. We will, however, keep in close touch, that is so far as we are able, and let you know immediately of any fresh developments."

Please tell the advertiser that you read his advertisement in this paper. Now, don't go away and forget it.

We are placing these conflicting statements before you that you may draw your own conclusions. We will undoubtedly wire something absolutely definite regarding this embargo to the brokers on September 23.

The latest estimate we have of the French crop was under date of August 15, placing the total figures, all grades, at 15,600 tons, made up as follows: Mayettes, 1900 tons; Marbots, 5200 tons; Cernes, 5000 tons; all other varieties, 3500 tons. This is a slight increase over last year's light production. Our figures on the Italian crop are above normal; total crop estimate, under date of August 7, nearly 2000 tons. We understand that Italian troops are fully mobilized. The above figures were based on the entire crop being harvested. It is reasonable to suppose, in view of recent developments, that a large portion of the French crop may not be harvested. We are also informed that the German-Japanese affair in Shantung province, China, will undoubtedly delay importation of best grade "Manchurian" walnuts, which are largely produced in Shantung province. The maximum importation of Chinese walnuts to the United States in any previous year was less than six million pounds, of which only 33 per cent reached here before January 1. During the year ending June 30, 1912, France, Italy and China imported to this country 32,452,000 pounds of walnuts. Total imports that year were 37 million pounds. There were consumed in the United States in the same period, 62 million pounds of walnuts. The California production this year will not exceed 20 million pounds, and final estimates of the crop we are now securing from all growers indicate that the total crop will only run to 17½ million pounds. Our experience is, however, that growers usually underestimate their production. Taking for granted that California will ship the maximum estimate of 10,000 tons and that the entire crop of France, Italy and China is dumped on the American market this season, the supply will still be below the consumption for the one year period above referred to. In view of the troubled conditions abroad, it is reasonable to suppose that at best but a portion of their total crop will reach our shores before the turn of the year.

California Crop Conditions

The light California crop continues to show excellent quality and we believe that shipments will all be completed by November 5 unless unfavorable weather conditions are encountered.

In conclusion we wish to state that it will be our policy this season to name prices which we believe will move the California crop speedily, and we hope that the quality of our deliveries and the service we give our trade this season will prove entirely satisfactory and warrant a continuance of past patronage.—California Walnut Growers' Assn.

REDWOOD SAWDUST PACKING FOR GRAPES.

By packing California table grapes in redwood sawdust shippers last season were enabled not only to increase greatly their domestic trade but to export several thousand drums or barrels to the West Indies and South America. They sold abroad at prices fully equal to and sometimes in excess of the prices paid for imported Spanish Almeria grapes packed in ground cork. One small lot was exported and sold in London. A carload of 600 drums was also sent to Mexico City, where unusual conditions raised the price to approximately $5,000 for the lot.

The improved packing which made these export shipments possible was also a great stimulus to the domestic trade. By packing with redwood sawdust, a method developed by the United States department of agriculture, shippers were enabled to hold their fruit successfully in storage at eastern points for periods of from 30 to 60 days or until the end of the Christmas holidays. Thus very satisfactory prices were obtained between November 20 and January 5.

The result was a new record in the marketing of California table grapes. The shipments from the San Joaquin Valley to the principal markets of the United States and Canada increased in 1913 to 70 carloads or twice the amount shipped in 1912.

For three successive years now the grape storage investigations conducted by the bureau of plant industry of the department have borne fruit in the successful shipment of grapes packed in redwood sawdust. Under favorable conditions of handling large commercial shipments of these grapes have been sold at auction at an average price of more than 15 cents per pound or $300 per ton. And on the other hand, poorly graded, inferior fruit unfit for storage purposes has not only been handled at a loss but has served in some cases to prejudice fruit buyers against all California grapes packed in redwood sawdust.

During the packing season of 1913 there was an active demand for the sawdust packed grapes in drums. Many orders were received by the California shippers and a considerable portion of the crop packed in drums was sold to jobbers in various markets of the country at a uniform price of $2.25 a drum f. o. b. California. Growers however who sold their own sawdust packed grapes at auction in New York or Chicago secured, after deducting freight and storage charges which amounted to about 90 cents a drum, a much higher average return than these f. o. b. California prices yielded. Reports of the auction sales in New York show that 3,389 drums were sold between November 28 and December 12 at an average price of $3.58 a drum, while 3,980 drums were sold from December 15 to January 5 at an average price of $4.05. In Chicago 3,482 drums were sold at an average price of $3.83 a drum.

The experimental results and commercial phases of handling California table grapes packed in drums with a filler of redwood sawdust are fully discussed in a recent bulletin of the department of agriculture entitled "Factors Governing the Successful Storage of California Table Grapes." This publication, which describes the handling, shipment and storage of grapes packed in redwood sawdust according to methods developed in the department's work, will be sent free on application as long as the department's supply lasts. Special emphasis is placed in this publication on the necessity of improving the commercial grading and packing of fruit intended for storage beyond the regular marketing season.

While the market prices received for sawdust packed grapes appear to be exceptionally high, shippers must remember that this method of handling the fruit is expensive. Only fruit of the best quality, uniformly graded and properly packed, should be used. The growers and shippers who have exercised the greatest care in the handling of grapes packed in redwood sawdust have realized exceptionally high prices, but on the other hand, those who have shipped poorly graded and inferior fruit have done so at a loss and have also served to lower confidence in the standard fruit.

The Red Emperor Grape.

The success of the past season has been a pronounced victory for the Red Emperor grape. The Red Emperor is at present the only variety grown in commercial quantities which possesses storage and shipping qualities in any way comparable to those of the Spanish Almeria, its chief competitor in foreign and domestic markets. It ripens however late in the season and reaches the most profitable markets at a time when these are already flooded with the products of vineyards closer by.

Partly on this account the demand a few years ago for Emperor grapes was restricted and the production of these grapes had ceased to be profitable as compared with other fruit growing enterprises in California. The result was that many of the grape growers seriously considered uprooting their vineyards or grafting them over to other varieties. But the introduction of the sawdust drum package has made it possible to hold the grapes in cold storage until after the regular season. The Red Emperor grows in large handsome bunches weighing from a pound and a half to two pounds and when it can be placed on the market in good condition for the holiday season it meets with a hearty welcome. The result is that the production of Emperor grapes has already been placed on a new and profitable basis.

The storage experiments however reported in the department's bulletin have dealt with all the more important varieties and have involved a thorough study and trial to determine the possible maximum holding period of the grapes in storage and their behavior during transportation to market. Problems relating to the propagation in California of Almerian and other long keeping varieties are now receiving attention with a view to the introduction of new and promising varieties especially adapted to shipment and storage in drums or barrels.

Two years and under three—1, Mordu, C. G. Albrecht; 2, Insurance, H. G. Learned; 3, Buster, C. A. Penniger. One year and under two—1, Star, C. A. Penniger; 2, Marvel, Edmund Miller; 3, Ebro, Elliott-Brant. Mares, four years and over, and foal at feet—1, Kate and foal, M. G. Learned; 2, Copula and foal, Wm. Bond. Four years or over—1, Fritzie, C. A. Penniger; 2, Pink Julia, H. G. Learned; 3, Kamiche, M. Bassett. Mares, three years and under four—1, Como, Ruby & Bowers; 2, Lili, Whitehall Estate. Two years and under three—1, Marie, Ruby & Bowers; 2, Miss Inquiet, Wm. Bond. One year and under two—1, Patty, H. G. Learned. Foals under one—1, Bay Boy, H. G. Learned; 2, Copula's Colt, Wm. Bond. Get of Sire, four animals under four years—1, Get of Inimitable, G. A. Penniger.

Belgians.

Free for All—Stallions four years or over—1, Vulcain de la Cabocherie, G. J. Luhrsen; 2, Champaigne, A. L. Watson.

Clydesdales.

Free for All—Mares, four years or over, with foal at feet—1, Florence Lynn and foal, Ruby & Bowers. Mares four years or over—1, Lady March, O. H. Brant; 2, Roseleaf, Ruby & Bowers. Foals, stallion or filly, under one year—1, Trilby, Ruby & Bowers; 2, 293-A; 3, stallion colt, O. H. Brant.

Shires.

Free for All—Stallions four years or over—1, Harboro Combination, Henry Wheatley; 2, Severn Pilot, McCormick Brothers; 3, Botolph King John, Henry Wheatley. Two years and under three—1, Salvador Forest King, Henry Wheatley; 2, Severn Donald, McCormick Brothers. Mares four years old or over, and foal at feet—1, Violet and foal, Henry Wheatley; 2, Mellington Princess and foal, Henry Wheatley. Mares four years or over—1, Lady Redlynch, Henry Wheatley. Mares, one year and under two—1, Salvador Queen, Henry Wheatley; 2, Salvador Champion Princess, Henry Wheatley. Foal under one year—1, Filly foal, Henry Wheatley; 2, Stallion foal, Henry Wheatley; 3, Stallion foal, Henry Wheatley. Produce of Dam—1, Produce of Violet, Henry Wheatley; 2, Produce of Mellington Princess, Henry Wheatley.

Shires, State Class.

Stallions, four years or over—1, Harboro Combination, Henry Wheatley; 2, Severn Pilot, McCormick Brothers; 3, Desford Banker, Henry Wheatley. Stallions, two years and under three—1, Salvador Forest King, Henry Wheatley; 2, Severn Donald, McCormick Brothers. Mares, four years or over, and foal at feet—1, Violet and foal, Henry Wheatley; 2, Mellington Princess and foal, Henry Wheatley. Four years and over—1, Lady Redlynch, Henry Wheatley. One year and under two—1, Salvador Queen, Henry Wheatley; 2, Salvador Champion Princess, Henry Wheatley. Foals under one year—1, Filly foal, Henry Wheatley; 2, Boro Mayflower's foal, E. W. Westgate; 3, Stallion foal, Henry Wheatley. Produce of dam, two animals under four years—1, Produce of Violet, Henry Wheatley; 2, Produce of Mellington Princess, Henry Wheatley.

BEEF CATTLE

Shorthorns

Bulls, three or over—1, Ringleader, T. B. Gibson; 2, College Count, 3d, Howward. Bulls, two and under three—1, Greenwood King, T. S. Glide; 1, Hillcrest 9th, T. S. Glide; 2, Fond Lavender, Howard, Bulls, junior yearling—1, College Count 20th, Howard.—Bull, senior calf—1, Mysie's Knight, T. S. Glide; 2, Roselawn Choice 81st, T. B. Gibson; 3, Hopland Tom, Hopland; 4, Roselawn Prince 82d, T. B. Gibson; 5, Harvardian, Howard Cattle Co. Bull, junior calves—1, Lancaster, King, T. S. Glide; 2, Winsome Prince, Howard; 3, Roselawn Favorite 84th, T. R. Gibson; 4, Hopland Master, Hopland; 5, Promise, Howard. Cows, three years old or over—1, Greenwood Maid, T. B. Gibson; 2, Little Missus 5th, Howard; 3, Flower Girl 14th, T. S. Glide. Cows, two and under—1, Lady Perfection, T. S. Glide; 2, Roselawn Queen 56th, T. B. Gibson; 3, Winsome Countess, Howard. Cows, senior yearling—1, Mary Lancaster, T. S. Glide; 3, Little Missus 7th, Howard; 3, Blossom Countess, Howard. Cows, junior yearling—1, Snow Girl's Queen, Hopland; 2, Spicy Maid, T. S. Glide; 3, Eigitha's Queen, Hopland. Senior Calves—1, September Morn, T. S. Glide; 2, Hopland Lass, Hopland; 3, King's Lassie, T. S. Glide; 4, Ringleader's Violet 74th, T. B. Gibson; Roselawn Daisy 73d, T. B. Gibson. Junior calves—1, Hillcrest Countess, T. S. Glide; 2, Ramona Miss, Howard; 3, Hopland Gay Lass, Hopland; 4, Ringleader's Beauty, T. B. Gibson; 5, Roselawn Belle 77, T. B. Gibson. Shorthorn Aged Herd—1, One Entry, T. S. Glide; 2, Aged Herd, T. B. Gibson; 3, Aged Herd, Howard. Shorthorn Breeder's Young Herd—1, One Entry, T. S. Glide; 2, One Entry, Hopland; 3, One Entry, Howard. Calf Herd—1, One Entry, T. S. Glide; 2, One Entry No. 2, T. B. Gibson; 3, One Entry, Hopland. Group, four animals—1, Get of sire, T. S. Glide; 2, Get of sire, Hopland; 3, Get of sire No. 1, T. B. Gibson. Group, two animals either sex—1, Produce of dam No. 1, T. S. Glide; 2, Produce of dam No. 2, T. S. Glide; 3, Produce of dam No. 1, T. B. Gibson.

Shorthorns, State Class

Shorthorn Bulls, three or over—1, Ringleader, T. B. Gibson; 2, College Count 3d, Howard. Bulls, two and under three—1, Greenwood King, T. S. Glide. Bull, senior yearling—1, Hillcrest Knight, T. S. Glide; 2, Fond Lavender, Howard. Bull, junior yearling—1, College Count 20th, Howard. Bull, senior calf—1, Mysie's Knight, T. S. Glide; 2, Roselawn Choice 81st, T. B. Gibson; 3, Harvardian, Howard; 4, Roselawn Prince 2d, T. B. Gibson; 5, Collegiate, Howard. Bull, junior calf—1, Lancaster King, T. S. Glide; 2, Winsome Prince, Howard; 3, Roselawn Favorite 84th, T. B. Gibson; 4, Hopland Master, Hopland; 5, Promise, Howard. Cows, three or over—1, Greenwood Maid, T. B. Gibson; 2, Little Missus 5th, Howard; 3, Flower Girl 14th, T. S. Glide. Cows, two and under three—1, Lady Perfection, T. S. Glide; 2, Roselawn Queen 56th, T. B. Gibson; 3, Countess Churchill, Howard. Cows, senior yearling—1, Mary Lancaster, T. S. Glide; 3, Blossom Countess, Howard. Cows, junior yearling—1, Snow Girl's Queen, Hopland; 2, Spicy Maid, T. S. Glide; 3, Eigitha's Queen, Hopland. Cows, senior calf—1, September Morn, T. S. Glide; 2, Hopland Lass, Hopland; 3, King's Lassie, T. S. Glide; 4, Ringleader's Violet 74, T. B. Gibson; 5, Roselawn Daisy 72, T. B. Gibson. Cow, junior calf—1, Hillcrest Countess, T. S. Glide; 2, Ramona Miss Howard;

The upper picture in the series is of Forti, leader of the band, famous about the bay and in all northern California. Director Forti always remembers and plays the Dead March on Thursday morning just as the beef breeds pass the grandstand.

Tevis Paine, son of the secretary of the fair association, and all round useful man in leading parades, etc.

A. M. Henry, breeder of Poland Chinas, on left, and Dr. L. J. Belknap, a lover of the Jersey.

Mr. Daniels, a believer in the milking machine.

Going up. A crowd watching the baloon as the cable is played out to let the captive go up 2000 feet. The tower in background brilliantly illuminated every evening.

Manager Stearns of the Stanford University ranch at Vina, and Mr. Lettow of the Cultivator.

3, Hopland; Gay Lass, Hopland; 4, Ringleader's Beauty 81st, T. B. Gibson; 5, Roselawn Belle 77, T. B. Gibson. Aged herd, state class—1, Aged herd, T. S. Glide; 2, Aged herd, T. B. Gibson; 3, Aged herd, Howard. State class, breeders' young herd—1, Breeder's young herd, T. S. Glide; 2, breeder's young herd, Hopland, 3, breeder's young herd, Howard. Calf herd—1, calf herd, T. S. Glide; 2, calf herd No. 1, T. B. Gibson; 3, calf herd, Hopland. Group to consist of four animals, either sex—1, one entry, T. S. Glide; 2, get of sire, Hopland, 3, get of sire No. 2, T. B. Gibson. Two animals, either sex—1, one entry, T. S. Glide; 2, one entry, T. S. Glide; 3, produce of dam No. 1, T. B. Gibson.

Herefords

Bulls, three or over—1, Young Donald, Simon Newman Co. Bulls, two and under three—1, Hesiod Lad, Simon Newman Co. Bull, junior yearling—1, Newman's Crest, Simon Newman Co. Bull, senior calf—1, Donald's Signet, Simon Newman Co. Bull, junior calf—1, University Prince, University of California. Cows, three or over—1, Lenora B, Simon Newman Co.; 2, Sugar Plum, Simon Newman Co. Cows, two and under three—1, Mary Queen, Simon Newman Co. Junior yearling cow—1, Silver Fern, Simon Newman Co.; 2, Lenora C., Simon Newman Co. Cows, senior calf—1, Pearl Gem, Simon Newman Co. Cow, junior calf—1, Lenora D., Simon Newman Co. Hereford Aged herd—1, aged herd, Simon Newman Co. Breeder's young herd, Simon Newman Co. Calf herd—1, Calf herd, Simon Newman Co. Hereford group of four animals—1, Get of Young Donald, Simon Newman Co. Hereford group of two animals—1, Produce of Lenora B., Simon Newman Co.; 2, Produce of Pride of Humboldt 24, Simon Newman Co.

Red Polled

All awards to Reevy R. Cartwright.

Fat Cattle

Shorthorn Steer or Spayed Heifer—1, Snowball, U. of C.

Hereford Steer or Spayed Heifer—1, Chief Lad, Simon Newman Co. Hereford Steer or Spayed Heifer, one year and under two—1, Prince Donald, U. of C. Hereford Steer or Spayed Heifer, six months and under one year—1, California Hope, U. of C.

Aberdeen Angus Steer or Spayed Heifer, two years and under three—1, Thickset Boy, U. of C. Aberdeen Angus Steer or Spayed Heifer, one year and under two—1, Black Prince, U. of C.

Grades and Crosses, Steer or Spayed Heifer, two years and under three—1, Eddie, T. S. Glide. Steer or Spayed Heifer, one year and under two—1. Maxwell King, T. S. Glide. Steer or Spayed Heifer, six months and under one year—1, California Choice, U. of C.; 2, Ruddy, T. S. Glide; 3, Punch, T. S. Glide.

DAIRY CATTLE

Holstein-Friesian

Holstein-Friesian Bulls, three years old—1, Lorena Korndyke, A. W. Morris & Sons; 2, King of the Pontiacs 14th, Leland Stanford, Junior University; 3, Genesea Lad, Leland Stanford Junior University; 4, Korndyke Pietertje of Oakwood, James McGillivray; 5, Dutchland Colantha Sir Ormsby, Leland Stanford University. Bulls, two years and under three—1, Segis Pontiac De Kol Burke, Morris; 2, Lady Wander Pietertje De Kol, Dr. Ben Stetson; 3, King Korndyke Pontiac, A. W. Morris & Son; 4, Korndyke Pietertje Tritomia, James McGillivray Bull, senior yearling—1, Juliana De Kol King Segis, Morris; 2, Pure Gold Brookside Clothilde, Pure Gold Stock Farm; Canary Prince of the West Johanna, Leland Stanford Junior University; 4, Aralia Del Kol Pontiac Segis, Morris. Bull, junior yearling—1, Spotland Canary of Vina, Leland Stanford Stanford University; 2, Hartog Colantha Korndyke, James McGillivray; 3, Sir of the Canary Band, Stanford Univ.; 4, Sir Hans Korndyke, Jas. McGillivray. Bull, senior calf—1, Prince Juliana Walker, Morris; 2, Segis Creamcup Pontiac, Morris; 3, California Fidessa Korndyke, U. of C.; 4, King Stanislaus, Frank Hatch. Bull, junior calf—1, King Clyde Korndyke, Morris; 2, Sir Hengerveld Orlissa De Kol, Stanford Univ.; 3, Sir Segis Pontiac Mead, Morris; 4, Skylark Netherland Korndyke, Morris. Cow, four or over—1, Inka Tritomia 2d, Jas. McGillivray; 2, Aaggie Acme of Riverside, Morris; 3, Romeo Aaggie Louise, Jas. McGillivray; 4, Floa Bergsma Butter Girl, Morris; 5, Toma, Stanford Univ. Cows, three under four—1, Leda Gerben Alcartra 2d, Morris; 2, Boweda, Stanford Univ.; 3, Diotime Clyde Korndyke, Morris; 4, Helen Nye Skylark, Morris; 5, Canary Delphina, Stanford Univ. Cows, two years and under three—1, Jane Netherland Segis, Morris; 2, Cobossie Korndyke Queen De Kol, Morris; 3, Queen Segis Hengerveld of Norwood, Frank Hatch; 4, Canary Saltertia, Stanford Univ.; 5, Leda Hengerveld De Kol Korndyke, Morris. Senior yearling heifer—1, Margaret Terpstra Korndyke, Morris; 2, Inka Tritomia Maid, Jas. McGillivray; 3, Lady Hiske Walker, Morris; 4, Pearl Beets 2d, Morris; 5, Lady Pontiac Pauline of Vina, Stanford Univ. Junior yearling heifer—1, Squaw Queen Johanna, Stanford Univ.; 2, Princess Ledga Hartog Inka, Frank Hatch; 3, Ethel Riverside Pontiac, Morris; 4, Heifer, Jas. McGillivray; 5, Gracia Colantha Burke, Stanford Univ. Senior heifer calf—1, Modesto Portia Korndyke, Morris; 2, Dora Spofford Korndyke, Morris; 3, Princess Autun Cornucopia, Stanford Univ.; 4, Empress Parthenca Pontiac, Morris; 5, Heifer, Jas. McGillivray. Junior Heifer Calf—1, Durmelia Pontiac Korndyke, Stanford Univ.; 2, Velma Korndyke, Netherland, Morris; 4, Segis Contenta Pontiac, Morris; 5, Lady Pontiac May, Stanford Univ. Aged herd—1, A. W. Morris; 2, aged herd, Stanford Univ.; 3, A. W. Morris; 4, aged herd, Jas. McGillivray. Breeders' Young Herd—1, A. W. Morris; 2, Stanford Univ.; 3, A. W. Morris; 4, Jas. McGillivray. Calf herd—1 and 3, A. W. Morris; 2, Stanford Univ. Get of sire, four animals—1 and 2, A. W. Morris; 3, Get of Canary Johanna Victoria, Stanford Univ.; 4, Get of King of the Pontiacs 14th. Stanford Univ. Produce of Dam, two animals—1 and 3, A. W. Morris; 2, Produce of Granfur, Stanford Univ.

Jerseys.

Jersey Bulls, three or over—1, Rochettes's Noble, C. P. Hembree; 2, Altama Interest, Guy H. Miller; 3, Valet's King of Lockeford, N. H. Locke Co.; 4, Alva Lady's La Foss Boy, S. F. Williams; 5, Signor Bruce's Fox, W. J Hackett. Bulls, two years and under three—1, The Imp of Lockeford, J. B. & J. W. Thorp; 2, Pansy's Bertie Lad, D. F. Conant; 3, Weiland's Silver Marquis, W. W. Fisk; 4, Leda's Golden Laddie of Lockeford, N. H. Locke Co; 5, Norma's Gertie's Son of Lockeford, N. H. Locke Co. Bull, senior yearling—1, Undulata Prince, C. P. Hembree; 2, Lorna's Altama Interest, C. D. Haworth; 3, Maidkin's Fox, Jas. T. Miller; 4, Pearl's Silver Interest, G. H. Miller. Bull, Junior Yearling—1, Rochette's Noble Fountain, C. P. Hembree; 2, Foxy Laddie of Lockeford, N. H. Locke Co.; 3, Butler Boy, Jr., Rancho Dos Rios; 4, Rosebud's King of Lockeford, N. H. Locke Co.; 5, Girl's Noble Peer. C. B. Hembree. Bull senior calf—1, Rochette's Noble Pearl, C. P. Hembree; 2, California Peer, N. of C.; 3, Golden Marquis 2d, J. B. & J. E. Thorp; 4, Victoria's Lad R. S. M., D. F. Conant; 5, Inarita Pogis, Rancho Dos Rios. Junior bull calf—1, Noble's Golden Rochette, C. P. Hembree; 2, Brilliant Spray's Marquis, C. P. Hembree; 3, Olga Rhyme's King of Lockeford, N. H. Locke Company; 4, Oliera's Dron, Rancho Dos Rios; 5, Warder's Teddy Stake Pogis of Lucerne Farm, W. W. Fisk. Cows, four years old or over—1, Imp. Brilliant Spray, C. P. Hembree; 2, Amethyst of Venadera, G. H. Miller; 3, Lemola Bell, N. H. Locke Co.; 4, Salmuera, Rancho Dos Rios; 5, Paulas Golden Maid. Cow, three years and under four—1, Salome of Mossdale, J. B. & J. E. Thorp; 2, Valet's Golden Biddy of Lockeford, N. H. Locke; 3, Prince Bosnia, C. P. Hembree; 4, Gertie's Foxy Alene, N. H. Locke Co. Cow, two years old and under—1, Financial Prospect of Lockeford, N. H. Locke Co.; 2, Valet's Dairymaid of Lockeford, N. H. Locke Co.; 3, Lois of Valley View, W. W. Fisk; 4, Logrero's Regina, W. J. Hackett; 5, Stockwell's Birdie, C. P. Hembree. Jersey senior yearling heifer—1, Noble Peer's Golden Rupee, C. P. Hembree; 2, Mermaiden's Fern, U. of C.; 3, Valet's Fresno Lemola of Lockeford, N. H. Locke Co.; 4, Altama's Goldie, W. J. Hackett; 5, Valet's Violet of Lockeford, N. H. Locke Co. Jersey junior yearling heifer—1, Noble Peer's Jewel, C. P. Hembree; 2, Noble Peer's Violet, C. P. Hembree; 3, Champion's Figgis, Jas. A. Goodall; 4, Porilla, Rancho Dos Rios. Senior heifer calf—Noble's Aley, C. P. Hembree; 2, California Mermaiden, University of California; 3, Warder's Golden Lucy of Lucerne Farm, W. W. Fisk; 4, Pegajosa, Rancho Dos Rios; 5, Leonard Farm Foxy Girl, W. J. Hackett. Ground Limestone
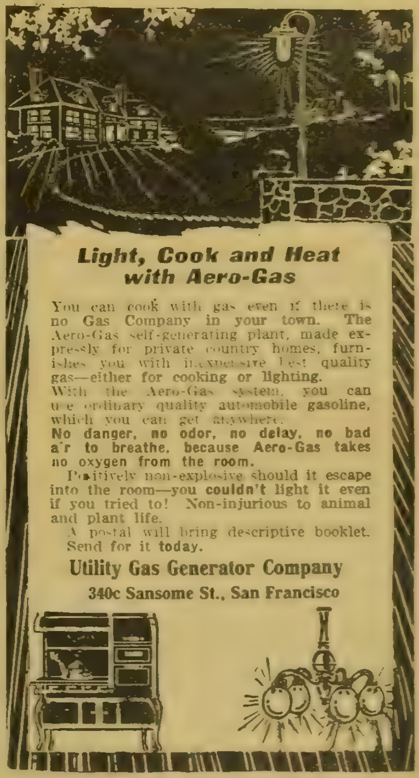
for
Agricultural Purposes

WESTERN ROCK PRODUCTS COMPANY SAN FRANCISCO
WESROCK QUALITY

Our ground limestone for fertilizing is made of the highest quality of limerock obtainable, is an honest material, honestly prepared. It is ground to that fineness which the Agricultural Department of the University of California recommends as rendering the greatest efficiency. Ground limestone sustains the fertility of the soil, corrects acidity, makes clay and clay adobe soils looser and easier to cultivate, etc. You can get prompt deliveries from us either in bulk or packed in 100-pound sacks. Write us for further information, prices, terms, etc.

Western Rock Products Co.
Balboa Bldg., San Francisco



Light, Cook and Heat with Aero-Gas

You can cook with gas even if there is no Gas Company in your town. The Aero-Gas self-generating plant, made expressly for private country homes, furnishes you with inexpensive best quality gas—either for cooking or lighting.
With the Aero-Gas system, you can use ordinary quality automobile gasoline, which you can get anywhere.
No danger, no odor, no delay, no bad air to breathe, because Aero-Gas takes no oxygen from the room.
Positively non-explosive should it escape into the room—you couldn't light it even if you tried to! Non-injurious to animal and plant life.
A postal will bring descriptive booklet. Send for it today.

Utility Gas Generator Company
340c Sansome St., San Francisco

WATER PIPE CHEAP

200,000 FEET

All Sizes—Immediate Delivery.

Just received several carloads new and second-hand Water Pipe, Oil Well and Water Casing. Water pipe (per foot), ½-inch, 2½c; ¾-inch, 3c; 1-inch, 4c; 1¼-inch, 5c; 1½-inch, 6c; 2-inch, 7c; 3-inch, 15c. O. D. Casing (per foot), 2-inch, 6c; 3-inch, 12c; 3½-inch, 15c; 4-inch, 17c. Riveted pipe (per foot), 4-inch, 12c; 10-inch, 30c—also surface irrigation pipe. Many other sizes to select from. Prompt shipment. Write, wire or phone. Adams Pipe Works, 2030 Bay St., Los Angeles, Cal. Phones: Broadway 1264—F1917. (Under entirely new management.)

The Most Popular Pump on the Market

Layne & Bowler Pump

The extraordinary service and the perfect satisfaction this pump renders, has resulted in its overwhelming popularity thruout the Great Southwest. Hundreds of western irrigators testify to the wonderful results the Layne & Bowler Pump gives.

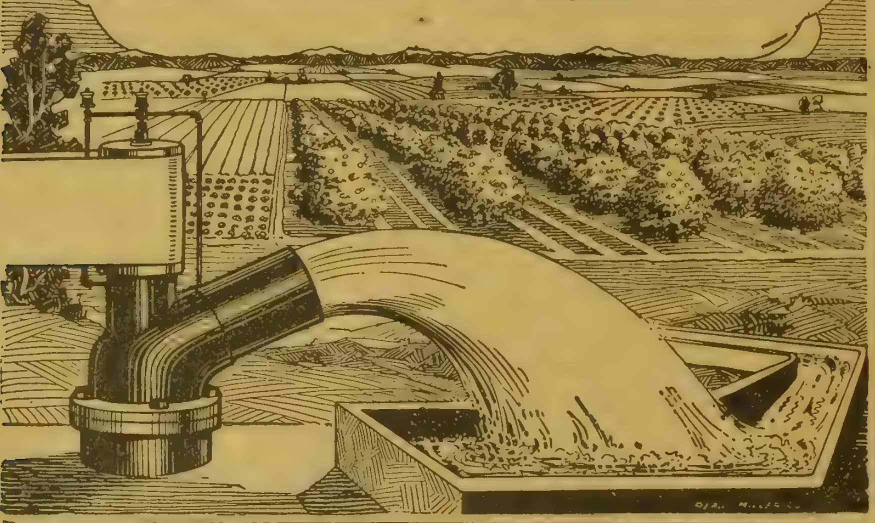
Water is produced at the very lowest cost.

Intricate mechanism and unnecessary parts are eliminated. No pit required. Compactly housed. Unaffected by sand. Built to pass inside of casing 9⅝ to 30 inches. There is a Layne & Bowler Pump to meet your particular requirements.

Everyone interested in irrigation should have our illustrated Catalog No. 30. It tells all about this pump. Write for it today.

Layne & Bowler Corporation

900-910 Santa Fe Avenue Los Angeles, California



COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrog en in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Small Fruits and Vegetables

THE GOOSEBERRY IN CALIFORNIA

Written for California Cultivator

By E. C. Hall

The gooseberry is so well known it will need no description in a short farm paper article. It is of rare worth for sauce and the making of pies and in jam has a flavor unsurpassed. How well we remember the gooseberry pies our mothers used to make in the east, recollected when many other things are forgotten. So much for tribute to the gooseberry.

The gooseberry's natural environment is a rather shaded place, or northern slope, and on land that is called seepy, or on sub-irrigated land, but it can be grown on almost any good soil, preferably a sandy loam, as it will admit of irrigation without baking and settling so much as is the case on heavy soils, gives ease in cultivating, quick returns from fertilizers and retains moisture well.

Do not get the idea, though, that because I said almost any soil I meant almost any climate; California has many localities, especially the interior valleys and most of the southern part of the state, where they cannot be profitably grown, but in many places along the coast and localities around San Francisco bay, where the fog and cool moist air and breezes reach, they are profitably grown, and I am told they do well in some parts of the Sierra foothills, but before planting on a large scale I would advise going slowly until one finds out whether his locality is suited to the profitable raising of gooseberries. Then after finding out whether the gooseberry will grow and bear well, the next step is to find the variety that will do best in that locality, for the best is none too good. Bear in mind in this connecton that some varieties do well in some localities, while others do better in some other places; so it is the same old story, one must try out varieties that do best in their particular locality.

Here in Greenfield, Monterey County, in the Salinas valley we have the cool, moist air direct from the ocean, which counteracts the heat, so that we only have a very few days in the growing season—that is the fruit season—that might hurt the berries, and as the berries ripen, or rather get ready for the market early in the season, they are very apt to be marketed before much hot weather comes. Taken all in all, we consider that we have an almost ideal location as to soil, climate and irrigation facilities for the growing of some varieties of gooseberries; and being midway between two large cties of the state, we enjoy an advantage of marketing.

Planting.

On our irrigated land we commenced planting six by eight feet apart, 48 square feet to each bush, but now consider six by six feet, or rather five by seven feet better, as that gives more room to drive through one way. It greatly facilitates cultivation to plant so as to cultivate in both directions.

I mark the land one way, then stretch a wire crosswise and plant in each mark, using number 14 wire. In place of furrowing or marking one way, the wire can be made in links as long as one wishes to plant the bushes apart, or a piece of solder put on wire will answer the same purpose; any good plan of orchard or berry setting is all right, provided the rows are run straight. Plant early, prepare land as soon after rains commence as possible. If rains are late, irrigate. One bush set in January is worth usually two set in March or April; when set in early January they will not start growing right away, that is leaf out, but they will be sendng out those little white rootlets that feed the plant, then when it comes time for the leaves to come out and top growth to begin, just see the bushes grow, providing land has been well fertilized and well prepared and has sufficient moisture.

Manner of Planting

Choose a time when the soil is in proper condition to work nicely, not wet but moist. If top dirt is dry, throw it aside, dig hole about a foot across, make small mound in center of bottom of hole, as in setting orchard trees. Have bushes in a tub or bucket of water, take bushes out and cut off all long and mangled roots (a really more agreeable time to cut roots is before being put in tub), set bush directly over small mound with roots evenly distributed around hole; the mound helps to start roots in a downward direction; without the mound some of the ends of the roots will point upward, and as the gooseberry is naturally shallow rooted it is essential to encourage it to send its roots as deep as possible. Place moist soil around roots. When hole is two-thirds full press soil firmly. I press soil firm or less firm with my foot, according to condition of soil, then fill balance of hole with loose, mellow earth. Be careful not to let any clods or dry earth come in contact with the roots, as clods will let in the air and dry out the roots. Then do not water as is practiced when trees and bushes are set late in spring. I have set thousands of bushes this way and lost a very few. In this year's setting I did not lose any and not one was given any water except what was on roots as I took bush from tub.

When leaves begin to appear, if ground is dry, the plants should be irrigated; they should be kept growing thriftily through the spring, say up to July 1, then they will go without water if they are kept well cultivated and free from weeds.

Cultivation

Cultivation should begin a year or more before planting. The soil if not full of humus and very rich should be covered with strawy manure and preferably plowed when moist; if plowed under dry it should be thoroughly soaked by irrigation. Then plant to beans or potatoes. I prefer beans, as they add nitrogen to the soil, then by plowing deep next season and putting it in garden condition you are ready for planting.

After planting run a small-tooth cultivator through, or any tool that will cultivate shallow, and keep this up frequently enough to keep soil mellow and free from weeds. Be careful not to run too close to bush with cultivator unless running very shallow. Cultivate after each rain storm; do not let ground bake after a rain. I want to lay stress on keeping weeds down and out, not part of them, but every one. Gooseberries will grow and bear berries, with little or no care, but to reach the best results and profitable ones, care must be the watchword. I said cultivate shallow, but once a year some time in early winter the soil should be loosened up deep or else a so-called plow sole will form. This loosening up can be done with any orchard tool that can be run between the rows, provided it has long narrow teeth or shovels, called chisel cultivator teeth. In small berry gardens an old-fashioned double shovel plow with narrow teeth is all right; on large plantations larger tools suitable to the work will suggest themselves to the planter. In spring after vegetation has well started go around each bush with a push hoe or shovel and remove every weed, but while bushes are small a common hoe is all right. That is about all the hoeing they will need during the season, as the bushes soon spread out and cover the ground so that weeds and grass will not come up directly around the bushes to amount to anything after bushes leaf out. Propagating, pruning, spraying and marketing is another story.

Varieties

Of varieties there are many, but scores that are of no benefit to us; only a few have proven profitable from a money standpoint. I will only mention the best of those I have tested and such as have been recommended for a climate such as ours.

American kinds. The Downing is a popular variety where it does well. It is a large pale green or almost white berry, fairly upright grower and very hardy; can get along with very little water besides the winter rainfall; grows readily from cuttings.

Houghton and Josselyn or Red Jacket are two very hardy berries, slightly oblong and red when ripe; very similar, but Josselyn is the better flavored, Houghton the best bearer; they are both of drooping habit and do not sunburn.

Oregon Champion, later than Downing, originated in Oregon, is a hardy, upright grower and very prolific, needs more water than Downing, as it bears such immense crops; will not do well where it gets very hot; as it bears so full it does not have leaves enough to cover all the berries. It requires a cool moist atmosphere and if a north hillside is procurable and some shade, all the better, but here in Salinas Valley we have it out in the open, no shade and no north slope, and it does well; one of the best, if not the best, berry that has been tested in Greenfield. Two neighbors each have gooseberries similar to Oregon Champion (they do not know the name of them), that do very well here. Plants are six and seven years old and bear from eight to eleven pounds each. Oregon Champion set in the spring, if properly taken care of, will bear enough next year to pay all expenses and keep coming year by year.

English Varieties. I have only tested two so far. The May Duke is hardy and free from mildew, rather a slow grower, berries pale red and very large, later than Downing; does not sunburn much; brings good price.

Keepsake, pale green berry and of a delicious flavor, bears well, half drooping habit and hardy, free from mildew.

Crown Bob and Whitesmith are two English sorts highly recommended. The Berkeley, so highly recommended for some localities, is worthless here, and so is the Golden sold through here a few years ago at a high price, but of no account here, as it does not bear well enough. I have tested some other American sorts that are not worthy of mention.

TOMATO WORMS

Dr. A. W. Morrill, entomologist of the University of Arizona agricultural experiment station, writes as follows regarding worms in tomatoes:

In addition to cotton and corn this worm attacks a number of vegetables, including tomatoes and beans. It also occasionally breeds upon alfalfa. It is usually advisable to avoid planting tomatoes in fields planted in corn the previous season. Plowing the field in the fall and winter breaks up the pupal cells which are located in the ground, and is one of the most effective measures of control against the insect. In dealing with small gardens it would not, of course, make any material difference whether food plants for the boll worm have been grown on the same ground the previous year, since the insects will undoubtedly come in from the outside unless the garden is extremely isolated. It seems that comparatively little attention has been given to the prevention of injury to tomatoes by the boll worm. It is possible that corn planted so that it would be in silk during the time when the tomatoes are making their most profitable crop would help to protect the tomatoes. The moths would prefer to lay their eggs upon the fresh corn silks rather than on the tomatoes, giving the latter the advantage. Spraying the tomato plants is also recommended. Arsenate of lead at the rate of one ounce of the powder or two ounces of the paste should be used in each gallon of water. The spray may be conveniently applied by means of a knapsack, compressed air, or bucket sprayer, provided in either case with a suitable extension rod and nozzle. A three-foot piece of rubber hose, a three-foot aluminum extension rod, and a nozzle which will throw a spray at right angles to the extension rod makes the most satisfactory equipment for whichever one of the three types of garden sprayers you select.

OKRA

Written for California Cultivator

By D. F. Reichard

Hibiscus esculentus, a native of Southern Asia and grown in the warmer sections of the temperate zone.

Warmth, moisture and frostless months are important in raising okra. The seed will not germinate if planted in cold ground. In Southern California it is not safe to sow the seed much before April 1st, while in the northern part of the state two to four weeks later is proper. Since it takes okra four to five months of continuous warm weather to mature one should know his local climatic condition before venturing any considerable planting.

Okra requires fairly rich sandy loam soil, thoroughly soaked and worked before putting in the seed, which should be sowed where the plants are to grow as the young plants do not transplant easily. Okra should be planted in rows four to five feet apart and one foot apart in the row. The seed is usually sown in drills and the small plants thinned out to the desired distances. After the thinning and the plants are established, if the ground is not of a moist nature, it should be irrigated every 10 days or two weeks and thoroughly cultivated after each irrigation.

The young tender seed pods are used in various ways in cooking. White Velvet is the variety most used, but where the season is somewhat short the Dwarf Green is planted because it matures a little quicker.

DON'T SUMMER PRUNE RASPBERRIES

The practice of summer pruning followed in the eastern states does not seem to be well adapted to this plant when grown in the northwest. The vines grow tall, often reaching a height of seven to nine feet, and if cut back in early summer, will branch and send out good strong limbs. If pruned a little later in the summer the tendency is to cause the vines to winter kill and suffer to such an extent that the crop is greatly lessened the following year.

Tests along this line at the state college of Washington indicate that the best returns will be obtained by giving thorough, clean cultivation and doing all of the pruning in the winter time. All of the summer pruning done has resulted in injury to the plants. Some growers report fair success with summer pruning, but the general indications are that summer pruning will result in injury to the plants, while in a very few cases it resulted in a definite benefit to the plants or to the crop produced.

Where summer pruning is done the best system is to cut off the top bud when the vines reach the height desired. This will cause them to send out lateral branches. If the work is done early enough and the latter part of the season is dry enough, the side branches will mature and suffer very little winter injury, but if the work is not done early and the land dried sufficiently to stop growth, winter injury will result. Some patches have been practically killed by the late summer pruning.—O. M. Morris, Horticulturist.

The vegetable garden soil will need frequent hoeings; all clods and lumps should be well broken down and the hoe kept going constantly. After a watering, as soon as the soil becomes firm, a good hoeing is the means of conserving most of the water that has been given.

If your garden failed to do well this year, and you are not quite sure as to the cause of its failure, the chances are that most of the trouble was in the preparation of the soil, prior to planting the seed.

Every Rancher should own a
Western Gas Engine

Write for Illustrated Catalog

Our large illustrated catalog goes into full details concerning this wonderful gas engine. It tells of the great saving made by using the **Western**. In the back of the catalog are several valuable tables, indispensable to the up-to-date rancher. This catalog is non-technical—anyone can understand every word of it. Sent to you free and postpaid. Write for it today.

S. J. SMITH

One of the oldest and best friends of the Cultivator and its readers has passed. S. J. Smith began business in Los Angeles manufacturing irrigation windmills about the time the California Cultivator began its existence. He used its columns to increase his sales. With the development of the gas engine he began handling that as a more satisfactory means of lifting irrigation water. The business of the company increased and it soon took the name of the S. J. Smith Machinery Company. A few years ago it was again enlarged and the concern became the Smith-Booth-Usher Company. A few months ago Mr. Smith disposed of the greater portion of his interests, though retaining sufficient stock to continue on the directorate. He then took up work with the Lambert Engine and Tractor Company, which concern began the construction at El Segundo of a large manufacturing plant for making tractors. Of this Mr. Smith was managing director. A few days ago an operation was performed at the Angelus hospital in the city of Los Angeles and he never rallied from the operation.

NEW SECRETARY

State Horticultural Commissioner Cook announces the appointment of E. J. Vosler, formerly assistant superintendent of the state insectary, to succeed E. O. Essig as secretary of the commission.

GOOD MONEY FOR WALNUTS

Before another issue of the Cultivator the walnut growers' association may have set the prices of the present season's output of walnuts. It is impossible to predict what the prices will be, for they will be more or less affected by war conditions. The whole situation is set out in an article written by Secretary Thorpe of the California Walnut Growers' Association and appearing on page 294 of this issue. European countries are holding everything in the nature of food, and it is reported that an embargo has been placed on the walnuts of France. But even had the embargo not been placed, it seems that it will be impossible for the nuts to be brought to the ports of shipment. So under these conditions California nuts will have practically the entire American market. If the embargo is lifted or shipping conditions improve, then France's product of practically 15,000 tons will come in competition with California's 9000 or at most 10,000 tons.

One feature of California's nuts this year is their exceptional quality. Last year's output was severely injured by the hot weather of late September. As the 1914 crop is already being gathered there is no possibility of injury to it.

BUY A BALE

The business men of St. Louis have started the movement to buy a bale of cotton and have written California commercial organizations urging support of the movement by taking subscriptions for bales of cotton. The California organizations, instead of supporting this movement to buy cotton from the southern growers, have decided, at least in one instance, that of the Los Angeles Chamber of Commerce, to encourage the buying so far as possible of Imperial Valley grown cotton.

Any one who may feel able to make a good investment in good property should write either the Los Angeles Chamber of Commerce or the Chamber of Commerce of the Imperial Valley at El Centro and send check for $50, which will buy one 500-pound bale of cotton at 10 cents per pound.

The surplus cotton of the United States amounts to about 3,000,000 bales. By surplus cotton we mean cotton which is shipped to foreign mills. This represents to cotton growers practically $150,000,000 at 10 cents per pound, the lack of which will bring untold suffering unless Americans who are able aid in financing the proposition. Let Californians increase the comfort of California cotton growers by buying a bale of cotton.

STATE FAIR

The Cultivator devotes considerable space to material regarding the state fair which closed in Sacramento last Saturday night. We are unable to give all the awards this week, but next week will continue them and give at least the awards in the swine classes. In the main the fair was exceptionally successful. The receipts were hardly up to last year's, though approaching them much more closely than anticipated the first day or two. Market conditions, together with the approaching expositions, perhaps influenced the attendance to a degree. The receipts last year were $48,112.20, with an additional $5500 from concessions. The total attendance was 101,000. Figures have not been tabulated this year, but it is thought the attendance will run somewhat under 100,000 and the total receipts in the neighborhood of $1000 or possibly $2000 under last year's, but as the expenses are lighter this year, the net receipts will be close to last year's, which were approximately $10,000 to the good after all expenses were paid.

The live stock parade was by long odds the finest ever made in California. There were more than 1000 head of stock in the Thursday parade, whose valuation by conservatives was in excess of a half million dollars.

It is presumed there will be no fair in 1915, that all the energies of the state will be centered on the great exposition. We say, presumably, though there is a possibility that nominally there must be a fair in order to comply with the law which stipulated that on a certain date a fair should be held every year thereafter.

There were many features at the fair deserving severe criticism, but that could hardly fail to be true of any great movement involving so many diverse interests. But we believe the management is honestly endeavoring to give to California what we have all appealed for many years, and that is a "for sure" agricultural fair which shall be representative of California's greatest industries.

FORTY-EIGHT VARIETIES.

Secretary of State Jordan has just completed the Forty-Eight Varieties, a 112-page book of extremely fine type giving text and argument for and against the proposed amendments to the constitution of the state and proposed statutes which will be voted upon by the electors of California on November 3. There are 48 separate measures. The first calls convention for the revision of the constitution. The second is an initiative amendment prohibiting the manufacture, sale, gift or transportation of intoxicating liquors. The third is the eight-hour law, and so on through the list. To simply name them would require more than a column in this paper.

We assume a copy of this book will be mailed to every voter in California, and we want to assure those who are readers of the Cultivator that they have no small task before them from now until election day to inform themselves on these measures. On the part of many there will be a temptation to ignore most of them. This will be a mistake, for every intelligent voter should inform himself fully and vote for or against every-one. So long as the initiative remains, the duty before us is to be worthy of the privilege, but from the great number of measures which have been passed up to the voters of California this year it is plain that some revision of the initiative and referendum is necessary. The percentage of voters required to place one of these measures on the ballot is altogether too small. Any legislation for which there is a crying need can secure enough signatures of voters if a much higher percentage than now is required and the state be freed from the necessity of considering so many measures sprung by faddists.

Agricultural News Notes

Shantung province in northeastern China is now raising cotton in considerable quantity.

The bean crop in Michigan is a week earlier than usual, and according to dealers is of better quality than usual.

A special committee of the Florida Citrus Exchange is considering the marketing of vegetables also the coming season.

$500 cash award is offered for the best district exhibit at the International Irrigation Congress, to be held at Calgary, Alberta, Canada, October 5 to 9.

Florida grapefruit will probably be ready for shipment the latter part of September. The total citrus shipments from that state for 1913-14 were 7,665,014 boxes.

Florida is strictly enforcing the acid test on grapefruit intended for shipment out of the state. Practically no fruit has yet been permitted to leave packing houses.

Approximately 3000 cars of wheat were tied up at Galveston, Texas, for several weeks on account of delay to export shipping by the outbreak of the European war.

The exports of Italian products to Argentine during 1913 were valued at $36,719,794. Cotton, wool and silk tissues, wine, olive oil, butter and cheese and paper and books are some of the principal articles shipped.

As a result of conferences among congressmen from nine cotton states, Senator Sheppard of Texas has sent requests to governors of those states to meet in Washington and discuss the question of curtailing next year's crop.

In addition to its work of carrying the troops, the Great Eastern Railway of England is converting its restaurant and kitchen cars into ambulances. The interior fittings are removed, and the interior arranged with ambulance materials, everything being done on the most approved principles.

It will be unlawful for any person, or association to ship between the states for the purposes of sale any seed or grain falsely labeled, or falsely represented as to grade, character or name, if a bill introduced by Representative William A. Cullop, of Indiana, becomes a law. The bill provides punishment by a fine of not less than $500 or by imprisonment for not more than one year.

An irrigation project covering more than 3,000,000 acres is located in Alberta, Canada. This is divided into three sections, one of which, some 83 miles from Calgary, now has installed 2500 miles of irrigating canals. Calgary will be the scene of the International Irrigation Congress, October 5 to 9. During the congress excursions free to delegates will be run to this great irrigation project.

Australian beef, which has gained in demand in the United States and especially in California of late, will be a scarce article within a short time because of the Australian government's announcement that exportation of foodstuffs to neutral and warring countries will be entirely stopped. Notification of the government's action has been made by Joseph Cook, prime minister, and it is assumed that Australia's beef, mutton, wheat and flour exports will go to England.

Agricultural News Notes of the Pacific Coast

Northern California

County Commissioner Stabler is making a campaign against Russian thistle.

Lodi shipped out 51 cars of Tokays Saturday. Prices are reported holding up well.

Prof. Lipman lectured before the San Joaquin County farm bureau at its last session.

Four hop kilns on the Horst ranch near Wheatland have been destroyed by fire. The cause is as yet a mystery.

Los Molinos hop ranch of Tehama County has completed hop picking. Much of the work was done by machine.

Sutter County's bean crop will be almost double that of any previous year. It is estimated at 12,500,00 pounds.

A total of 1700 cars of deciduous fruits is estimated as the season's shipments from Newcastle, Placer County.

Almond prices fixed by the Growers' Exchange are about two cents higher than those fixed the beginning of the season last year.

Penryn, Placer County, reports exceptionally heavy crop of olives some of which are already contracted for at $150 per ton.

W. S. Russell of Ottumwa, Iowa, has been appointed superintendent of the display and sales department of poultry at the Panama-Pacific Exposition.

The success of redwood sawdust packing for grapes has led fruit packers to try similar experiments with pears and plums, which have been equally successful.

Five hundred inmates of San Quentin are enrolled in the extension courses of the University of California. About half of these are taking agricultural courses.

The poultry show held in connection with the rice exposition at Gridley called out a large attendance of poultry fanciers. Nearly every class was well filled.

A very thorough campaign against pear blight has been conducted in Sacramento County by Horticultural Commissioner Kercheval. A tree to tree inspection has been made.

Judges for the California Apple Show to be held in San Francisco in October, are J. B. Olwell of Medford, Oregon, George E. Rowe of Grand Rapids, Michigan and Prof. C. I. Lewis of the Oregon experiment station.

A $400 prize for the cow yielding the highest average amount of butter fat at the Sacramento fair has been awarded to Gilbert Trigg, a Humboldt County dairyman; second place in the contest was also won by a Humboldt County cow.

At the last meeting of the Humboldt County dairymen's association much criticism was given to the proposed plan of sending boys from agricultural clubs on a trip to Washington, D. C. The point raised was that no one boy has accomplished enough to deserve such reward and that it is impossible excepting through favoritism to choose the candidates.

Central California

Kerman's alfalfa meal mill has begun grinding.

The price of cyanide has risen two cents more per pound.

Fresno District Fair will be held September 29-October 3.

Exeter expects to have a second cannery within a few months.

Rice culture on alkali lands of Kern County has proved a success.

An order for 100 tons of figs on a five-cent basis was recently received by a Fresno grower.

The Associated Raisin Company has asked growers not to deliver loose Muscatels until after October 1.

California's almond crop this year is estimated at 1700 tons. The association has fixed opening prices for the season.

Residents of the Terra Bella district of Tulare County are considering the establishment of a $1,000,000 irrigation district.

Onion growers of the Stockton district are much discouraged over the low prices of onions. Garlic, on the other hand, is selling high.

During the past week eastern concerns have placed orders in the Alta district of Tulare County for 100 tons of figs at a five-cent a pound rate.

The superintendent of the poultry department of the Fresno County fair to be held at Fresno September 29-October 3, expects an unusually fine exhibit.

Fresno County farmers are working to secure the appointment of a farm adviser. State Leader Crocheron has advised them that money is now available for two more county advisers for the state.

The California Wine Association has announced a $10 price to growers for grapes, none of this to be paid in cash. For each ton will be paid $5 in negotiable paper, bearing six per cent interest, and another five due April 1, 1915.

The annual meeting of the San Joaquin County farm bureau will be at the county court house at Stockton, October 24. Election of officers will be held. The bureau is discussing plans for securing tested alfalfa seed for its members.

The weather forecast service from the Fresno office to points in the San Joaquin Valley has been resumed. Where possible forecasts will be distributed over the telephone and special rain and frost warnings will be sent out in addition.

The California Farmers' Protective League held an enthusiastic meeting in Sacramento, Saturday, September 12. A regular plan of campaign was adopted and a director appointed to lead the work in the different counties. Arthur Dunn of Sacramento is secretary and manager of the league.

Fresno County growers are still pushing the proposition to send a $1,000,000 cargo of dried fruits and grain to Europe. It was stated in San Francisco recently that if the project went through California Britishers would pay for 1,000,000 cartons of raisins to be sent to England to be used as food for the soldiers.

Southern California

The walnut harvest is at its height in the Whittier district.

Walnut growers of the Hemet Valley are planning to organize.

Five hundred cotton pickers will be needed to handle the crop in the Palo Verde Valley.

Great preparations are making for Ventura's County fair to be held the last of the month.

Farm Adviser Parker of Ventura County held a pruning demonstration at Sespe recently.

Railroad officials estimate the bean crop of Santa Barbara and Ventura Counties at 1,250,000 sacks.

The first carload of walnuts is reported as shipped out from Capistrano, Orange County, September 10.

Bean growers and threshers of Orange County have compromised on a price of 27½ cents per 100 pounds for threshing.

Carpinteria, Santa Barbara County, reports its walnut yield light this year but of higher quality than ever before.

The Egyptian cotton growers of the Imperial Valley met at Coachella on the 9th. It was decided that growers would pay two cents a pound for picking.

Twenty registered Guernsey cows have just been received on the Dupee dairy farm at Santee, San Diego County. The car of Guernseys came from Massachusetts.

Lima bean growers of Santa Barbara and Ventura Counties are disappointed in their crop. The cool weather has promoted heavy vine growth, but pods are scarce.

The Covina Valley Farmers' Club held its first fall meeting Saturday, the 19, and was addressed by B. H. Crocheron who is in charge of the county farm adviser movement in this state.

The bean harvest of the Carpinteria Valley of Santa Barbara County usually precedes the walnut harvest but this year the bean vines are still growing while the walnut harvest is half over.

The department of agriculture, as the result of recent research work in the sugar beet fields of Southern California, will establish permanent headquarters in Los Angeles next spring. The work will be in charge of E. C. Rittue.

Representatives of the different associations of walnut growers met in Los Angeles on the 10th and talked over prices, but no decision was reached. The general estimate of the total crop was that it would be 75 per cent of average.

Twenty thousand young acacia trees will be set out by the Southern Pacific along its tracks between Santa Barbara and San Luis Obispo. These trees are used because of their value as soil binders in anchoring the shifting sands.

The San Antonio Fruit Exchange has elected the following directors for the coming year: Fred Smith, president; D. C. Crookshank, vice-president; Dr. Vincent Baker, Frank P. Firey, L. E. Loveland, C. T. Naftel, E. C. Robinson, W. O. Fritz and M. A. St. Clair, directors.

The Coast

Oregon reports estimate that state's output of potatoes at far below normal.

Red spider has done considerable damage to the hop yards of Western Oregon.

The Western Washington Fair will be held at Puyallup. September 29-October. 4

The long drouth in the Northwest has finally broken with some damage to hops and tomatoes.

A movement is on foot to organize farmers of Maricopa County, Arizona, to secure a county farm adviser.

At the agricultural fair at Wheeler, Oregon, a magnificent display was made of 2500 dahlia plants in one collection.

Grain growers of the Northwest are anxious to sell wheat at present prices but find it impossible to get sufficient transportation facilities.

This is the week of the Spokane Interstate Fair, and so many entries of cattle have been made that it is impossible to provide shelter for all.

Poultry raisers of the Salt River Valley of Arizona have plans made to ship a carload of Thanksgiving chickens to California and another just before Christmas.

The Oregon Jersey Cattle club offers $200 to that member whose cow wins over all breeds of dairy cattle at the Oregon state fair to be held at Salem, September 18-October 3.

Arizona district fairs are to be held as follows: Graham County, September 24-26; Northern Arizona, at Prescott, October 15-17; Willcox, October 29-31; MacNeal, November 26.

Prof. G. W. Barnes, live stock farm adviser of the Arizona agricultural college, is making a tour of the live stock sections of the state. Prof. Stanley F. Morse, adviser on soils, is also visiting farmers.

The Fourth Pacific International Live Stock Exposition will be held at the Portland Union Stock Yards, North Portland, Oregon, commencing Monday, December 7, 1914, and continuing until Saturday, December 14, 1914.

The Mesilla Valley Fruit and Vegetable Growers' Association of New Mexico this year made its first carload shipments. The horticultural department of the state college cooperated with the association in directing, grading and packing operations.

The Phoenix Vegetable Growers' Association was recently organized. Lettuce will be the principal vegetable grown for shipping the coming season. Ernest Hall of Phoenix has been elected president and V. A. Leak, secretary-treasurer. The association expects to market vegetables from the Phoenix, Glendale and Chandler districts.

Old Club Foot, the most ferocious bear that ever roamed the Gila River country in Arizona, has been captured. Six bullet holes were found in the hide, but none even penetrated the fat. The hide alone weighed 250 pounds. The government offered a bounty of $400 on Club Foot and a number of purses were also offered by cattlemen.

your farm stock on
Cottonseed Meal

and keep them in a healthy, sound condition. As a feed for cattle, COTTONSEED MEAL has no equal. It fattens and builds good sound flesh. When fed to chickens, hogs, sheep, horses and mules, the results are remarkable. Cottonseed Meal is the very heart of the cotton—the most nutritious part.

Recent experiments in Southern California and for many years in the South have proven Cottonseed Meal to be an excellent FERTILIZER when mixed with other products. Let us tell you more about COTTONSEED MEAL—an interesting booklet for the asking.

BUTTER SCORING CONTEST

The bi-monthly butter scoring contest being conducted by the university farm at Davis was this time staged at the state fair. We have not yet received Prof. Leon M. Davis' comment, but we have all scores over 90, which are as follows:

J. N. Jensen, Cooperative Creamery, Visalia	94½
Ed. Shina, Crystal Butter Company, Sacramento	94
Peter Petersen, Valley Flower Creamery, Ferndale	93½
E. Brain, Sierra Valley Creamery, Loyalton	93½
Anders Jensen, Castroville Creamery, Castroville	93½
Christian Christensen, Kern County, Bakersfield	93½
W. Paulson, Siskiyou Creamery, Greenview	93½
V. Baciarini, Suisun Creamery, Suisun	93
Hans Beck, Danish Creamery, Fresno	93
J. V. Canham, Manchester Creamery, Manchester	93
Nels. Jensen, Kern County Creamery, Bakersfield	93
P. M. Becker, Grizzly Bluff Creamery, Grizzly Bluff	92½
A. Bergland, Sacramento Valley Milk & I. C. Co., Sacramento	92½
Carl Overgaard, Sierra Creamery, Madera	92½
Julius Madsen, Capital Creamery, Ferndale	92½
Simon Koppes, Montague Creamery, Montague	92
W. H. Gilbert, Dairy Delivery Company, Gustine	92
Glenn Decow, Mission Creamery, Perris	92
Blake & Son, Los Molinos Creamery, Los Molinos	91½
H. A. Milenz, Silver Crest Creamery, Sacramento	91½
E. O'Mara, Cooperative Creamery, Heber	91½
Peter Petersen, Live Oak Creamery, Gilroy	91½
M. Willing, Keyes Creamery, Keyes	91½
J. C. Phillips, Delta Creamery, Imperial	91½
F. C. Hyde, Tulare Cooperative Creamery, Tulare	90

DAIRY PRODUCTS AT THE STATE FAIR

Each year the number of entries exhibited in the dairy products department at the state fair increases. This year there were 41 entries of creamery butter and 37 entries of cheese, besides the exhibits in the market milk and cream and the display classes. With the exception of one entry of butter and four of cheese, all exhibits came from California factories or dairies. As a whole the products exhibited made a very creditable showing. Much of the butter was of good quality, few criticisms for the more disagreeable quality defects being made. The influence of workmanship on the score of butter and cheese was never pointed out better than at this scoring. In the butter exhibits, for example, faulty body was general, some few entries suffering heavy cuts. The score card for one particular entry shows that the butter workers' score was cut down by four points because of mechanical defects. With a critical market such butter would be sold under a sacrifice of several cents per pound.

The display of the dairy products in the large glass refrigerator which occupies the center of the dairy building was very showy and attracted the attention of the hundreds of visitors. In the dairy building is also located the working creamery, operated by the dairy division of the university farm. Here a few hundred pounds of butter was manufactured daily. The creamery is well equipped to handle the product in a commercial way. Along with the creamery there was a cooling demonstration carried on. Different types of milk and cream coolers were set up and in operation, and it was shown not only how to cool milk and cream, but why such should be done. All of these features were of interest to practical dairymen and creamerymen.

MILKING CONTEST AT STATE FAIR

Much interest was taken in the milking contest conducted during the entire state fair. Only Jerseys and Holsteins entered into this contest, but of these there were nine entries. There were three milkings each day, at five a. m., one p. m. and nine p. m. Results were as follows:

Aged Cows

Miss Blany, 337.3 lbs. milk, 13.352 lbs. of butterfat; Co Bossie Buttergirl, 300 lbs. milk, 9.808 lbs. butterfat; Aggie Acme, 269.6 lbs. milk, 9.683 lbs. butterfat; the above all owned by Morris; Goldie of Venadera, Guy Miller, 214.7 lbs. milk, 9.521 lbs. butterfat; Salumera, Watson, 209 lbs. milk, 8.467 lbs. butterfat; Philadelphia Marigold, Odell, 194.9 lbs. milk, 8.078 lbs. butterfat; Golden Tiny, Hackett, 180.3 lbs. milk, 7.316 lbs. butterfat; Marie's Lady, Hayworth, 144.1 lbs. milk, 6.056 lbs. butterfat.

Over 30 Months, Under Four Years

Queen Segis of Norwood, Hatch, 315.7 lbs. milk, 8.980 lbs. butterfat; Salome of Mossdale, Thorpe, 176.85 lbs. milk, 7.559 lbs. butterfat; Marie's Carnival, Hayworth, 166.6 lbs. milk, 7.503 lbs. butterfat.

Under 30 Months

Colossie K. Queen DeKol, Morris, 227.5 lbs. milk, 6.933 lbs. butterfat; Gladys of Venadera, Miller, 112.1 lbs. milk, 6.710 lbs. butterfat; Sweet Tips, Thorpe, 96.4 lbs. milk, 5.203 butterfat; Requeza, Watson, 101.4 lbs. milk, 5.048 butterfat.

CALIFORNIA HORSE BREEDERS

Members of the California Draft Horse Breeders' Association met in Sacramento during the recent state fair and discussed ways and means of increasing membership and interest in the association and in the industry of draft horse breeding. The association has been formed for some time, but the membership has been very small, notwithstanding many have been appealed to through circulars. Yet draft horses continue in great demand, and Pacific Coast users of such stock have been compelled to appeal to the east for a sufficient number to do our work. Means of securing new members were discussed at the meeting, and some thought one obstacle was the fee of five dollars heretofore charged for membership. After general discussion this was reduced to one dollar, and it was resolved that every horse breeder in the state should be appealed to to lend his influence to the association.

One suggestion to increase the interest in draft horses was the work horse parade, similar to that at one time held in San Francisco, and those frequently held in the larger cities of the east. Several expressed the opinion that during the exposition next year the greatest parade of horses ever made on the coast should be made, and in any case this association would be called upon to act as host to many visitors who will come purely because of the exhibits of draft horses which will be made. A committee consisting of the president, Professor True and Mr. Bassett was appointed to have charge of a campaign for securing members and to suggest means of increasing interest in the industry.

In addition to the work horse parade, a horse sale in various communities of the state was suggested. Such a movement would probably be supported by all stallion owners exclusively for sale of their stock, or it could be made general. First steps were taken toward having a general sale at the next annual meeting,

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

BLACK LEG
LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen, because they protect where other vaccines fail. Write for booklet and testimonials.
10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Cutter's Blackleg Pill Injector 1.50
Discounts: 250 doses, 10 p. ct.; 500 doses, 20 p. ct.
Use any injector, but Cutter's simplest and strongest.
Every package dated, unused pills exchangeable for fresh after date on package. Do not use old vaccine (ours or any other), as it affords less protection than fresh.
Insist on Cutter's. If unobtainable, order direct.
Send check or M. O., we pay charges and ship promptly.
THE CUTTER LABORATORY, Berkeley, California.

KENDALL'S SPAVIN CURE
The old reliable remedy you can depend on for Spavin, Curb, Splint, Ringbone or lameness. Thousands have proved it invaluable. Get a bottle from your druggist. Price per bottle $1. 6 for $5. "Treatise on the Horse" Free at druggist or from Dr. B. J. KENDALL CO., Enosburg Falls, Vt., U. S. A.

which, of course, will be held in San Francisco during the live stock exhibits. Henry Wheatley of Napa is president of the association and Professor J. I. Thompson of the university farm, Davis, is secretary and treasurer. The directors for the present year are E. W. Westgate, Rio Vista; Gordon H. True, Davis, and Dr. I. B. Dalziel, San Francisco.

RABIES

There is always so much excitement in a community where a rabid dog appears, or when anyone is bitten by a dog which is supposed to be mad, that many foolish things are done, and oftimes the case is so complicated that it is difficult to arrive at a correct diagnosis at any later time.

For instance, a man was bitten by a common house dog and pulled out a big six shooter and blew out the brains of the animal, rendering a certain diagnosis impossible.

No supposedly rabid dog should be killed if it is possible to confine him where he will not be a menace to the community. If the dog lives a week after biting a person, he was not rabid. This in itself is sufficient to make a person feel safe. If, however, the dog dies some days later after showing symptoms of rabies, then an examination of the brain by a competent pathologist is the only method of making a reliable diagnosis.

The head should be removed from the body, packed in ice for sending away. It is not feasible to attempt to remove the brain because of the danger of fatal inoculation from injury to the hands.—I. E. Newsom, Colorado Agricultural College.

GROW MORE BEEF

It seems that we may profitably grow more beef and pork when we consider that James Walker, farmer, of Scottville, Illinois, sold at Chicago, August 19, 1914, five cars of cattle (80 head) for $11,784.15, of which 47 steers averaging 1475 pounds, brought $10.60 per 100 pounds, or $154.45 per head, while 26 steers averaging 1378 pounds, brought $10.50 per 100 pounds, or $144.70 per head. These are the highest prices he ever received for such stock. Mr. Walker is 81 years old and has fed cattle and hogs for the Chicago market continuously for 52 years. Within this period he has sold the best cattle as low as $3.75 per 100 pounds and the best hogs at $2.50, and has seen corn selling at eight cents per bushel such as now brings eighty cents.

HANDLING SILAGE

One of the best bulletins we have seen on the handling of silage is No. 145 of the University of Nebraska. It has to do with almost everything from harvesting corn in the field to cutting, elevating and delivering to the stock. Anyone interested in pit silos should surely get it because it gives the most complete exposition of that method of handling we have seen.

INTERESTING TO DAIRYMEN

Conventions of especial interest to dairymen during the next few weeks will be the State Fair next week, at which dairy tests will have particular interest; the Fresno District Fair, beginning October 1; the Dairy Show at Modesto, October 14-15, and a public sale of registered Holsteins at Hanford, October 28th.

Cows will not give a steady, good flow of milk if they are worried by flies. They will get nervous and cause a lot of trouble. Here is a first-rate spray that can be used with great benefit: Fish oil, two quarts; kerosene, one quart; crude carbolic acid, one pint; oil of pennyroyal, one ounce; oil of tar, 10 ounces. Mix thoroughly and apply in a fine spray, every two or three days, or as often as the flies begin their attacks.

One of the main laws that underlie the breeding of good, healthy stock is maturity.

Be sure that your head saves your heels in farm work.

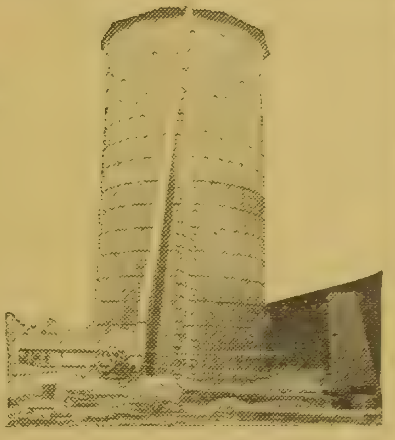
Increased Separator Efficiency

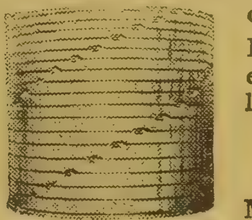
The best cream separators often fall below expectation simply because they are not properly lubricated. The separator is your most delicate farm machine. It demands an oil especially made to suit it.

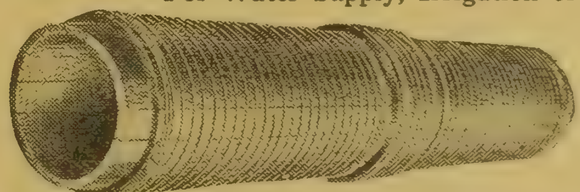
Standard Hand Separator Oil

is just such an oil. It is made for separators and it is of just the right body to quickly reach those finely adjusted, close fitting bearings. It protects them from wear. It enables your separator to deliver *all* the butter fat. It eliminates unnecessary repairs and lengthens the life of your machine. There is no better oil made for your separator. Ask your dealer for it.

Standard Oil Company
(California)







SILOS
All sizes and dimensions made to order for your particular conditions.
This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.

TANKS
From 500 to 500,000 gallons capacity.
Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE
Machine Banded or Continuous Stave.

WEANING PIGS

Written for California Cultivator

By Sacramento Valley Contributor

When should pigs be weaned? Is it a good plan to let the sows or the pigs do the weaning or should the pigs be separated from the sows? And at what age should the pigs be taken away from the sows?

These are questions that every thinking hog raiser must ask himself every time a litter of pigs gets past four weeks old.

The Cultivator would be glad to print the experiences and opinions of hog growers on this subject.

Ranchers
Dairymen
Fruit Growers
and Investors

ARE you looking for the BEST—absolutely THE BEST—conditions to be found in all California? Nothing like it anywhere in all the State. Read and reflect—then write us for further information and details.

WATER—Abundant and good GRAVITY irrigating and domestic water, ALL you want—WHEN you want it—AS you want it—ANY hour of day in the year at lowest possible cost (only the up-keep of ditches), averaging about 38c per acre per year. One-half miner's inch (about six acre feet) with every acre, from your own canal, with perpetual water right for every acre you buy.

SOIL—The richest, loamy, easily worked soil, containing abundant lime and phosphates, producing enormous crops of alfalfa, grains, fruits and vegetables. (We just cut 28 acres of alfalfa, yielding 132 tons, over 4½ tons per acre, at one cutting.) Level lands, but with enough grade to irrigate easily, that can be cleared and prepared for crops at low cost.

STOCK-RAISING—The fine quality of the alfalfa and grasses grown here, favorable climate, pure water, with mountain range for summer feed, guarantee to the stock raiser that perfection only obtained under most favorable conditions, and warrant the high prices that are obtained for Owens Valley grown cattle, hogs, horses and other stock. Hundreds of head of cattle are fattened here for market annually.

DAIRYING—Dairying in any country has long been recognized as a money-making occupation. Owens Valley, being exceptionally favored in the matter of bright, dry climate, pure water and fine feed, offers opportunities to the dairyman which few communities can boast. Before many years Owens Valley will be one of the banner dairying valleys of this State.

GOOD NEIGHBORS — Good Schools and Churches and Solid Banking Facilities and Positively the VERY BEST bona-fide Land Proposition in the State. Reasonable prices and terms.

BEST of bank and business references on request. We will demonstrate every statement to your satisfaction. You cannot afford to overlook this limited offer (only 55 forty-acre tracts in all), which is the new subdivision of one of the banner ranches of this State. Just placed on the market by responsible owners. Write, phone or call for further information and illustrated printed matter.

Owens Valley Land and Water Co.
G. M. Rea, Secretary,
Suite 630 H. W. Hellman Bldg.
Los Angeles, Cal.

As it appears to us the proposition is one of circumstances and conditions. If it is necessary to get as many pigs as possible from the sows in as short a time as possible, and plenty of skimmilk or buttermilk is available, along with soaked or new grain, alfalfa and refuse from the table, it is all right to wean pigs at six to eight weeks. If the feed ration is limited, and not too well suited to young pigs, they will make greater gains and mature more quickly if they are not weaned until 8 to 10 or even 12 weeks old. In the latter case the gain put on by the pigs getting their mother's milk, in addition to such feed as they may rustle, will undoubtedly amount to more value in dollars and cents than the gain in having the sows farrow a month or two earlier.

To grow the most pork for the time and feed expended should be the aim of every hog raiser. This makes it necessary to carry pigs from birth to maturity without shrink or setback. This makes it necessary to have the young pigs eating well and thriving before they are deprived of their mother's milk. They should be castrated at three or four weeks, so as to have this chance for shrinking over with while they will hardly notice it and while they are yet nursing.

In the hot weather in the interior valleys of California it is quite as important to have a clean mud "wallow" for young pigs as for older hogs, and at weaning time it is particularly important that they have this and shade and all of the other comforts.

Unless pigs have access to alfalfa in abundance so that there is no possible danger of constipation, it is well to pay especial attention to the condition of the bowels of young pigs at weaning time. An addition of a little oil meal to the ration helps to correct any tendency toward an irregular, feverish state.

Care and attention and the interest of a man who is a true stock grower and has the welfare of his charges deeply at heart count for more than all the rules or suggestions, however, and explain why pigs "do well" for one and not so well for another when all of the other conditions, except this care, are much the same.

Legal

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Attachment of Stock

What is the proper procedure for attachment and sale of stock, the stock still being on pasture? — Subscriber, Wasco.

An attachment may be issued in the following manner: A complaint is filed, together with such bond of two sureties as a court may require; writ of attachment issued and delivered to constable, who in the case of stock would then take the stock into his possession and hold same to await the outcome of the suit, requiring the plaintiff in the action to indemnify him for the expense of feed and care.

Stock Killed in Pasture

A takes stock to pasture upon rented pasture. The stock trespass habitually upon adjacent unfenced land. One falls into an old well and is killed. Is A responsible for loss of animal?—Subscriber, Wasco.

Under the bare facts stated, it would come directly within the rule of recent supreme court case holding that the owner of the pasture is responsible for the loss of the animal.

Safety of Depositors

In case of bank failure has a depositor any insurance against loss? Is a national bank any safer than other banks? Is a savings account the same as a checking account so far as safety is concerned?—Subscriber, Thermal.

There is in this state no insurance of bank depositors. The history of bank failures has been that fewer national banks have failed than state banks. The stockholders of a national bank in case of failure may be required to pay in for the benefit of creditors an amount equal to the par value of the stock which they hold. There is no discrimination with respect to savings and checking accounts. Savings banks may invest their funds only in high grade securities, producing comparatively low interest, and cannot take the risk of loaning upon commercial paper; in so far they are safer than commercial banks.

E. A. Bridgford, exhibitor of a fine string of saddle horses.

Manager of De Laval exhibit ready to talk separators.

J. G. Stahl coming up a stretch during the parade.

C. G. Hines and R. V. Moore, judges of poultry and pigeon classes.

The judge of the hogs was a typical farmer and thorough going judge.

Prof. J. I. Thompson of the university farm, judging one of the horse classes, talking to V. F. Dolcini.

Who Pays?

A bought 10 acres of land and with it 10 shares of water stock in an incorporated pumping plant. A set trees, and before they were irrigated the pump broke, taking five days to repair. It was hot and A hired B to haul water to save the trees. Who should pay B for his work, A or the water company? — Subscriber, Alta Loma.

If it was not for the fact that when A became a stockholder of the water company he thereby assented to its articles of incorporation and by-laws, he could very probably require such company to repay him for the money expended to B, but it is undoubtedly true that the water company safeguards itself in its by-laws in respect to just such contingencies.

Lathrop; 3, Junior heifer calf, E. E. Johnson; 4, Primrose of Alta Vista; 5, Mayhew Blossom. Guernsey aged herd—1, W. H. Saylor; 2, one entry, C. G. Lathrop; 3, one entry, A. B. Humphrey; —1, Get of Imp. Lord Kitchener, C. G. Lathrop; 2, Get of Gastletten, W. H. Eaylor; 3, Dr. J. W. Henderson. Produce of dam—1, C. G. Lathrop; 2, Produce of Trisdalette, W. H. Saylor; 3, Dr. J. W. Henderson; 4, Produce of Imp. Glen of Mono Marchie, C. G. Lathrop.

Dutch Belted

All awards to Mr. and Mrs. U. G. Strader.

Bees and Their Care

CONTAINER LAW

As a number of beekeepers have inquired as to the present status of the container we quote from the Western Honey Bee the correspondence of Mr. Blakeman, a California honey producer, with United States Attorney Schoonover. We first give Mr. Blakeman's letter which states the case, then Mr. Schoonover's reply:

"The federal act now in force, but whose penalties become effective September 3 next, which requires labels or stamps upon cans, bottles or parcels of food for human consumption, is perhaps not fully understood by shippers of honey and producers thereof who ship mostly by carload lots from this valley.

"We ship our honey in cases resembling very closely cases of coal oil, and, like them, containing two cans of five gallons each, and usually sold by weight. Will you kindly answer the following questions:

"Must each can bear a stamp or label, to be shipped interstate, or would such mark on the box do?

"Must the stamp or label give the net weight and also the word 'honey'?

"Can the producer avoid responsibility by selling here cases and cans of honey to be shipped in bulk by the carload, and would a penalty attach to the producer who filled the cans?

"Would a certificate of purity accompanying an unmarked shipment, fulfil the requirements of the law?"

* * *

"I have delayed answering your letter of the 2nd inst. until I could procure a copy of 'Regulations' of the secretary of the treasury, secretary of agriculture and secretary of commerce, adopted May 11, 1914, for marketing the quantity of food in package form.

"Your letter requests answer to the following questions:

"(1) Must each can bear a stamp or label in order to be shipped interstate, or would such mark on the box do?

"The answer to this is found in paragraph (a) of the regulation, of which a copy is enclosed, and which provides (except as otherwise provided by this regulation), that the quantity of the contents in all cases of food, if in package form, must be plainly and conspicuously marked, in terms of weight, measure or numerical count, on the outside of the covering or container usually delivered to consumers. The final consumer of your honey would receive the same, of course, in the can and not in the box, so the stamp or label must be put upon each can in order to be shipped interstate.

"(a) Except as otherwise provided by this resolution, the quantity of the contents, in all cases of food, if in package form, must be plainly and conspicuously marked, in terms of weight, measure, or numerical count, on the outside of the covering or container usually delivered to consumers.

"(2) Must the stamp or label give the net weight and also bear the name 'honey'?"

"The net weight must be given, as said paragraph (a) provides that the 'quantity of the contents, in all cases of food,' must be marked as provided. The label must also bear the name 'honey.'

"(3) Can a producer avoid responsibility by selling here unmarked cases or cans to be shipped in bulk by the carload, or would a penalty attach to the producer who filled the cans?

"The provisions of the regulation, copy of which is enclosed to you, become a part of the food and drugs act of June 30, 1906, and section 2 of that act reads in part as follows: 'And any person who shall ship or deliver for shipment . . . or offer to deliver to any other person, any such article so adulterated or misbranded within the meaning of this act . . . shall be guilty of a misdemeanor and for such offense shall be fined not exceeding $200 for the first offense; and upon conviction, for each subsequent offense not exceeding $300, or by imprisonment not exceeding one year, or both, in the discretion of the court?

"'Misbranding, within the meaning of the act,' would no doubt include failure to label the packages as required by the act.'

"In answer to your last question: 'Would a certificate of purity accompanying an unmarked shipment fulfil the requirements of the law?' will say that I know of no provisions by which such certificate would operate to avoid the necessity of labeling the packages of honey in the manner provided by these regulations of May 11, 1914."

* * *

The Western Honey Bee summarizes under the following points:

In case the United States pure food law is violated, the net container law of California becomes practically nonexistent. The offender is punished solely by the federal court, under United States law.

Illustration: The thief who violates California law by stealing from the post a money letter, goes before the United States judge—California laws are silent.

A purchaser after buying honey of a California producer may afterwards conclude to send it out of the state. The United States courts might rule that the said producer is liable for any subsequently discovered irregularities.

A few minutes' inspection of package foods in a grocery will show how to mark your honey cans, besides it will show how all other producers lead the honey men in obeying this beneficent law.

I find little trouble in putting just 60 pounds in every can.

Since March 3, 1913, we have violated this act every time our shipments have gone east. The penalties have been deferred by provision of the act itself until after September 3, 1914. How much longer time will suffice to end this neglect?

The net price of the A, B, C and X, Y, Z of Bee Culture (revised edition) is now $2.00. The Cultivator will be pleased to secure this excellent book for its readers at this price or in connection with a year's subscription to the Cultivator (either new or renewal) for $2.90 postpaid.

Tire Attacks

Which Goodyears are Best Fitted to Resist

The Fiercest Four

These are the four chief tire troubles:

Rim-Cuts Loose Treads
Blow-Outs Punctures

Note, for your own sake, how Goodyears meet them in ways exclusive to these tires.

Rim-cuts are impossible in Goodyear No-Rim-Cut tires. We control the way—the only feasible way—to prevent it.

Blow-outs—most of them—occur in weak spots, due to wrinkled fabric. We remove this cause by our "On-Air" cure, which no one else employs.

Loose treads are combated by a patent method, which creates in each tire hundreds of large rubber rivets.

Punctures and skidding are best met by our exclusive All-Weather tread. It is tough and double-thick. The grips are deep, sharp, resistless.

Yet the tread—flat and regular—runs as smoothly as plain treads.

No tire ever built offers one of these features save the Goodyear No-Rim-Cut tire.

It's Up to You

These things mean safety, strength, endurance. They mean maximum mileage and minimum trouble.

Getting them depends on you, for any dealer will supply you Goodyear tires. And at less than usual tire prices because of our mammoth output.

Countless men do get them, and tell other men to get them. More men now buy Goodyears than buy any other tire.

Please remember these things when you next buy tires. Don't trust to luck. Don't think that tires are much alike.

The only way to save tire troubles is to buy tires that combat them.

Albany, Ore., Jan. 7-10, 1915, E. Schoel, secretary, Albany.

Tacoma, Wash., Dec. 29-Jan. 2, 1915, J. A. Caddey, secretary.

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

COULSON COMPANY
Petaluma, California

WAR XTRA!

WAR! WAR! WAR! War to extermination is being waged right here in our Sunny California against lice and mites, by those powerful allies —Devil Dust and Lee's Lice Killer, and MORE WAR is being waged against disease of all kinds by that King of all poultry remedies—Germozone, and STILL MORE WAR is being waged against roup by that Peerless Remedy—Acme Roup Cure. But after all war comes—PEACE—and peace will come to you and success and contentment will be assured if you will use the triple entente of the food world—Peerless Scratch Food, Standard Egg Food, Lee's Egg Maker.

Insist on Having
French's Poultry Mustard
Sold in Sealed Packages Only

French's Poultry Mustard is a scientifically manufactured article containing the flours of different mustard seeds so blended to produce the greatest strength in the volatile principle that is desired, and is required to produce the fortunate results arrived at by the users.

Germain Seed & Plant Co.
326 So. Main Street, Los Angeles

A teaspoonful to six to twelve fowls fed daily in dry or wet mash. Booklet for the asking.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Feeding Value of Barley Bran

What is the feeding value of barley bran or hulls? I ground some barley fine and find by sifting a large portion of coarse bran. — Subscriber, Lakeside.

We think the hulls referred to have very little feeding value. In the poultry yard they would make excellent material in which to scatter grain for the hens to scratch in and if there is any food value the poultry will find it.

Orchard Trees Dying.

I enclose leaves and twig from plum, pear and cherry trees affected with some disease. Some of the trees have died, others are more or less affected. Most of the trees are healthy looking. The orchard was affected last year and the trees were sprayed, but did not spray this year.—Subscriber, Hughson.

The leaves show practically no fungus or other trouble, or at least not sufficient to cause death or serious injury to the tree. We take it the cause of the trouble is at the root, or at least some physical condition which the leaf does not show, other than that they were taken from unhealthy trees. In such a case we would ask a great many questions of the soil. Some of the leaves, especially those of the plums, have slightly the appearance of "little leaf."

Application of Bordeaux Paste.

In your issue of August 6 I have read with interest Mr. H. S. Fawcett's article on treatment of gummosis on citrus trees. I would like to ask if no other treatment of wounds is given after the application of the Bordeaux paste, also I would like to ask the best time of year for making such treatments. Can it be done during the fall and winter, when there is more time for such work?—D. M. E., Rialto.

Mr. Fawcett answers: "In regard to application of Bordeaux paste, I would say that when these wounds are of some size so that the wood is exposed to drying out and cracking, one of the best and cheapest coverings for this exposed wood is asphalt paint, the kind in which benzine has been used, not turpentine. This should be applied to the exposed wood only after the cut edges have begun to show new tissue indicating that the disease is cured, and should not be used to any extent on the live bark, although it will not materially injure the bark if it is allowed to get on the edges of it. This should not be used at the time of treatment for gummosis, but some time afterward, or say in the fall before the winter rains begin.

Stick Tight Fleas

I have been rubbing chickens' heads with warm lard and coal oil to rid them of stick tight fleas, and also sprinkled the runs with boiling water. I find that they still have them and would like to know of some dip, something that won't hurt the eyes. —Subscriber, Owensmouth.

No dip into which a bird could safely be put would be strong enough to kill these pests. Corrosive sublimate is the surest remedy, and that must be handled very carefully, for it is a deadly poison. You can get corrosive sublimate, diluted with alcohol, at any drug store, and apply it with an old tooth brush to any fleas you see on the heads or bodies of the chickens. It will kill the fleas instantly, but you must be very careful not to get it into the eyes or mouths of the birds or into your own. Of course the fleas will not stay off the chickens unless you get them out of the yards, and for this purpose strong salt water, used boiling hot, is better than the hot water alone. Use enough of it to wet house and yard thoroughly, and then hose the yards daily for several days so that the salt will soak well into the soil. In spraying the house see that you get into all the dark, dusty corners. If you have not whitewashed recently a good coat of whitewash will help to keep the house clean.

Feeding Barley to Poultry.

In feeding barley that is not well bearded to chickens does any harm result?—Subscriber, Lakeside.

A chicken's digestive apparatus can take care of almost anything small enough to go into the crop, but there is no nourishment in barley beards, and I see no reason why they should not cause impacted crop if they are eaten in sufficient quantities. If you will soak the barley 12 hours and then drain it 24 hours before feeding, and then as you feed take the trouble to crush it in the hands as you throw out each handful, you will find that most of the beards are broken off and what is left is so soft it can do no harm. Fowls do not like dry barley very well at the best and it should be made as palatable as possible.—J. A. K.

Potatoes for Planting

Where can I obtain potatoes for planting that are free from disease? —Subscriber, Fallbrook.

It would be hard to say where such potatoes could be secured, for there is no section where potatoes are produced commercially in any large quantity but that some form of trouble has appeared. The best procedure would be to secure seed as clean as possible, from a reliable grower, and insist upon having a certificate of inspection from the county horticultural commissioner or his deputy. Then in order to prevent scab as much as possible dip in corrosive sublimate or formaldehyde solution—two ounces of the corrosive sublimate in 15 gallons of water, or one ounce formalin in two gallons of water.

Eye Trouble

I have a chicken, the fourth this fall, with one eye swollen quite large. Chickens roost in the open air and have free run. They are R. I. Reds. Is it contagious and what can be done for it?—Subscriber, Gridley.

If you examine your chicken's eye I suspect you will find that a "sticker" or some bit of dry weed has lodged in it. At this season when every weed is dry chickens that have free range are quite likely to get into such trouble. The only thing to do is to remove the foreign substance and bathe the eye twice a day with a boric acid solution (one-half teaspoon boric acid to a cup of warm water) or witchhazel (one teaspoon to a cup of water). Whether you find anything in the eye or not, bathing with the boric solution will probably effect a cure.—J. A. K.

Bermuda in Lawn

We have a nice lawn of blue grass and clover. Have recently found a patch of Bermuda grass about 12 feet square growing in the lawn. Can you tell me how to exterminate the Bermuda grass?—Subscriber, Modesto.

We once had a lawn in which Bermuda got started. As we desired to keep it absolutely free from the pest, the sod for a depth of about three inches was cut off and taken away. The rest of the soil was screened to a depth of about six inches. The lawn was not a large one and this work was done at odd times, but it finally appeared that it would be almost an endless task. However, it succeeded; every spear of Bermuda roots was removed. If there is none other in this lawn than the small patch referred to, this procedure might be advisable. Raking the surface with a short garden rake—and keeping it up—tearing up the roots as much as possible, using putty knife or square pointed blade to cut out roots will keep down the pest, if the fight is persistently made. Always put in pinch of blue grass seed where weeds are killed out. But as the writer grows older he has decided not only to endure, but to have a certain affection for Bermuda grass. In this way we believe we can be much happier, for it is a never-ending fight to keep it entirely out of a blue grass lawn. We frequently have request for some chemical which will destroy Bermuda. There is none which will not at the same time destroy the more desirable plant, and the worst of the chemical proposition is that it destroys the soil as well as the plant, at least for a short time.

Wanted—Pullets—All ages and varieties, and laying hens for spot cash. Write us what you have, giving number, age and average weight. Pioneer Hatchery, 112 East 8th, Los Angeles, Cal.

BETTER LIGHT FROM KEROSENE
TEN Days FREE Send No MONEY
Beats Electric or Gasoline

You Can Prove Our Claims Without Sending a Cent

We don't ask you to pay us anything until you have used this wonderful new modern incandescent light in your home for 10 days, putting it to every possible test and then if you don't say that it is the greatest oil light that you have ever seen, or you are not thoroughly satisfied, you may send it back at our expense. You can't lose a penny. We want you to prove for yourself, as thousands upon thousands of others have, that the Aladdin has no equal; that it makes the ordinary oil lamp look like a candle; that it saves one-half on oil; that it beats electric, gasoline or acetylene; lights and is put out like old style oil lamp; burns common kerosene (coal oil) without odor, smoke or noise; is clean, won't explode, guaranteed.

We Will Give $1000.00 to any person who shows us an oil lamp equal to the new Aladdin (details of this reward offer given in our circular which will be sent you). Would we dare make such a strong challenge if there was any question about the superiority of the Aladdin over all other oil lamps?

Get One FREE We want one user in each locality to advertise the Aladdin. To that person we have a special introductory offer under which the one lamp is **given free.** Drop us a postal and we will give full particulars about this **unequaled offer on an unequaled light** and our **10 Day Free Trial.**

We Want Men With Rigs or Autos to Deliver the Aladdin on our easy plan. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before, writes: "I sold 51 lamps the first seven days." Another says: "I disposed of 34 lamps out of 31 calls." Thousands of others who are coining money endorse the Aladdin just as strongly.

No money required. We furnish capital to reliable men to get started. Ask for our distributor's plan, and learn how to make big money in unoccupied territory.

MANTLE LAMP COMPANY, 61 Aladdin Building, Portland, Ore.
Largest Manufacturers and Distributors of Kerosene Mantle Lamps in the World.

Saves Money— Makes Money!

You must be interested in these advantages of the remarkable "Steel King Plow." Does the work better, cheaper, and much more quickly.

STEEL KING MOTOR PLOW

Easy to drive, flexible as a motor car. Gets into all the close corners. Walks right along with plow, disc, harrow, seeder—

And it can also be used for sawing, pumping, running a silo—in fact, the Steel King is an all around farm machine.

1 man operates it
-does work of 8 horses
-at fuel cost of only 8c per acre!

Think what this means in your work. Can you afford to do your work by old-time methods when this splendid machine can be secured for $1050, f. o. b. Los Angeles? Write today for complete information—you need the Steel King NOW! A card will do.

MAKIN' JELL.

I kind o' love these lazy-feelin' days
When Summer's gettin' dreamified and slow,
And fallin' into little whimmy ways
Becuz she's packin' up her duds to go,
But wonders if she hadn't better wait
Till Autumn comes and peeks inside the gate.

I love the mixed-up flavorin's that fly
About the door-yard, every which-a-way—
Of berry vines a-bakin' brown and dry,
And yeller sugar-cantaloupes, and hay,
And scenty weeds; and I do love the smell
Of b'ilin' grapes, when Susan's makin' jell.

It's jest this time o' Summer every year
That Susan takes for jam and jell and such,
When Concord grapes are plump and full and clear,
But still before they've ripened very much—
They ain't got purple yit, but every one
Is like a gold-red jewel in the sun.

They're best right then, she says, for makin' jell,
And when she's got the kitchen fire jest so,
She sets 'em on and lets 'em cook a spell—
Not b'ilin' hard, but gentle-like and slow,
Till all around the house and yard the air
Is full of grapey sweetness, everywhere.

That's when I love to set here, closte outside
The kitchen door, and smoke my corncob pipe
And watch the sky, so big and blue and wide,
And sniff the scent of things a gittin' ripe,
And listen to the "z-i-zz" of bumble bees
Among the velverettes and flower-peas.

And what I love the best of all's to know
Inside the kitchen, spandy-neat and clean,
That's Susan there, a steppin' to and fro—
Es chipper es a girl of seventeen—
And jest es sweet and pretty, seems to me,
Right now, es any girl I ever see.

It shorely is a dandy time o' year,
When Summer's sort o' flirtin' with the Fall,
And yit, I reckon that I wouldn't keer
A shuck for scenty weeds and fruit and all—
Ain't hardly anything I'd like es well,
If Susan wasn't 'round a-makin' jell.

—Harriet Whitney Durbin.

THE ROD OF GOLD.

Once upon a time an old woman, who had been walking through the wood, came at last to the open country beyond. Just before her flowed a stream which she must cross on her way. She seemed feeble, and, when the bank of the river was reached, she stopped in dread; for the current was swift and the stones were slippery and unsafe. She glanced about her at the trees, for she must have help. A great oak stood near with its beautiful leaves and many acorns. "Kind oak," said the old woman, "may I have part of one of your branches to make a rod to help me over the stream?"

"Indeed, no," cried the oak. "I cannot spare a single branch. My acorns are far too beautiful to give away."

Then the old woman went to a red maple near the oak, and said, "Will you be kind to me and spare me a branch from which I may make a staff to carry me over the river?"

"Of course not," said the maple. "Could you imagine I would spare any of my beautiful red leaves?"

The old woman turned sadly away. A chestnut tree stood near, and she appealed to it. "Good chestnut, may I have one of your branches?" she asked. But the chestnut tree could not spare a single nut, and so refused.

The sycamore thought her balls to pretty to part with, and the poplar stood tall and disagreeable and would not help her.

The elm drooped languidly, and told her she might ask the walnut. And so it went; hickory, ash, horse-chestnut, and birch tree all said, "No," till the poor woman, quite discouraged and tired out, sank on a great stone to rest and decide what was best to be done.

At her feet lay a stick, old and discolored, but straight and strong. It spoke to the old woman and said, "I'm sorry the beautiful trees have been so unkind to you, and I will help you gladly if I may. You see I have no beauty; I do not even know to what tree I belong; I have no acorns nor nuts nor leaves, and even my bark is gone; but I am strong, and will gladly take you over the stream."

The old woman picked up the poor rod at her feet, and, leaning heavily upon it, started on her journey across the river. The water roared about them, but the rod bore her in safety to the other side. When the farther bank was reached, a wonderful thing happened. The long cloak worn by the old woman fell away, and there she stood, not really an old woman at all, but a beautiful fairy. "I am the fairy of the woods, kind rod," she said. "I came to see if my trees were kind as well as beautiful. You have done all in your power for a feeble old woman. Now what can I do for you?"

The rod replied, "I should like to be beautiful, but most of all I want to be loved, especially by the children."

"You shall have your wish," said the fairy. "You are worth your weight in gold, but the rod of gold would not be loved by the little ones. I will give to you fairy gold instead."

She planted the rod in the earth, and it at once became green. From it grew beautiful leaves and many stems, and over all the fairy scattered millions of tiny stars of fairy gold till the top of the plant looked like sunshine. "Hereafter you shall be called 'Goldenrod,'" said the fairy, "and every one shall love you."

What the fairy has said has come to pass. The lovely goldenrod has been showing her yellow stars in our meadows ever since that day.—Sophia Brown, in "Christian Intelligencer."

CANNING WITHOUT SUGAR

If the price of sugar is prohibitive one may can peaches so that they will keep indefinitely by using plain water instead of syrup. The following recipe may be used:

Remove the skins from peaches by immersing in boiling water for about one minute, and then dipping in cold water. Place whole peaches in glass jars or tins and fill jars with hot water. Place rubber and top in place and sterilize for 15 minutes in hot-water-bath outfits, 12 minutes in water seal, 10 minutes at 5 pounds steam pressure, or 5 minutes at 10 pounds steam pressure.

Of course, the peaches when removed from the jar will not taste so sweet as those canned in syrup. However, if sweetening is desired, it may be added when the fruit is to be eaten.

This same method is good for canning with syrups containing varying amounts of sugar. A very thin syrup may be used if the housewife does not wish to dispense entirely with the sugar.

Apples may also be canned (for apple sauce, pie filling, etc.) using plain

water instead of a sugar syrup. Department specialists have repeatedly canned them by this method. In the case of apples, jars should be sterilized 16 minutes in hot-water-bath outfits, 12 minutes in water-seal, 10 minutes under 5 pounds of steam and 4 minutes under 10 pounds of steam."

TWO NEW ONES

Baked Oranges

Scrub clean with brush as many oranges as you wish to serve. Cut off top, loosen flesh from rind by running sharp knife around. Place in baking pan with water half way up on the oranges. Let boil until skins can be pierced with fork. Then place a teaspoon or tablespoon of sugar in each, according to acidity, and a bit of butter. Bake till slightly browned. Serve hot with meat, or cold. Pour over a sauce made by boiling down liquor in pan, thickened slightly, if preferred, with corn starch.

When you read this over you will probably say, as I did, "It doesn't sound good to me." But just try it. The fruit isn't sticky sweet like marmalade, but has a delightfully fresh taste, and the pungent flavor from the rind gives a delicious flavor.

Baked Bananas With Cheese

Make cut through top of banana the length of the fruit; press in a strip of cheese as long as the banana and a quarter of an inch thick. Place in baking pan and bake 10 or 15 minutes. Serve hot. Salt and lemon juice added at the table is considered an addition by some. These are good for breakfast, luncheon or dinner, also delicious at a weinie roast or over a camp fire.

Corned Beef and Cabbage Salad.

Take ½ head good firm white cabbage, 1 small can corn beef and 3 stalks white celery. Chop all very fine. Moisten with a good mayonnaise diluted with ½ cup thin or canned cream.

I use Durkee's salad dressing and dilute it with canned cream until I have the proper quantity.—Mrs. Chas. C. Bell, Artesia.

THE DRAIN BOARD.

Many housekeepers prefer zinc covered drain boards and kitchen tables to wood, porcelain or stone composition. The zinc is cheap, wears forever, is not injured by hot vessels and is easily cleaned. It may not be so attractive as porcelain or stone, but it is intensely practical.

WICKER FURNITURE.

Wicker furniture is so beautiful—some of it—so light to handle and so entirely suitable for California homes the year around that it is gratifying to see its steady growth in popularity. It is now made for use in every room in the home and finished in browns, greens, grays, cream and white to match any color scheme..

A famous lotion of colonial days, known as "morning days," consisted of of glycerine, half a teaspoon of borax one ounce of rosewater, half an ounce and three drops of benzoin. The quantities may be multiplied in a greater amount if needed. The lotion is applied to the chapped face made rough from wind or exposure with a bit of old linen.

The careful keeping of table linen will mean more toward a perfect table than perhaps the quality of the linen itself. The most exquisite table linen will look no better than the poorest quality if it be thrown into a too small drawer or closet.

Women owe it to themselves—it is as much a duty as that they owe their children—to care for their health and for their everyday appearance in cleanliness and neatness of dress.

If silver is rubbed up every day with a dry flannel rag it will not have to be cleaned with silver polish oftener than once a month.

We should devote our energy and talent to the solution of the problems of our own locality.

The Future Mother

The young bride who is about to face the problems of housekeeping will find in Ghirardelli's Ground Chocolate, a wholesome and economical food-drink. Start housekeeping right by serving this nutritious beverage. It will make any meal taste better and will keep the health in perfect condition. Costs less than a cent a cup. For making desserts and candy it is without an equal. Tell your grocer to send you a can.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

Good cooking made easy!

Good cooking depends as much on the range as on your skill. A cheap range or worn out stove makes cooking uncertain; and often spoils your best efforts.

Is that fair to you, or to your family, whose health and good humor are effected by what you serve?

The Majestic makes good cooking easy and sure. Made of charcoal iron and malleable iron; it stands rust and wear three times as long as ranges made of ordinary range metals. Put together with cold-rivets that keep the joints absolutely tight always, (no putty used.) Lined with extra heavy pure asbestos that holds in the heat and reflects it onto oven. Scientifically designed to maintain uniform temperature with least use of fuel; and to circulate heat evenly to all parts of oven. You never have to "turn the baking" in a Majestic.

[The 15 gallon all copper reservoir heats water as quickly as a kettle on a stove top; oven door lowers onto heavy braces; oven rack stays level, under load, when pulled out. Reservoirs flush with stove top have aluminum lids.]

The cost of a Majestic, in **service**, is less than that of any ordinary range. The fuel, repairs and work it saves and the **years** longer that it lasts, more than offset its little extra cost.

If you realized how much the Majestic reduces the work and worry of cooking, you would get one now. Find out! If you don't know the Majestic dealer near you, ask us. (There is one in every county of 40 States). Write for "Range Comparison" explaining the many Majestic points of superiority.

HAY

Under date of September 19 Scott, Magner & Miller say:

Receipts for the past week were 3987 tons, approximately the same as the previous week. Although receipts for the past two weeks have not been as heavy as for several weeks preceding, the market has been so heavily stocked for sometime that the decrease has not been noticed. Demand is very light. Large consignments continue to arrive.

The majority of the receipts continue to be of the medium and poorer grades, although the past week has seen quite a little fancy hay, which has sold readily. Demand for alfalfa is light. Large offerings of this commodity are in evidence, but few lots are changing hands. No change in straw. We quote the average wholesale prices on carload lots on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	8.00@9.00

WEATHER CONDITIONS

For week ending Sept. 19, 1914.

Citrus Fruit Market

LOS ANGELES, September 23, 1914.

It is certainly strange what will affect marketing conditions. Last week sales of oranges in the city of New York dropped from 30 cars to seven. The explanation is given that this was largely due to certain Jewish religious observances, which were general in certain quarters of the city. In addition there are immense receipts of deciduous fruits, amongst which is a 12,000 barrel shipment of Almeria grapes.

There are approximately 40,000 boxes of lemons coming weekly from the Mediterranean section. However, high-grade Californias are selling in the New York market at fair prices.

Shipments.

Shipments of oranges to date since November 1, 1914, 36,651 cars; lemons, 2,713; total, 39,364. To same date last season, oranges, 13,155 cars; lemons, 2,140; total, 15,295. Total of all citrus fruits two years ago this date, 34,465 cars.

NEW YORK, Sept. 21.—Seven cars Valencias sold. Market slightly easier. Weather fair.

PIPE PIPE PIPE

Last chance to buy Aqueduct pipe. Prices reduced to close out this month the small amount left. Over 150,000 feet sold in last 4 months. This is good, clean pipe—used only for clean water purposes along the famous Aqueduct. Just as good as new pipe—and price very much less. Prompt shipments to any railroad station. Mail or phone your orders immediately, as this opportunity will not last. AQUEDUCT PIPE CO., 1327 West 7th, Los Angeles. Phone Wilshire 1315. Sizes left: I-inch, 2-inch, 3¼-inch, 3½-inch.—Adv.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Kick on Hock

Have cow which was kicked on hock some time ago, causing an abscess to form. This was opened by a veterinarian, but has since refused to heal. How should it be handled so as to cause the open wound to heal over?—Subscriber, Hynes.

Apply a little nitric acid to the parts that will not heal. This will form a scab. When it heals and drops off it may be necessary to touch it again. Be careful in using the nitric acid, as it is a powerful caustic. Apply it to the wound with a small swab and do not get it on your hands or clothing.

Lice on Goats

A friend of mine owns 1500 Angora goats and asks me to write to you in regard to treatment for lice, or whatever it is, that infests them. He is experienced in dipping cattle and sheep and has dipped these goats twice, the first time in sheep dip, and a month later in soap-kerosene emulsion. Neither had any effect. I suggested the possibility of fresh broods hatching and he replied that the old ones were not killed, but were lively just after dipping. — Subscriber, Ontario.

You did not give the name of your sheep dip, but we think that if you would dip them in a two per cent solution of Zenoleum and repeat the dipping in a week you would get rid of any lice. It may be ticks that are infesting the goats. In that case it might be necessary to make the solution a little stronger.

Herpes or Nettle Rash

My four-year-old horse is suffering from an attack of itch or mange I suppose. It commenced last April by little lumps raising on the skin and itching terribly. The lumps had some pus or moisture of some kind in them. The trouble was worse on the sides of neck and shoulders. A few lumps appeared from time to time. The horse has been treated twice by rubbing on lard, sulphur and kerosene mixed. The neck, shoulders and head are still very bad. He also breathes heavily in hot weather and I thought he had a tendency to the heaves. Can you give remedy?—Subscriber, Hemet.

Those cases of irritation of the skin which are accompanied by slight eruptions are given various names, as the above. The trouble seems to be caused by the condition of the blood. Get one-half ounce of Barbadoes aloes, one-half pound epsom salts, and one-fourth pound of common salt. Dissolve all in a quart of hot water and when cool give at one dose as a drench. Follow this by giving powdered gentian, four ounces and bicarbonate of soda, six ounces. Mix and divide into 15 powders. Give one powder every night. To stop the irritation bathe the parts with cold water that has dissolved in it four ounces of borax to the gallon.

Milk Fistula

I have a cow that has two holes about in the middle of the two back teats. One spatters so it bothers when milking. How can they be treated so they will heal while she is dry?—Subscriber, Murrietta.

You will find the answer to this question in the Cultivator of August 20 on page 187 under the heading, "Milk Fistula." The operation will be the same on a cow as on a goat.

Lice or Mange

I have a horse afflicted with what those who seem to know call mange. His chief symptom is itchiness and consequent scratching to such an extent that he has rubbed off his mane and much of his tail, beside causing raw places on his back. I have applied diluted "Kreso Dip," which is apparently one of the numerous coal tar disinfectants. It seemed to temporarily allay the trouble but the irritation returns. Can you tell me what to do to cure the affection? What animals are likely to catch it and by what means?—Subscriber, Riverside.

The application of sheep dip should have been repeated as often as once a week for four or five weeks so as to be sure to catch the young as the sheep dip does not affect the eggs. If that fails, get one gallon of a thin engine oil and one pint of oil of tar. Mix them thoroughly and apply to the irritated parts twice a week. Rub it in well. Horses or cattle might get the trouble by the mites being transferred from one animal to another by rubbing against the same post, but frequently one animal will be bothered with lice or mange for some time before others of the same herd get them.

Swollen Sheath.

Will you please inform me through the Cultivator what is the cause of a horse's sheath swelling and what is the remedy? He is clean but poor in flesh and cannot eat his feed well. —Subscriber, Exeter.

There are many causes for the sheath swelling. The best remedy is as follows: Nitrate of potash six ounces, soda bicarbonate three ounces and powdered gentian two ounces. Mix and make into fifteen powders and give one every night. Also have the teeth fixed by a veterinarian.

Worms

My horse has not been doing well for six months. He has a good appetite at all times. I feed him the best of oat hay and four quarts of rolled barley mixed with two quarts of alfalfa and molasses at each meal, but he continues to be very thin and can not stand much work although I have worked him nearly every day. He has formed the habit of carrying his tail to one side and slightly raised. I also notice a milky white substance about the rectum. He also rubs his tail. Can you tell me the trouble and what to do?—Subscriber, Yucaipa.

The white substance about the rectum and the rubbing of the tail indicate the presence of worms. Probably the horse has both stomach and pin worms. You are overfeeding the horse and that alone will cause the kind of indigestion that will keep him thin in flesh and furnish the best of material for the worms to thrive on. First reduce the grain feed one half and do not give over one pound of hay to each 100 pounds of horse every 24 hours. Sometimes worms are hard to start, but be persistent and they will leave. Get the following: Powdered gentian four ounces, powdered nux vomica three ounces, bicarbonate of soda six ounces, sulphate of iron three ounces and farina eight ounces. Mix and give a tablespoon twice a day, and every five or six days give a pint of raw linseed oil with two ounces of turpentine in it. For the pin worms, use a decoction of tobacco as an enema. Use tobacco stems or any leaf tobacco and put about six or eight ounces in two gallons of water. Boil it for 20 minutes and when cool strain and inject all into the rectum. Make the horse retain it as long as you can. Repeat this in one week.

Lack of Milk flow

Two cows that recently came fresh are not doing well. They are in good flesh and so far as I can see are in good health but are not giving near the milk they should. They are increasing slowly, but I fear will never do what they should. One of them had milk fever last year, so I gave her an extra dose of salts this year; two and one half pounds the night before she freshened and one pound the following night. Was that too much? They are running on alfalfa pasture and have alfalfa hay night and morning. Can you suggest a remedy?—Subscriber, Turlock.

Your doses of salts were rather large; half the amount would have been enough. The lack of milk secretion would indicate a sluggish condition of all the secreting organs. Try the following tonic and we would be glad to hear the result: Powdered nux vomica eight ounces, powdered gentian eight ounces, bicarbonate of soda 12 ounces, and farina 12 ounces. Mix and give a tablespoon morning and evening in a little feed. Occasionally animals will not eat feed that has medicine in it. In that case put the dose in a long neck bottle, add a cup of water and give as a drench.

ZENO

The Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

the road to better farming

Through this booklet lies the easiest and most economical road to better farming.

If you are raising fruit, grain, rice, alfalfa, hops, beans, grapes or any other crop, you are anxious to discover a means of making your work easier and your profits larger. We know a way—this booklet tells what it is.

THE YUBA BALL TREAD TRACTOR

Two years ago the first Yuba Ball Tread Tractor was built and put into operation. It made good. Others followed. These machines are owned by scientific farmers—careful business men who invest in, rather than buy, farm equipment.

In their hands, the tractors have been thoroughly tested at every kind of work. The results of these tests have proved that the road to better farming runs through the pages of this booklet.

For the sake of convenience, here is the coupon.

Every Farmer Should Be Posted On This Wonderful New Forage Crop

200 ACRE FIELD OF SUDAN GRASS AT MATURITY
GROWN BY E. J. COWART,
LUBBOCK, TEXAS

AFTER CUTTING,
HARVESTED 1½ TONS
PER ACRE

SUDAN GRASS

Chief of all hay products—bigger, better and more certain in yield than any other forage crop.

Sudan Grass has been grown successfully wherever tried. Thrives in any soil—whether rainfall is ample or limited. Resists drouth—for dry and semi-arid sections it is the ideal crop. It obtains luxurious growth when other crops need moisture—yet does not blight where rainfall is excessive.

Sudan Grass is finer in growth and more leafy than sorghum—produces more and better hay than millet—has no root stocks like Johnson grass. It can not become a pest or infest the land.

It yields an average of 400 lbs. seed to the acre, and from one to two tons of hay from each cutting. Can be cut three or four times a season—every thirty days brings up a new crop from the stubble. An acre will produce four to six tons hay every year.

Sudan Grass makes a splendid feed for stock, whether cured or as ensilage. Stock relish it, preferring it to any other hay. It exceeds timothy in nutritive value. It will save you from buying feed because

A Sudan Grass Crop Can't Fail

Be sure you get the proper seed—pure *Sudan Grass.* Many adulterations are being offered for sale. You can only protect yourself by buying seed that has been carefully grown, gathered, cleaned and packed under strictest supervision. This means seed supplied by the Lubbock Sudan Grass Seed Association.

Read the following statement by Mr. B. Youngblood, Director, Texas Experiment Station:—"We took special pains to organize a local experiment "station at Lubbock, and have a considerable acreage planted there, as we "felt that the Texas plain country would be one of the best producing centers "in the U. S."

Lubbock Sudan Grass Seed is absolutely pure and thoroughly reliable. It has been grown under the supervision of the Lubbock County Experiment Station, V. L. Cory, Supt., and every field has been officially inspected, certified to and passed before harvesting. Quality always assured.

Put up in 1-2-5-10-25-50 and 100 lb. packages. Retail prices delivered:

1-10 lbs.	$1.00	per lb.
11-25 "	.95	"
26-50 "	.90	"
Excess of 50 lbs.	.85	"

FREE SAMPLE OF SUDAN GRASS SEED
Lubbock Sudan Grass Seed Association
Lubbock, Texas

FREE Sample Package and Booklet on request.

The booklet tells the story of *Sudan Grass.* Gives expert directions how it should be sown, grown and harvested to produce best results. Every stockman and farmer in the country should post himself on this wonderful forage. It means money.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIII No. 14 LOS ANGELES: THURSDAY, OCTOBER 1, 1914 One Dollar Yearly

California — "Terrestrial Paradise"

A State of Great Accomplishments; A State of Greater Future; A State of Greatest Beauty and Attractiveness and Filled With Admirers and Lovers Who Have Devoted One Day, October One, 1914 to Enumerating and Praising and Boosting California's Wonderful Opportunities.

HISTORICAL NOTE.—California was named by Spanish discoverers from a fabulous island described in a Spanish romance as "on the right hand of the Indies * * * very near to the Terrestrial Paradise." The territory now constituting the state of California was first visited by white men in 1542, when Juan Cabrillo, a Portuguese navigator in the service of Spain, explored the coast and islands in the Santa Barbara region and probably sailed as far north as Monterey Bay. In 1579 Sir Francis Drake sailed along the coast and landed, supposedly at Drake's Bay, a few miles northwest of San Francisco. He named the country New Albion and took possession in the name of Elizabeth of England. The English did not occupy the region, however, and the first settlement was made by the Spaniards in 1769 when the Franciscan Fathers founded a mission at San Diego. In 1776 the Mission Dolores was established where San Francisco now stands.

California was under Spanish rule until 1822, when, on the successful termination of the Mexican Revolution, it declared its independence of Spain and its allegiance to the newly established Mexican government.

For several years prior to 1846 large numbers of immigrants from the United States had been arriving in California, and in June of that year a revolt against Mexico was begun by the American settlers. The Mexican war was already in progress, and during July and August, 1846, the American flag was raised at Monterey, San Francisco, Sonoma, Sacramento, San Jose, San Juan Bautista, San Diego, Santa Barbara, San Pedro and Los Angeles. The final surrender of the Mexican forces to those of the United States took place in January, 1847. In February, 1848, by the treaty of Guadalupe Hidalgo, the Mexican claims to California and to territory north of the Gila and Rio Grande were ceded to the United States.

From 1846 to 1849 California was under military and provisional rule by the United States. In October, 1849, a state constitution was adopted by a convention held at Monterey; in the following month it was ratified by the people, and state officers were elected. On September 9, 1850, California became a state of the Union.

The total area of California is 99,617,280 acres, of which nearly one-half belongs to the federal government. Only 27,931,444 acres are in farms and less than half of this is in the class termed "improved land in farms," hence the general campaign of advertising to secure settlers who shall make the lands of the state more productive. This campaign has been conducted since the discovery of gold, and during recent years with more persistence. There have been times when farmers have questioned the advisability of such a campaign. They have said, "What other business in the world is asked to urge others with capital to enter into the same line and compete with it?" To such we would say that the conditions are hardly the same. Take, for instance, the citrus industry of this state. It has become a wonderful success because of its magnitude. Were there only half as many orange and lemon growers, there would not be sufficient funds to secure the perfect organization which now enables them to market under best possible conditions. To market any product successfully it must be produced in quantity sufficient to make a suitable market at any period of the year. The grower of the specialty who stands alone also stands alone in making his market. He may succeed wonderfully; more often he fails.

PICTURESQUE, BUT NOT SO OFTEN SEEN IN CALIFORNIA AS IN FORMER YEARS

The great ranges have given way and the more profitable fruit industry has largely taken their place.

A center has been formed in the state of New York, given up almost exclusively to Holstein breeding. It would be perfectly human for one dairyman in that section to say, "All my neighbors are producing Holsteins. I will raise another breed." The moment he does that he loses the force of the advertising which that section has carried on, for now it is well known the world over that most excellent strains of Holsteins may be had there. The same is true of the Guernsey in Wisconsin, and true of other stock in other sections.

Other features of agriculture the world over prove this contention. Is it not wise, then, that we should encourage every possible extension of our fruit growing, cattle raising, swine husbandry and other agricultural industries? Instead of having less than 28 per cent of our land in farms, and only 40 per cent of this farming land highly improved, let us increase it so far as possible. We may then secure better transportation and marketing facilities. As before stated, much of this land is in the hands of the government, and always will be, partly because of reservations, mainly because it is not tillable land. The greater proportion of the lands which are worthy of highest cultivation have been taken up. Extension of railroads and development of irrigation waters will place yet other thousands on the market, but for the poor man such ventures are not possible except through cooperation in a large way.

In addition, the loss of social and educational advantages in thinly settled sections calls for the offering of every encouragement to the settler.

As to quality of the settler who has sought California, the world has offered its best and it has been accepted. Society, schools and churches of California are the finest in the world. But why is the trend more largely to the cities? California's increase in population in the decade, 1900-'10, was 60.1 per cent, while the increase of the rural portion during the same decade was 34.5 per cent. Compared with the entire United States, there is still much room for congratulation, for the increase in population the country over was 21 per cent.

But now, with the best of roads, trolley lines going into the richest valleys, and best of rural social conditions, is not California in a position to show the world a reversal of the usual cityward trend?

The question will be answered affirmatively, I believe, only when to California's wonderfully productive soils and matchless climatic, social and educational advantages is added one other thing, and that is greater commercial advantage. The farmer has been encouraged to be a farmer and to remain a farmer that he might be "farmed" by urban interests.

"Produce more that we may live cheaper," is the cry. "We shall produce better and demand fairer treatment by the large interests in control of the markets of the country and a fairer share of the consumer's cost of bread and butter," is the answer. When that demand is met, I say, then will the attractiveness of the country claim its own and Rural California grow faster than Urban California. The demand will never be granted by the urbanite, however, until it becomes more insistent, and it becomes more insistent as the farmer gains in intelligence and as he grasps that wonderfully effective weapon, "cooperation."

Again, may I be permitted just a word of warning—not a knock—for the newcomer. I grant that some farmers are farming too extensively, and not enough intensively. Therefore shortage of capital and equipment prevents best results. But don't take the intensively small farmed idea too seriously. There has been suffering because of smooth agents preaching great profits from little land. Intensive cultivation means extensive knowledge and experience. Unless you have these don't throw up a salaried position and attempt the making of a living from an acre or two acres or four acres of even California soil. Read Dean Thos. F. Hunt's advice to settlers.

PANAMA-PACIFIC, THE WORLD'S GREATEST EXPOSITION

Two great expositions are to be held in one state. In this our state is unique—is Californian.

You Can't Overwork the Electric Motor

This threshing outfit on the ranch of the Portland Cement Co., at Cement, California, consists of a little Giant No. 1 thresher, driven by a G-E Motor. It is operating the thresher at a constant speed saving both grain and money. You can't overwork, tire out or fag a

G-E ELECTRIC MOTOR For RANCH AND FARM

The electric motor is the ranchman's most faithful power servant—more reliable than any other form of power and, in the end, a great deal cheaper. There is no expense for repairs or replacements. The only cost is the current and that's getting cheaper and cheaper every day.

Threshing, baling, mixing concrete, sawing cord wood, pumping for irrigation, clipping horses and sheep—in these and a hundred ways the G-E Motor has proven its greater efficiency and economy for ranch operation.

Write today for illustrated booklets about ranching with electricity--they are free.

Citrus and Tropical Fruits

THE CITRUS INDUSTRY

From less than 1,000,000 boxes of citrus fruits produced in 1890 the output of California has increased until this year it will be approximately 19,000,000 boxes, in carloads about 46,000, or, as we have before expressed it, not far from one carload every ten minutes, day and night, Sundays and all holidays, from one year's end to the other. The industry brings to California between $30,000,000 and $40,000,000 and is the greatest asset of any one of California's productive resources.

CITRUS FRUITS BRING MILLIONS
Millions in money, and really millions of people, over the boundaries of California.

There is invested in the citrus industry not far from $200,000,000 by 10,000 individual growers, and 100,000 people depend upon it for a livelihood. To produce this immense tonnage trees are planted on 200,000 acres. This industry has called into existence the greatest cooperative marketing organization in the world. It handles nearly 65 per cent of the citrus fruit of the state.

The greater proportion of it comes from some four or five of the southern counties, yet the Central California section is increasing its production with wonderful rapidity and its early fruit supplies most of the holiday trade. One peculiarity of the citrus industry is its wide range, for the fruits are produced from the extreme southern to almost the extreme northern limits of the state. This is proof of the wonderful blessing California has in her matchless climate.

THE OLIVE AND ITS OIL

The oldest fruit industry of California is that of the olive. At the San Diego Mission the first trees were planted in 1769, and from that point the industry has spread until there is scarcely a county in the state today which is not growing the olive. There are now in excess of a million and a half trees in the state. Florida has some 8,000 trees, Arizona a small number at the present time, but the industry there is rapidly developing. Besides these, three other states in the Union have less than 200 trees.

As an indication of the possibilities for growth of this industry, the United States in 1913 imported 3,946,076 gallons of olives and 5,840,357 gallons of olive oil. The annual value of the Mediterranean output is $8,000,000 less than it was 50 years ago. The number of bearing trees in California in 1912 was 612,804, non-bearing trees 85,911. Our yearly production is about 750,000 gallons of pickles and 250,000 to 300,000 gallons of oil.

The industry has increased wonderfully since the passage of the pure-food bill and prices have advanced until as high as $250 per ton has been paid for extra fine pickling fruit. However, the general price ranges from $100 to $150, while the price for oil olives is from $50 to $100.

SEMI-TROPICALS

Besides the citrus and the olive, California has a wonderful range of productions in fruits which do not grow in the other parts of the United States. Perhaps the one having the greatest promise at this time is the avocado. However, there are, among others, loquat, pomegranate, persimmon, cherimoya, mango, feijoa, sapota and guava.

Bean Turbine Pump

For Deep Well Work

Install a Bean Turbine Pump and your water problem is solved. It does the work when other types of pumps would be useless.

AUTOMATICALLY WATER-BALANCED, a feature every pump owner will appreciate.

PLENTY OF BEARINGS — they are placed every five feet. This insures perfect alignment and makes possible highest speed and greatest efficiency.

LINE SHAFT IS CENTRAL TO PUMP — entirely outside of discharge pipes and never comes in contact with water. No sand or grit can get in the bearings.

THREE PIPE DISCHARGE—the pipes being simply and securely bound together. This means strength, yet sufficient flexibility to insure satisfactory work in wells that are not perfectly straight.

DIRECT CONNECTED TO MOTOR—if desired.

Send for further information if you're interested in deep well pumps.

BEAN SPRAY PUMP CO.

FEDERAL AID TO CALIFORNIA AGRICULTURE

The Federal department of agriculture has been kind to California. It has not given all we have asked, yet as a rule every request for aid which has shown the need to be great has been responded to favorably.

U. S. Experts. Usually experts are assigned to work along certain lines of the various industries and work in affiliation with the growers. Long continued experiment work as a rule is turned over to the state experiment station staff. Working with the force employed by the state experiment stations are many experts of the federal department. In times of special need like the pear blight campaign, citrus decay investigations, soil troubles, etc., experts have been put into the field and special reports issued in a very short time.

The division of pomology has established and maintains plant introduction gardens at Chico which have brought to the coast thousands of plants from all portions of the world and these are distributed to residents of the state who will give them proper attention and report to the department on their behavior.

Of course, the live stock sanitary board, soil survey and other divisions of the department of agriculture maintain permanent offices in San Francisco and Los Angeles. Even to list these various activities would require far more space than is at the command of the Cultivator this week.

Year Book and Bulletins. The most important publication of the department of agriculture is its year book which may be secured by writing your congressman or either senator for California. Various divisions of the department issue special bulletins, some of which may be had free by writing Division of Publications, Washington, D. C.

Weather Bureau. Probably one of the more important services rendered to agriculturalists of the state is that of the weather bureau of the department of agriculture. The bureau maintains stations at Eureka, Red Bluff, Sacramento, San Francisco, San Jose, Fresno, Independence, San Luis Obispo, Los Angeles and San Diego. While reports are given of weather conditions in practically every section of the state, the principal service rendered is in warnings of storms and frosts which, through cooperative organizations, are circulated by telephone to growers in all parts of the state.

Land Offices. The department of the interior of the federal government of course maintains its land offices in the state. These are located as given below: Eureka, Independence, Los Angeles, Sacramento, San Francisco, Susanville, Visalia.

There is one serious flaw in the helpfulness which the government and state should give to agriculturists of California and especially to newcomers, and that is in the lack of means to give out any information as to the values of government lands. One of the worst features which has sprung up in this state is that of land "locators." There may be honest locators, but as a rule the settler who has trusted to them has complained bitterly of unjust treatment. From the nature of things the seeker for government land is not the one who has capital to make investigations for himself. He is too liable to take the word of the unscrupulous locator and file upon land which, when his own engineer places the corner stakes, reveals itself as only a rock pile or on the mountain side instead of in the rich valley which the locator had described. The claim has been set up that we are overridden with commissions and officials, but here certainly is an opportunity for great help, officially, to the prospective settler.

Farm Advisers. The newest service rendered by the federal government is through the enactment of the educational extension bill by which the state receives a large fund for employing county agricultural advisers. This work is done through the agricultural college of the state university and is under direction of B. H. Crocheron, State Leader for California, Berkeley. Each county applying for a farm adviser must first organize a farm bureau with centers in all por-

SCALE
by
spraying
with
ZENO

The Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

For Sale by
Producers' Supply Co., Los Angeles; Rialto Protective Association, Rialto; Kessler Brothers, El Cajon; Harry Highfield, La Mesa.
Or by the Manufacturers,
Standard Chemical Company

Deciduous Fruit Culture

OUTPUT OF FRUITS AND NUTS

California produces an average of about 60,000 to 70,000 tons of raisins. Spain produces about 20,000, Turkey about 30,000, while of the so-called Greek currants there are produced in excess of 150,000 tons. California exported in 1911 over 18,000,000 pounds.

The output of other cured fruits, in tons, is: Apples 2,500, apricots 9,700, figs 4500, peaches 20,000, prunes 45,000.

Besides this the output of deciduous fresh fruits in carloads varies from 12,000 to 17,000.

The total output of almonds will vary from 1600 to 3000 tons, while walnuts usually crowd close to 12,000. This year the output will be smaller, between 9000 and 10,000 tons.

ACRES COVERED WITH DRYING PRUNES

The state produces about 150,000,000 pounds of cured prunes annually. The greatest production was in 1902, wit the enormous total of 195,000,000 pounds.

ORGANIZATIONS SUPPORTED BY THE STATE

Some of the organized activities of the state government which are encouraging agriculture are:

Board of Agriculture, Sacramento. A. L. Scott, President; C. W. Paine, Secretary. Holds state fairs at Sacramento annually, gathers statistics and make reports as to agricultural progress. Geo. Robertson, statistician.

Dairy Bureau, 25 California Street, San Francisco. F. W. Andreasen, Agent and Secretary. Encourages sanitary dairying and has police power in enforcing sanitary dairy laws.

Forester, G. Morris Homans, Sacramento. Preserves existing forests and encourages forest extension. At request of private owners examines timber lands and sites for planting.

Highway Commission, Forum Bldg., San Francisco. W. R. Ellis, Secretary. In charge of constructing and maintenance of state highways under $18,-000,000 bond issue and fund from auto license tax.

Horticultural Commission, Capitol, Sacramento. A. J. Cook, Commissioner. State Insectary, Capitol Park, Sacramento. Harry S. Smith, Superintendent. Quarantine Office, Room 11, Ferry Building, San Francisco; Frederick Maskew, Chief Deputy Quarantine Officer. Offices Quarantine Deputies: Hall of Records, Los Angeles; Court House, San Diego. Has police powers in enforcing horticultural laws. Also holds semi-annual conventions of fruit growers. Issues bulletins free to citizens of California.

Reclamation Board. V. S. McClatchie, President; W. T. Ellis, Marysville, Secretary.

Panama-California and Panama-Pacific International Exposition Commissions. Have to do with expenditure of moneys appropriated for expositions at San Diego and San Francisco.

Immigration and Housing Commission. S. J. Lubin, President; Paul Scharrenberg, Secretary. 525 Market St., San Francisco. Encourages sanitary housing of labor camps. Has police powers.

Redwood Park Commission in charge of California Redwood Park of 3,800 acres in Santa Clara and Santa Cruz counties.

Veterinarian, Dr. Chas. Keane, San Francisco. Dr. W. B. Rowland, Pasadena, Assistant. Has charge of employment of live stock inspectors, has quarantine powers and general enforcement of live stock sanitary laws.

Viticultural Commission. Nine members. President, C. J. Wetmore; Secretary, E. M. Sheehan, Capitol, Sacramento. Recently created commission to encourage grape industry.

Association County Horticultural Commissioners. R. S. Vaile, Riverside, Secretary. Semi-official organization of county officials to secure more uniform enforcement of horticultural laws.

University of California, College of Agriculture, Berkeley. Thos. Forsyth Hunt, Dean. School for agricultural students at University Farm, Davis; H. E. Van Norman, Vice-director. Experiment Station at Berkeley, Thos. F. Hunt, Director; branches at Davis, Kearney Park, Fresno; Imperial Valley Station at El Centro, W. E. Packard in charge, and Forestry Experiment Station, Santa Monica. Southern California Experiment Station, Dr. Herbert J. Webber, Director, with Pathological Laboratory at Whittier.

One of the most helpful features of the state experiment station and college of agriculture work is probably the bulletins. Some of the most val able works yet issued as to walnut olives, diseases of the orange ar lemon, deciduous fruits, etc., and pra tically all other lines of agricultur activities have been published by tl state experiment stations. These ma be secured by writing to the directe of the experiment station at Berkele and asking to be placed on the reg lar mailing list, or perhaps better, sta ing the particular line along which i formation is desired.

Correspondence courses in agricu ture are conducted by University E tension Division, Berkeley.

Farmers' Short Courses at Unive sity Farm, Davis. Address Dean, Co lege of Agriculture, Berkeley.

Polytechnic School, San Luis Obisp Leroy B. Smith, Director.

VOLUNTARY ASSOCIATIONS

The following is a partial list of a sociations organized to advance th interests of a particular feature agricultural industry:

California Agricultural District Fai Association. President, E. E. Ha Pleasanton. Secretary, W. J. Daki Pleasanton.

California Association of Nurser men. President, D. W. Coolidge, Pas dena. Secretary, Henry W. Kruck berg, Los Angeles.

California Creamery Operators' A sociation. President, A. R. Bate Secretary, A. P. Ferguson, Turlock.

Costs You Nothing

to try this wonderful new Aladdin kerosene (coal oil) mantle lamp 10 days right in your own home. You don't need to send us a cent in advance, and if you are not perfectly satisfied, you may return it at our expense.

Twice the Light on Half the Oil

Recent tests by noted scientists at 14 leading Universities, prove the **Aladdin gives more than twice the light** and **burns less than half as much oil** as the best round wick open flame lamps on the market. Thus the Aladdin will pay for itself many times over in oil saved, to say nothing of the increased quantity and quality of pure white light it produces. A style for every need.

Over Three Million

people now enjoy the light of the Aladdin and every mail brings hundreds of enthusiastic letters from satisfied users endorsing it as the most wonderful light they have ever seen. Such comments as "You have solved the problem of rural home lighting"; "I could not think of parting with my Aladdin"; "The grandest thing on earth"; "You could not buy it back at any price"; "Beats any light I have ever seen"; "A blessing to any household"; "It is the acme of perfection"; "Better than I ever dreamed possible"; "Makes my light look like a tallow dip"; etc., etc., pour into our office every day. **Good Housekeeping Institute,** New York, tested and approved the Aladdin.

We Will Give $1000

to the person who shows us an oil lamp equal to the Aladdin (details of this Reward Offer given in our circular which will be sent you). Would we dare invite such comparison with all other lights if there were any doubt about the superiority of the Aladdin?

Get One FREE

We want one user in each locality to advertise and recommend the Aladdin. To that person we have a special introductory offer under which one lamp is **given free.** Just drop us a postal and we will send you full particulars about our great 10 Day Free Trial Offer, and tell you how you can **get one free.**

THE MANTLE LAMP COMPANY
51 Aladdin Building Portland, Ore.
Largest Manufacturers and Distributors of Kerosene Mantle Lamps in the World.

Men With Rigs Make Big Money

delivering Aladdin lamps. No previous experience necessary. One farmer who had never sold anything in his life made over $500.00 in six weeks. Another says: "I disposed of 34 lamps out of 31 calls.

No Money Required We furnish capital to reliable men to get started. Ask for our distributor's Easy-System-of-Delivery plan quick, before territory is taken.

Krogh Pumps

Make Money—Save Money

Why Wait Until the Rush?

Now is the time to prepare for your winter irrigation. The importance of your water supply makes it necessary that you should use the utmost care in selecting your equipment.

Write us, stating your conditions, and one of our Field Engineers will call at your ranch. He will advise you carefully—and he knows what will be best for you.

Krogh Mfg. Co.

Farmers' Education and Cooperative Union of America. President, Wm. McNaught, Morgan Hill. Secretary, Fred Millard, Los Gatos.

Farmers' and Fruit Growers' Federation. F. O. Wallschlaeger, Secretary, 740 Consolidated Realty Bldg., Los Angeles.

A TYPICAL APRICOT

A greater proportion of dried apricots are exported than any other of our cured fruits. Production is about 20,000,000 pounds annually.

Holstein Breeders' Association of California. Secretary, Jas. W. McAlister, Chino.

State Grange Patrons of Husbandry. Master, E. T. Pettit, Cupertino.

COOPERATIVE MARKETING

The following are cooperative marketing associations which are statewide in scope:

California Almond Growers' Exchange. President, G. W. Pierce, Sacramento. Secretary, J. B. Wrangham, Sacramento.

California Associated Raisin Company. Manager James Madison, Fresno.

California Cured Fruit Exchange. Manager, H. M. Ellis, 417 Market St., San Francisco.

California Fruit Growers' Exchange. Manager, G. Harold Powell, Consolidated Realty Bldg., Los Angeles.

California Walnut Growers' Exchange. President, C. C. Teague, Santa Paula. Secretary, C. Thorpe, 313 Fay Bldg., Los Angeles.

Lima Bean Growers' Association. Manager, Perry A. Cole, Oxnard.

Citrus Protective League. Secretary, F. O. Wallschlaeger, 740 Consolidated Realty Bldg., Los Angeles.

Fruit Growers' Supply Company. Manager, B. N. Hutchins, Consolidated Realty Bldg., Los Angeles.

It is impossible to get a full list of farmers clubs and similar organizations, and it would be impossible to give a complete list of all the cooperative marketing organizations in this state. One of the greatest of these is the California Fruit Growers' Exchange which handles twenty-five or thirty million dollars' worth of citrus fruits for its members each year. There are other growers selling organizations, and as a rule these organizations are proving money savers for their members. While there have been some mistakes, the general trend of the agriculturists of the state is toward more cooperation.

COMMERCIAL ORGANIZATIONS

To those who wish information regarding the various counties of the state we would suggest writing the principal commercial organization of the county. The list below gives the county organization or the more important organization within each county of California, excepting the three counties of Alpine, Modoc and Mono, which counties do not report such organization.

Abbreviations used: Co. C of C, County Chamber of Commerce; B of T, Board of Trade.

County, Organization, and Address.
Alameda, Alameda C. of C., Oakland.
Alpine.
Amador, Amador Co. C. of C., Jackson.
Butte, Business Men's Ass'n, Oroville.
Calaveras, C. of C., San Andreas.
Colusa, C. of C., Colusa.
Contra Costa, B. of T., Martinez.
Del Norte, Commercial Club, Crescent City.

Other Associations—For information regarding the state in general address California Development Board, Ferry building, San Francisco.

Let us learn to be content with what we have. Let us get rid of our false estimates, set up all the higher ideals —a quiet home; vines of our own planting; a few books full of the inspiration of a genius; a few friends worthy of being loved and able to love us in return; a hundred innocent pleasures that bring no pain or remorse; a devotion to the right that will never swerve; a simple religion empty of all bigotry, full of trust and hope and love —and to such a philosophy this world will give up all the joy it has.—David Swing.

Beautify Your Home

USE WALL BOARD

When Building Your New Bungalow and Garage or Remodeling Your Home.

BEAVER BOARD

BEAVER BOARD

is ideal for the production of beautiful panel effects, and makes old and unsightly walls durable and artistic.

It does not crack or damage like plaster, and is easily applied.

SCHUMACHER WALL BOARD

Made in Los Angeles

It is cheap as lath and plaster and a perfect substitute. Can be finished in any manner desired — paneled, tinted, papered or sand painted.

A fire resister and sound deadener.

PEORIA DRILLS Save Seed Increase Yield

Pity the Poor Bird—

—who follows a Peoria Drill. There isn't a chance for him to get a bite of grain, for the patented disc shoe deposits it all at the exact depth desired on the bottom of the furrow. Moisture is secured and the wind cannot uncover the seed. Being planted at an even depth, grain germinates and ripens evenly.

Peoria Drills are made right in every particular. Frames especially strong. High steel wheels. Feed is governed by speed; accurate, never misses; the only really reliable feed.

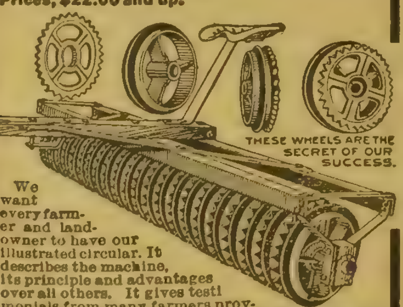
3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. Sold direct to you on one year's trial. Prices, $22.00 and up.



THESE WHEELS ARE THE SECRET OF OUR SUCCESS.

We want every farmer and land-owner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

WESTERN LAND ROLLER CO.

Big Money in Fruit and Vegetables

Fortunes Are Being Made

every year in Florida out of Fruits and Early Vegetables. Not a better spot in the whole state than BAY VIEW. Our big, free handsomely illustrated Book will prove it to you.

Soil is deep, rich, sandy loam—very exceptional for Florida. Sample of this soil mailed free with literature. Plenty of rainfall 12 months in the year. Irrigation is unheard of. Crop failures practically unknown. Two and three crops easily raised each year on the same ground. $50 to $500 profit per acre each year. Satsuma oranges, figs, pears, peaches, plums, grapes and all kinds of berries produce abundantly. You can also raise enormous crops of corn, oats, hay, Japanese cane, clover, sweet and Irish potatoes, sugar cane, celery, tomatoes, lettuce, cabbage, watermelons, cantaloupes, egg plant, cucumbers, radishes, turnips and all kinds of early profitable vegetables. Ideal location for Dairying and Stock Raising. Ready markets and good prices. Grass for pasture the year round. Don't have to stable and dry feed six months in the year. One of the finest climates in the United States, both summer and winter. No sunstrokes in summer—no frostbites in winter. Ideal salt water boating, bathing and fishing. Lumber at wholesale prices. Good stores, churches and schools. WRITE TO-DAY FOR FREE BOOK, SAMPLE OF SOIL, MAPS, ETC.

Small Fruits and Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris

It is high time that all vegetables for early winter crops be planted. Most anything in the ordinary class is in order, in fact, everything but vine seed. For small gardens or commercial planting the following may be planted with safety: Beets, carrots, broccoli, Brussels sprouts, cabbage, cauliflower, chard, lettuce, onions, parsley, spinach, radish, peas and the hardy varieties of beans, such as Refugee, Canadian Wonder, Green Pod, Early Six Weeks and Early Valentine. Horseradish, rhubarb, chives and onion sets can also be planted with a reasonable assurance of good results.

We recommend the following list of best varieties for planting at this season: Lettuce, New York and Wonderful; onions, White Cream, Silverskin and Bermuda; cabbage, Winningstadt, Cannon Ball and Danish Ball Head; turnips, for a large turnip, Purple Tops; for family use, Early Snowball and Golden Ball, sweeter and of finer quality. Rutabagas are becoming more popular each year. Brussels sprouts and kohl rabi are two vegetables which have been greatly neglected and which succeed splendidly if planted at this season of the year. Another vegetable which deserves more attention is the red cabbage. Each year finds a more ready market for it at good prices. Two popular varieties are the Zenith and Red Drumhead. The leading varieties of cauliflower are the Dry Weather and California Pearl. These are large headed varieties being what are termed well-covered heads, that is, the leaves fold over and protect the head. Best varieties of carrots on the market are Ox Heart and Chanteney or Half Long. For table beets, plant Detroit Blood or Egyptians.

The use of the hoe is too often disregarded; yet it is one of the most valuable tools for garden purposes. The use of the hoe will obviate the necessity for a large number of waterings. A loose pulverized soil is far better for garden plants than a continually wet soil. With a fine loose earth mulch, gardening gives greater success than with a heavy, hard and often sodden surface, the result of frequent waterings. Further, excessive water considerably weakens garden plants, and the more water they get the more they want; in an undrained soil, excessive and constant waterings result in weakened plants, a decaying root system, and loss of good and useful plants.

THE KITCHEN GARDEN

A great trouble with many kitchen gardens is crowding plants too close together, which gives poor results. No plant can reach a maximum growth without plenty of room. It requires room to make quality. Selected varieties of known quality are better than a lot of novelties, which too often are disappointing. After furnishing ground, fertilizer and labor, one should be reasonably sure that the variety is one that can be depended upon. What to raise in the garden should be a matter of the family likes, and a list of varieties should always be selected with this object in view.

Roses and other growing plants should now be carefully watched for any signs of the usual aphis troubles. These insects considerably enfeeble the young growths and are productive of considerable loss. Wherever observed the aphids should receive frequent sprayings and washings with tobacco wash prepared from waste tobacco, or with any of the tobacco extract preparations. For mildew on roses and other plants, frequent and liberal dustings of sulphur will be necessary. All useless shoots on roses and shrubs of all varieties should now be rubbed off, so as to direct the sap into useful and necessary channels.

One of the recognized consequences of subsoiling is an increased feeding area for the roots; and thus, in some instances, manure is not always necessary. Practical fruit growers point to portions of their orchards which have been in full bearing for nine or ten years, which were subsoiled before planting, and which have never received an ounce of manure. The fruit crops from such orchards are invariably good, and often in excess of other parts of the orchard, which were not so subsoiled.

Surplus and misplaced shoots of roses should be removed as they appear, and where fine blooms are desired the buds thinned. Newly-planted roses should be mulched, and a little care taken in the arrangement of the shoots, especially on standard specimens. An occasional dusting with flowers of sulphur will prevent mildew.

Where tomatoes have been planted, their energies should be restricted to three or four main growths, and all laterals pinched out, leaving only the flowers and flower buds.

VEGETABLES THE FINEST
The Chinaman formerly grew most of our vegetables; now we grow them—fresher and finer.

The Ornamental Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator

By O. M. Morris

The principal work in the flower rden at this time is the forcing of rysanthemums with strong fertiliz- s and plenty of water. If large wers are desired one must not glect disbudding and thorough care om now until height of blooming sea- n. If the plants are not very robust ey should be staked or tied up and otected from the wind. In this cli- nate the sun is very warm and for est colored flowers it may be neces- ary to pull a cloth over the blooms uring the day, using the same cover- ng during foggy nights. This will reatly increase the value and ap- earance of the flowers.

Roses should be heavily trimmed ack, fertilized and given as much at- tention as possible to insure good flowers during the early winter.

Perennials planted last month or the month before should be nearly ready to transplant now, at least most of them. One may transplant to permanent beds, or put small beds ready for planting out in the spring.

Nearly all varieties and the hardy annuals can be planted for winter and early spring bloom. California poppies, in fact, any of the poppies, can be put in at once if the ground is well irrigated and kept moist until the winter rains come. We have heard many complaints of poor results from hunnemania, or Giant Yellow Tulip Poppy. In nearly every instance the failure is the result of too deep planting of the seed and keeping the ground too wet. This is an upland poppy of the bush form and it must not be kept too moist or it will damp off and rot before making a start. After the plant puts out six to eight leaves it will be perfectly safe and will stand a great deal of moisture, but prior to that an excess of moisture will result in much damage.

The following list is timely for this season's planting: Centauria, scabiosa, snapdragon, linum, schizanthus, linaria, mignonette, coreopsis, gaillardia, gypsophila, and sweet peas for winter blooming. The latter will give an abundance of flowers during the colder season when cut flowers are always scarce. Phlox drummondii has proved to be a splendid good flower, standing our winters perfectly and blooming for several months. The flowers, when cut, last for a number of days. Pansies and stocks should be planted for early winter transplanting. These will begin to bloom in about four months. Seed not to be planted too deep. It should be barely covered, not over one-eighth of an inch. Where stocks have not succeeded well after transplanting, would advise planting the seed in permanent beds and we doubt not they will succeed. This latter method will require a more liberal planting of seed for a good stand, but the surplus plants may be thinned out and replanted. In light soil it will not be necessary to cover the beds but on heavy soil seed should be covered with a sandy silt or loam to prevent baking. The best bed of stocks seen this year were those started directly in the bed where they are to remain.

Bulbs are now arriving and the usual line will be available, contrary to previous reports. Several large shipments have arrived already and others are following, so that there will probably be no shortage. The sooner the supply of bulbs is secured the better selection will be obtained. Hyacinths, tulips, and daffodils will give better results if planted early.

ORNAMENTAL AND WONDERFULLY USEFUL

Even the eucalyptus introduced from Australia grows more wonderfully than in its native land and it adds beauty to almost every California landscape.

Two Noteworthy Schools for Young Women

The Cumnock Academy

A four-year course, preparatory to college; also a general course, and two years of sub-preparatory. Students have an opportunity to take courses given by the EXPRESSION SCHOOL faculty. Strong Music and Art Departments. A limited number of boarding students will be accepted.

The Cumnock School of Expression

A three-year course in all branches of Literary Interpretation and Expression. Story Telling—Public Reading—Dramatic Art—Public Speaking—Journalism—the Speaking Voice—Aesthetic Dancing—Art and Music. Adequate training for readers and teachers of expression and unusual character development through self-expression.

In Both Schools:

Physical training is emphasized. The schools' beautiful buildings are situated in a charming, retired location, with an opportunity for all types of healthy out-door recreation.

President Wilson:

"I was most gratified to hear of the nomination of former Mayor James D. Phelan for United States Senator. He has been in close touch with the administration in Washington, and has heartily supported the policies which have been inaugurated for the benefit of the people—

"Therefore, I appeal not only to Democrats, but to all independent citizens to rally to the support of the men who have expressed a willingness to sustain the administration and carry on the work designed for the benefit of all."

Woodrow Wilson

JAMES D. PHELAN

James D. Phelan was three times Mayor of San Francisco

Prevented renewal of franchise of old Geary street railway, San Francisco, thus making present successful municipal line possible.

Appointed first woman who ever held an important public position in San Francisco.

Served as regent of the University of California.

Commissioner to secure re-enactment of the Geary Asiatic Exclusion Law.

Commissioner for Hetch Hetchy legislation before Congress to secure a mountain water supply for the cities around San Francisco Bay.

Commissioner to Europe by appointment of President Wilson to support the United States Government's invitation to foreign countries to participate in the Panama-Pacific Exposition.

Declined ambassadorship to one of the great European nations, preferring service at home.

Led in the fight for a new charter for San Francisco, which insured home rule, civil service reform, responsible government, municipal railroads.

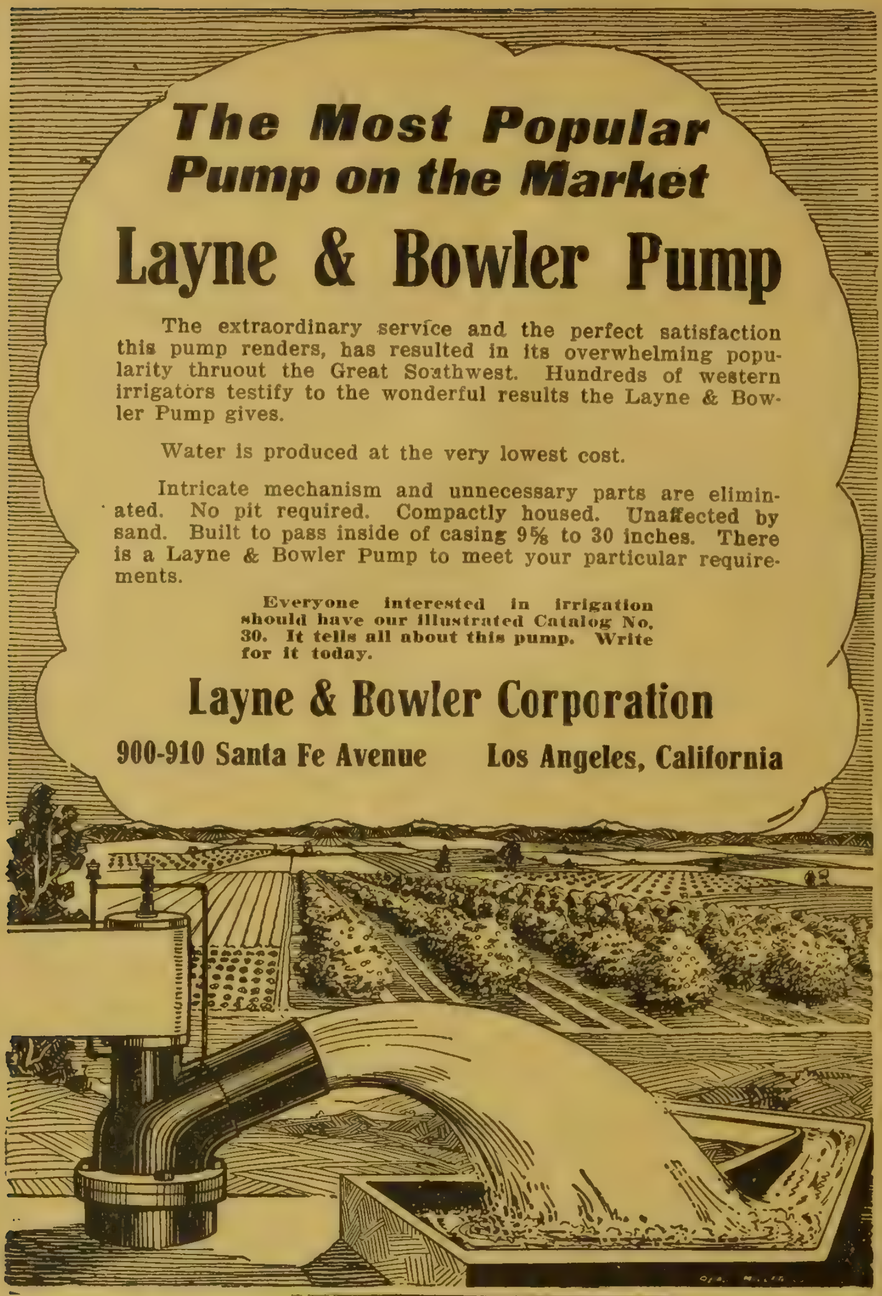
Raised standard of pay for laborers in the city employ.

Head of the San Francisco Relief Committee in the disaster of 1906. Appointed by the President custodian of the relief fund aggregating $10,000,000.

Worked and spoke before the Legislature for the enactment of an anti-alien land ownership law.

Experienced, capable and untrammelled, he would have but one client in Washington, the people of his native State.

Elect the man who can help California in Washington



The Most Popular Pump on the Market

Layne & Bowler Pump

The extraordinary service and the perfect satisfaction this pump renders, has resulted in its overwhelming popularity thruout the Great Southwest. Hundreds of western irrigators testify to the wonderful results the Layne & Bowler Pump gives.

Water is produced at the very lowest cost.

Intricate mechanism and unnecessary parts are eliminated. No pit required. Compactly housed. Unaffected by sand. Built to pass inside of casing 9⅝ to 30 inches. There is a Layne & Bowler Pump to meet your particular requirements.

Everyone interested in irrigation should have our illustrated Catalog No. 30. It tells all about this pump. Write for it today.

Layne & Bowler Corporation

900-910 Santa Fe Avenue Los Angeles, California

COVER CROPS

Fenugreek
Melilotus
Burr Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300% Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

General Agriculture

IN CALIFORNIA

Sugar Beets

California is the home of the sugar beet industry of America. The first factory was that at Alvarado, in Alameda County. Now there are 13 factories producing about 170,000 tons of sugar annually. Last year's acreage was 115,330, and the beets worked up 1,100,307 short tons. The factories operating are located at Alvarado, Oxnard, Chino, Hamilton City, Spreckels, Betteravia, Anaheim, Huntington Beach, Corcoran, Los Alamitos, Visalia, and two at Santa Ana.

With the European war stopping exports of sugar, it is presumed the coming year will give a great impetus to this industry. At the present time there is some difficulty in securing the seed required for another year, but we are told that the sugar companies are making an effort to secure a supply from Holland which will be ample for the coming year's output.

Sugar beets brought to the growers last year $5,000,000.

SUGAR BEETS AND WORLD'S GREATEST BEET SUGAR FACTORY
California produces more sugar than any other state of the Union.

Rice

California has hardly been considered a rice-producing state, but we are told that the coming year will see a planting of at least 15,000 acres, which will yield possibly as high as 3,000 pounds per acre. California rice has won gold medals until it has shown its ability to produce fine quality of grain. The principal producing section is in Butte County. The value of rice harvested in California this year will probably be close to $1,000,000.

Cotton

The Imperial Valley has proven itself a wonder in the production of high-grade cotton. The staple is longer and finer than that produced in the South. The financing of the crop this year is proving a serious matter because of the stoppage of exports. Bankers and others are now encouraging the "buy a bale" movement, and it is predicted that the situation will be materially cleared within a few weeks. The state has now an acreage of about 26,000. The production is somewhat under a bale to the acre; probably between 16 and 18 thousand bales will be produced. Mexico, just over the line, is producing as much more.

Hay

There are 20,000 farms in California growing alfalfa. On these 20,000 farms there are 484,134 acres producing 1,639,707 tons, valued at about $13,000,000.

Timothy is not considered a California crop, yet there are reported to be 13,000 acres of timothy in this state, producing some 20,000 tons. Of other tame and cultivated grasses we produce 119,000 tons.

Our great hay crop, however, is the ordinary "grain hay," principally barley. Of this crop we produced about two and a half million acres, and the output is valued at nearly $52,402,000.

Beans

California produces of lima beans over 1,100,000 sacks per year, which bring to the state in coin between $4,000,000 and $5,000,000. Pink beans are next in importance, the state producing 350,000 sacks, valued at approximately $1,000,000. White beans, 120,000 sacks, valued at a half million dollars; blackeyes and other varieties, a half million sacks, valued at over a million and a quarter dollars. This makes the bean crop of the state net to the growers about $7,000,000.

Onions

The output of the state in onions is nearly 2,000,000 sacks, netting to the producers $2,750,000.

Potatoes

One of California's greatest crops is the Irish potato. Nearly 9,000,000 sacks are produced, and while prices vary greatly, approximately we may say they net to the growers $10,000,000 annually.

Sweet potatoes likewise are a great product, though much less in quantity than Irish potatoes, and bring to the state $1,200,000.

Seeds

In the production of garden seeds California is one of the best and most favored sections, but there are no very accurate figures as to the output. The principal seeds which do well in this state are lettuce, onions, radishes, sweet peas. Two and a half million dollars is brought to the state because of this industry.

Hops

Sacramento County is the greatest hop-producing county of the state. It has a total output of about 35,900 bales. Sonoma comes next with 35,700 bales, then come Yuba and Yolo, Mendocino and Lake, also great producers of hops. All told, the state produces about 117,770 bales.

Grains

California was at one time the greatest producer of wheat in the country The banner year was 1899, when she produced 30,000,000 bushels. Since ther there has been a gradual decrease until the year 1913 harvested but slightl in excess of 4,000,000 bushels. This year the production is far greater and fortunately, is bringing a good price.

Barley, on the other hand, has ver materially increased in production Taking the same year, 1899, for a start er, the state produced 14,000,000 bushels. This greatly increased until 1910 when 43,000,000 bushels was reached The year 1913 produced about 33,000,000 bushels, and while the presen year's output breaks all past records figures as to exact output are not ye obtainable.

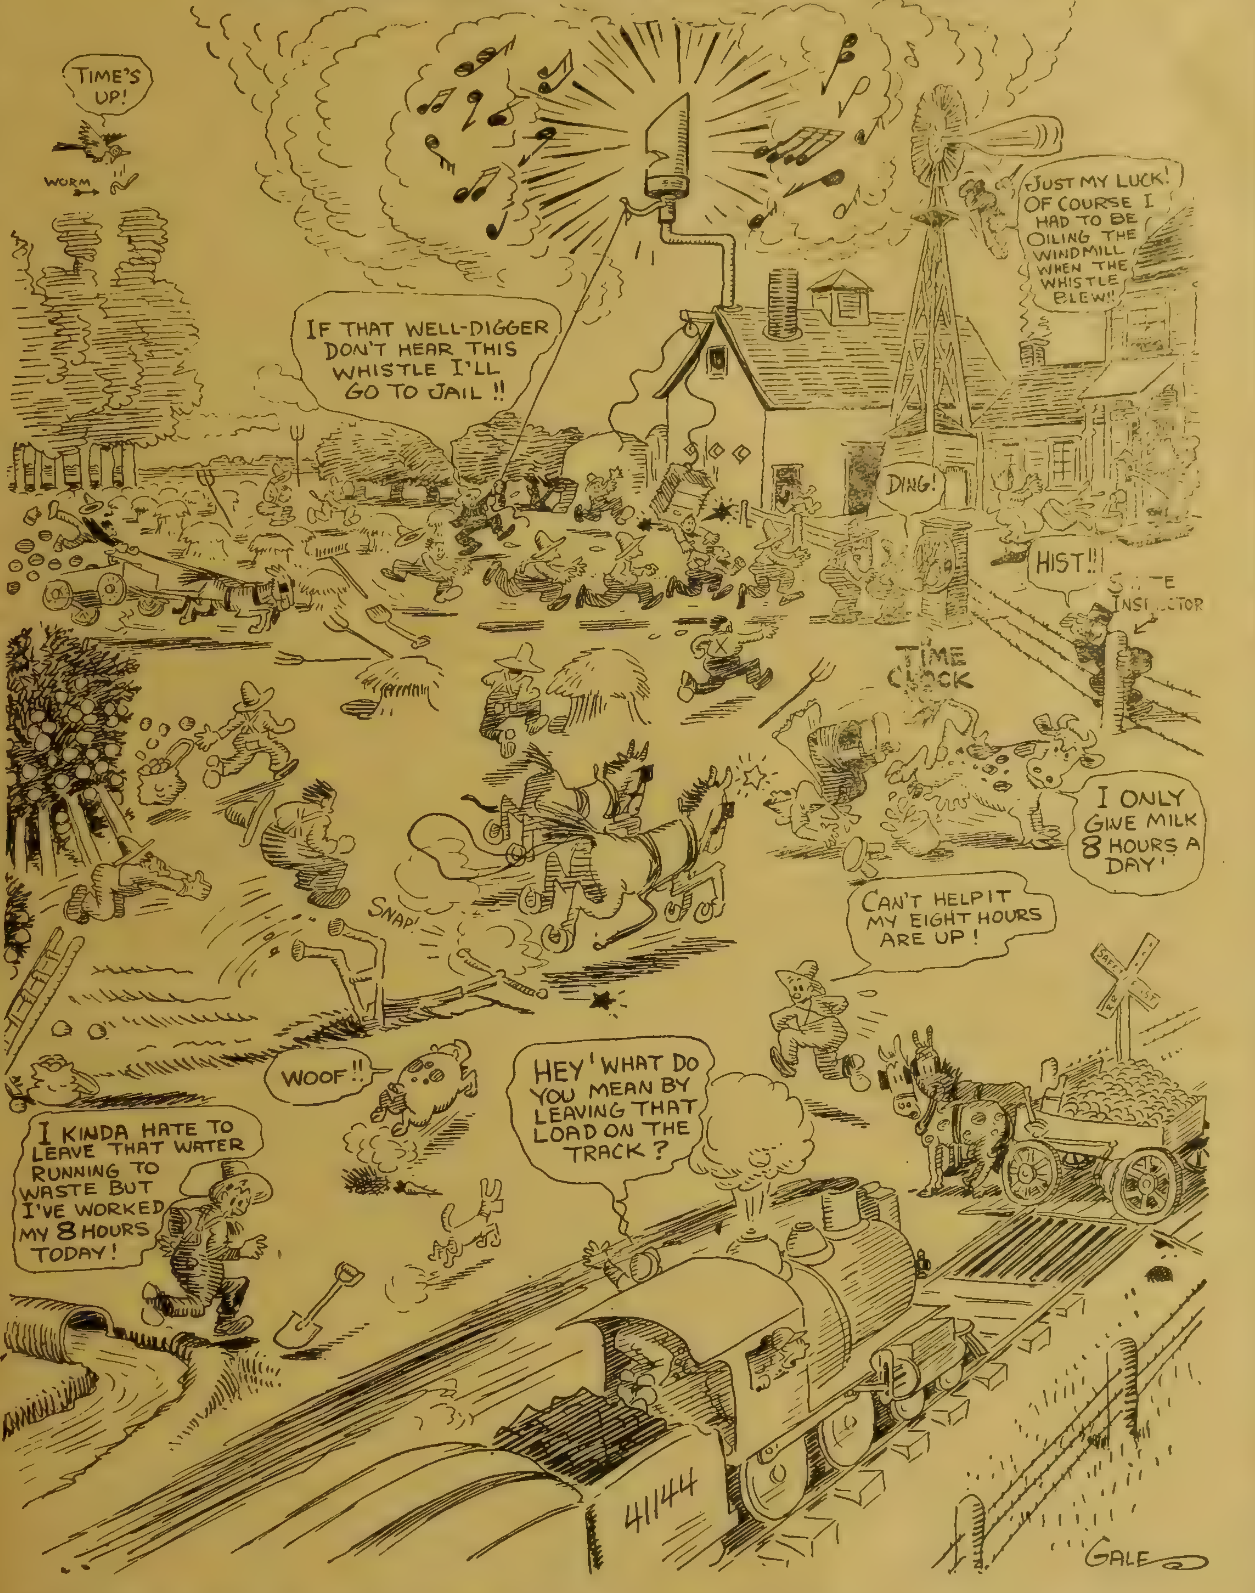
The production of oats has likewis materially increased until it now varie from seven to eight million bushels annually.

Corn

Of corn, though we are not generally considered a corn state, we produce close to 2,000,000 bushels. Last year's output was 1,815,000 bushels.

A farmer cannot make a more profitable investment than to buy a gallon of good implement paint and have it always on hand. Paint the wagon, the binder tongue, the plow tongues, the walking plow haudles, the doubletrees, every thing that needs protection from the elements in the way of machinery should be kept painted. As long as a good coat of paint adheres to wood it will last without checking or decay. It will also keep the iron from being eaten up with rust.

THE EIGHT-HOUR WHISTLE ON THE FARM.



TIME'S UP!
WORM
JUST MY LUCK! OF COURSE I HAD TO BE OILING THE WINDMILL WHEN THE WHISTLE BLEW!!
IF THAT WELL-DIGGER DON'T HEAR THIS WHISTLE I'LL GO TO JAIL !!
DING!
HIST!!
STATE INSPECTOR
TIME CLOCK
I ONLY GIVE MILK 8 HOURS A DAY!
SNAP!
CAN'T HELP IT MY EIGHT HOURS ARE UP!
WOOF!!
HEY! WHAT DO YOU MEAN BY LEAVING THAT LOAD ON THE TRACK?
I KINDA HATE TO LEAVE THAT WATER RUNNING TO WASTE BUT I'VE WORKED MY 8 HOURS TODAY!

BIRD'S-EYE VIEW OF THE SOCIALIST PLAN FOR CALIFORNIA AGRICULTURE.
Vote "NO" on Universal 8-Hour Law, Proposition No. 3.

ELEGY WRITTEN IN A CALIFORNIA FARM YARD

Written for California Cultivator
By Contributor from El Centro

The whistle shrieks to end the eight-hour day;
  The teams and cows bound swiftly o'er the lea;
Homeward the farm-hand takes his legal way,
  And leaves the chores to Mother and to me.

Now fades the harvest profit from my sight,
  And all the world a penal sentence holds,
Save when Old Sol my year's crops blight
  And Socialists control the heat and cold.

Save where, in yonder pillow-cushioned bower,
  My resting plowman does to the cook complain,
That echoes of my toil to beat a shower,
  Molest his leisure there safe from the rain.

Ground Limestone
for
Agricultural
Purposes

WESROCK QUALITY
WESTERN ROCK PRODUCTS COMPANY SAN FRANCISCO

Our ground limestone for fertilizing is made of the highest quality of limerock obtainable, is an honest material, honestly prepared. It is ground to that fineness which the Agricultural Department of the University of California recommends as rendering the greatest efficiency. Ground limestone sustains the fertility of the soil, corrects acidity, makes clay and clay adobe soils looser and easier to cultivate, etc. You can get prompt deliveries from us either in bulk or packed in 100-pound sacks. Write us for further information, prices, terms, etc.

Western Rock Products Co.
Balboa Bldg., San Francisco

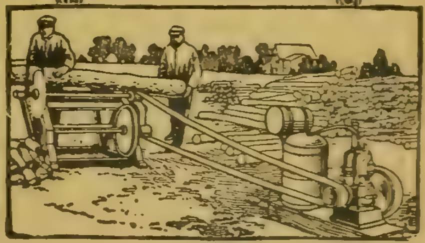
Light Weight
Cushman Engines
Best for Heavy Sawing

John Dare, Oroville, Cal., writes: "I have sawed about 350 tiers of wood with my 4 H. P. Cushman, and haven't had to make any repairs or lose any time. It is in as good shape as the first day I used it. The Cushman is the only 4 H. P. engine that can handle this work. **Throttle Governor giving extra power** when saw strikes the log. I have a 26-inch saw, with 100-lb. fly-wheel, and when I get this outfit under motion there is something doing. We have sawed logs as high as 20 in. through."

Light Weight
Cushman Engines
For All Farm Work

Are the lightest, yet most reliable and useful engines made for farm work. Easily moved around to do all the stationary work, as well as attached to power driven machines, such as binders, hay balers, sprayers, etc. **Throttle Governed**, Schebler Carburetor, **Quiet and Steady**, Economical of Gasoline, **Perfectly Balanced**, Almost No Friction. 4 to 20 H.P. 40-page Book free.

Cushman Motor Works
804 North 21st St., Lincoln, Nebraska



Perforated
Tree
Protector

The only Perforated Protector made; practically a small lath house about each tree, allowing the free circulation of air and mellowing the hot rays of the sun while giving perfect protection. No mouldy, smutty bark when using our wraps. WHEN DOES YOUR TREE NEED PROTECTION WORST? You know—while it is young and tender. Let us sell you Protectors. It's the best investment you can make after planting your trees. If your dealer hasn't them, send your order to us and we will fill it promptly.

LEGISLATIVE MATTERS

The counties committee of the California Development Board will hold its twentieth session at Santa Rosa, October 23-25. The principal subject to be discussed is legislative measures now under consideration in California.

ROYAL CALIFORNIA

The Cultivator has just received a communication O. H. M. S. from the publications branch of the department of agriculture at Ottawa. It was addressed to "Royal California," and presumably was intended for the Rural Californian, formerly published by this company and now merged with the Cultivator. The name is suggestive and a most excellent one for our royal state.

OPPORTUNITY FOR LABORERS

With all the coming to California there has been some unscrupulous or mistaken work. One feature of this work is the policy of some large employers in urging people to come where wages are high and work is plentiful. It is true there is plenty of work to be done in California, and there is at times difficulty in securing the hands to do it, but to urge a general immigration of laborers with their families, without sufficient means for support, is at this tme most unfortunate.

THREE MILLIONS

While the United States census for 1910 showed California's population to aggregate 2,377,549, it is to be noted that a census four years past due is of but little value in California. The state is a grower, as shown by its increase of 60.1 per cent during the last decade, while at the same time the increase the country over was only 21 per cent. So we are perfectly safe in saying that the best of the earth is continuing to come to California, and that we have a population within our boundaries today in excess of 3,000,000. After the expositions are over we shall be compelled to add another million to our figures, at least, if not to our population.

Most satisfactory is the fact that the counties in which agriculture is the principal industry show the greatest percentage of increase of population. In this connection we trust we may be pardoned for referring again to the fact that California has one county—Los Angeles—which produced crops valued on the farm at $14,720,900, which made it first in the ranks of all counties of the United States in total production. A Pennsylvania county ranks next with nearly $2,000,000 valuation under the California county.

STATE NEWSPAPER DAY

Judge Hayes of San Diego suggested that the thousand papers published in California should devote Oct. 1 to the observation of newspaper day, giving special effort to make known the commercial and agricultural possibilities of California and incidentally boost for the great expositions which will be held during 1915. A similar day was observed in San Diego nearly a year ago, and proved most helpful in attracting attention to a number of things which even San Diegans did not know regarding their own city. Doubtless the day will result in informing many Californians regarding their own state, and among the thousand papers which will publish material many will find their way into the hands of Easterners who will come to help us feed the world.

The Cultivator takes pleasure in joining in this movement, and we hope some things are said in this number which will increase the pride of Californians in their own state. We certainly are producing wonderfully along some lines; we need to produce far more along others. The soil, the water and the climate are all here; it needs but little capital and much labor and intelligence on the part of many to bring fullest development. Let us all work with a will from this moment to make our state more attractive and even more beautiful, that it may draw the eyes of the world to some of its possibilities during 1915. The two exposition cities will not hold the people all the time.

ORCHARD RETURNS

Careful estimates have been made as to the returns from the orchards of California, and it is claimed that at least $82,000,000 will be secured from this year's crops. The value of all the products of the state, manufactured and mineral, as well as agricultural, is $476,000,000. So if the estimates are fairly correct, one-sixth of the wealth of this state depends upon trees and vines.

THE EXPOSITIONS

The Panama-California opens at San Diego January 1. The Panama-Pacific International Exposition opens in San Francisco February 20, yet the management of each of these great fairs is planning for just as great a crowd, or even greater, as if there were no wars devastating Europe. Sure it is that tourist conditions in Europe will be vastly different next year and for some years to come from conditions in years past, and probably travel to those countries will be greatly reduced. The supposition is that the half million Americans who usually plan to summer in Europe will this year come to California.

In any case those who do attend will have long value for their money expended. The state will have two great expositions. That at San Diego is unique in its method of showing the resources of California, and it will show them to people who will appreciate the information. Of course, the great exposition at San Francisco is on a larger scale. It is truly a world's exposition. By many millions of dollars it is far greater than any preceding event. We have seen the buildings and the grounds, and we must confess that the impression conveyed by the first look down upon the buildings from the heights is almost awe-inspiring.

STATE CONVENTION

The committee in charge of arrangements for the coming forty-fifth state fruit growers' convention at Los Angeles has secured the auditorium in which the sessions will be held and hotel headquarters at one of the best and most attractive hotels of the city. Dr. Cook and Dr. Webber, with other members of the program committee, have not only outlined the program; they have it practically completed, with assurances of addresses from many of the best people in horticultural lines in the world. In fact, so many acceptances have been received that instead of beginning on Wednesday morning the sessions are programmed to begin on Tuesday evening, and while it is still a question as to whether it will be advisable to hold a Saturday evening session, there is so much that will be good that can be slated for that evening that it is possible a Saturday evening session will also be held. The committee at one time resolved not to accept the invitation of the Los Angeles members for an afternoon for auto ride or other diversion, for the program was so filled that it seemed impossible, but many members feel that at least a little time should be taken during the convention for relaxation. At any rate a big time is promised. Another week the Cultivator will outline the program, and it will certainly be attractive enough to draw people from all sections of the state. Contracts have already been made with the railway companies for reduced rates.

Agricultural News Notes

Something is wrong in our marketing system when a small crop brings more money than a bountiful one.

Intelligent diversification of crops is the safest practice unless one be especially well prepared to specialize.

The question of standardization goes to the whole root of farmers' selling problems. You must inspect.

Attention should be given to the minor crops which are to supply feed for the stock and furnish food for the table.

Fruits are a necessity, not a luxury, from the standpoint of ideal conditions of health, and should be on the table in every home.

Farming is a business and the management of the farm must be conducted in a business way. This is true with any occupation and farming is no exception.

The office of markets, which is under the supervision of the United States department of agriculture, has selected Kansas City as a point for research of general marketing conditions.

The National Association of Carlot Live Poultry Shippers and the Southern Poultry and Egg Shippers' Association convention is scheduled to be held in Louisville, Ky., October 20 and 21.

Growers of oranges and grapefruit in the Isle of Pines are urging that crates bear the stencil "Isle of Pines Fruit," also that packing associations make certain that only good fruit be allowed this privilege.

Systems of efficient farm management that will prove adapted to all farms do not exist. There is no universal tonic that will help out all run down farms. The successful system must be developed to meet conditions.

London is a great market for American skunk skins. In 1911 over 2,000,000 skins of this animal were exported to London. We receive a good number of them back after they have been made up abroad and labeled "black marten" or "Alaska sable."

Apple exports to Liverpool, London and Glasgow have been running about 2,000 barrels less per week than last season. There is a fair market for fancy, well colored fruit, but green fruit is almost unsalable. America is the only country now shipping fruit into England.

A person cannot be working for a concern and working against it at the same time, and no employer pays salaries for the latter kind of work. If one is not satisfied with a position, it is much better to go out and find another than to accept pay for half-hearted service.

A farm produce exchange is provided for in a bill introduced by Representative Sumners of Texas. The exchange to be established by the Secretary of Agriculture, who shall collect and distribute details of quantity, quality, location, price, demand, etc., of agricultural products.

President Wilson, it is reported, has joined the "Buy a Bale of Cotton Club" by ordering from the head of the organization in Georgia $50 worth of cotton. People throughout the South are joining the movement to take up the cotton crop left over by the European war. Cotton growers talk of cutting their planting in half next year, substituting wheat and other products.

Agricultural News Notes of the Pacific Coast

Northern California

Mendocino's apple show will be held October 27-31.

Ukiah's hop festival was held from the 15th to the 20th of this month.

Gridley expects to have a rice mill in operation for handling the 1914 crop.

Placerville, Eldorado County, has shipped to date 300 carloads of pears, plums and peaches.

The Concord, Contra Costa County, Poultry Association will hold its show October 20-31.

Dairymen of Orland, Glenn County, have organized a cooperative company for the purpose of establishing a creamery, condensed milk factory and cheese factory.

The Siskiyou County Union high school at Yreka will conduct an information bureau for farmers. C. L. Hampton is in charge of the agricultural department.

The sugar refinery at Crockett, Contra Costa County, it is rumored, will be very greatly enlarged to enable it to care for the total raw sugar product of the Hawaiian Islands.

The Sacramento County Poultry Association will hold its first annual exhibition, November 2-7. The Sacramento Valley Fanciers' Association will hold a show at the same time.

Vineyardists of the Lodi section are rushing their grapes to market as fast as possible because of prospects of early rains. The output from this section is expected to reach 2,000 cars.

The Hayward center of the Alameda County farm bureau met for the first time Monday, September 7. Adviser Nixon made many recommendations to farmers and made appointments to visit several of the ranches.

Seventy-five thousand sheep spent the summer on the government ranges in the Coast mountains. The sheep left the high altitudes in fine condition and are now on the winter ranges of the valley. They suffered much while in the mountains from predatory animals.

At a recent meeting of the board of supervisors an ordinance to promote the horticultural interests of Sonoma County was passed by the board. The ordinance provides for the quarantining of all plants, trees, vines, shrubs, scions, cuttings and grafts imported into the county.

United States Agricultural Expert D. W. Working recently concluded an investigation of the operations of the Yolo County farm bureau. Before leaving, the federal expert said that Advisers Hecke and Searles had their work well in hand, and he highly complimented the organization.

The Northern California Stockmen's Association, an organization of cattlemen of Shasta County, is protesting against the formation of Lassen Peak national volcano park, the spokesman for the cattlemen stating that the park, as defined in the Raker bill, would deprive between 4,000 and 5,000 cattle of Shasta County of summer range, which would be ruinous to several stockmen who graze cattle in the volcanic region. It is claimed a like number of cattle in Tehama County would also be affected.

Central California

Farmers of Tulare County are planning a vigorous campaign against the eight-hour bill.

Four hundred men are at work on a 10-mile stretch of road being built in the Hetch Hetchy Valley.

The cannery at Porterville, Tulare County, is now installing machinery to pack olives the coming season.

The monthly report of the Visalia Cooperative Creamery shows a total of $27,000 paid to dairymen during the month of August.

The Associated Raisin Company has brought suit against a number of raisin growers who failed to deliver raisins according to contract.

Twenty-one apple producing counties of California will be represented at the California Apple Show to be held in San Francisco October 1-11.

Between 40 and 50 tons of almonds will be shipped from the Oakdale district in Stanislaus County this season. Growers are jubilant because of high prices.

At Modesto on October 14-17 inclusive, will be held the California Dairy and Stock Show. Several important legislative questions will be discussed at the meetings.

The Fowler Agricultural Club will give a show and band concert for the purpose of raising funds to defray the expenses of one member for a three days' trip to the university farm at Davis.

Dairymen of Fresno County received for butter fat last month $91,688.32, which is about $15,000 increase over average receipts. The increase is attributed to the fine yield of alfalfa this year.

The Tulare County Citrus Fruit Exchange has elected officers for the coming year, as follows: H. C. Carr, president; J. P. Firth of Strathmore, vice-president, and W. E. Sprott, secretary and manager.

Members of the Holt division of the San Joaquin County farm bureau made a visit of inspection to the Van Loben Sels ranch, near Rio Vista, instead of holding the regular meeting. The ranch comprises 3000 acres.

The output of the Tulare cannery, which is nearing the end of its season, will be about 50 carloads. One-third of this amount has already been shipped and it is expected that the remainder will be shipped within the next 30 days.

Work on an olive pickling factory to cover an entire city block will soon be started at Exeter. It is stated the new plant will be the largest and most complete of its kind in the United States, and it is anticipated that thousands of acres will be planted to olives in the foothill section of the county within the next few years.

In fixing the tax levy for the coming year the supervisors of Stanislaus County included an appropriation of $2,000 to employ a farm adviser. The law requires that before the appointment of an adviser by the university 20 per cent of the farmers in the county must organize the necessary farm bureau, in order to make the work of the adviser more systematic and efficient.

Southern California

Satisfactory experimental plantings of rice have been made in Riverside County.

There is much activity in Riverside County, boosting for the coming county fair.

September 28-30 was set aside for the Ventura County fair and San Miguel Day celebration, held at Ventura.

The Chino sugar factory is turning out 3000 sacks of sugar a day. The sugar percentage generally runs higher than last year.

Eleven thousand two hundred sacks of grain was harvested from 1000 acres by a rancher in Kern County, who received $11,000 for his crop.

J. T. Schroeder of the Chino branch of the American Beet Sugar Company declares there will be no shortage of seed in that section for at least two years.

The sugar factory at Chino, San Bernardino County, is turning out 3000 sacks of sugar of 100 pounds each per day. The crop this year is running one ton per acre higher than last year's.

The Fillmore-Bardsdale-Sespe Farmers' Club of Ventura County held a meeting September 14, in the Union high school at Fillmore. The meeting was addressed by County Farm Adviser W. B. Parker.

At the annual meeting of the Rialto Orange-Lemon Association held at Rialto the following officers were chosen for the ensuing year: George A. Brua, president; M. C. Hodge, vice-president; Edgar R. Downs, secretary and treasurer.

An enthusiastic meeting of those interested in the Imperial County fair, to be held at El Centro November 18-21, was held last week. Mr. John F. Manning of El Centro is secretary of the fair association. An automobile show will be held in connection with the fair.

The breeding of ostriches at Arlington Station, in Riverside County, will be discontinued. One hundred of the birds now on the farm will be shipped to San Francisco for exhibition purposes, 50 to San Diego, and the remainder will go to the ostrich farm at South Pasadena.

Articles of incorporation of the Farmers' Union of Arroyo Grande have been filed with the county clerk of San Luis Obispo County. The object of the association is to endeavor to establish a market for the crops grown by its members. Mr. C. A. Cheadle of Berros has been appointed manager.

The Riverside Portland Cement Company was awarded first prize on potatoes, first prize on onions, special first prize on display orange nursery stock and second prize on general display at the state fair at Sacramento. The produce was all raised on land lying adjacent to the company's plant.

Active preparations are being made for the second annual Riverside County fair, to be held at Riverside October 13-17. Premiums to the amount of $10,000 are being offered. Farm products of every description are to be displayed. Date growers of the Coachella Valley have placed some of their choicest fruit in cold storage for exhibition at the fair.

The Coast

Luna County, New Mexico, is working to secure a county farm adviser.

Total shipments of Yakima Valley fruits for this season are 3,543 carloads.

Twelve carloads of fat steers costing $24,000 arrived in Spokane last week from Idaho.

Managers have already been chosen for Portland's rose festival to be held in June of next year.

From Toronto, Canada, comes the report that 50,000 bushels of American wheat was purchased in one shipment.

The Oregon hop market opened up with a rush when 600 bales of the new crop were bought in the Independence section at 18 cents.

The hop yards of North Yakima, Washington, it is estimated, will pay out $150,000 to pickers for some three or four weeks' work.

Two hundred and fifty thousand dollars is estimated by Yakima Valley orchardists as the loss caused by fire blight in that section.

Though beneficial to root crops and pastures, the recent rains in Oregon have hindered to some extent prune drying and hop picking.

The preliminary schedule has been announced for the six days' conference of northwestern fruit growers during the Spokane Apple Show, November 16-21.

Swine breeders of the northwest met at the Spokane Interstate fair and organized the Swine Breeders' Association. L. H. Lindbarger of North Yakima, Wash., was elected president.

A dairymen's organization has been formed at Union, Oregon. It will be known as the Catherine Creek Dairymen's Association. It is the first organization of its kind in the county.

The Horse Heaven Land Owners' Association, controlling 300,000 acres of unirrigated land in Klickitat County, Washington, is endeavoring to interest the interior department in a reclamation project.

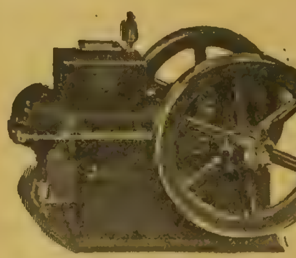
Disbursements to growers of the northwest up to August 31, through the North Pacific Fruit Distributors, aggregated $346,667, according to the figures announced by J. H. Robbins, general manager. Up to the same date a year ago only $32,976 had been disbursed. Business this year exceeded that of 1913 by $313,701.

After ten months of investigation the by-products commission, appointed by the Sixth National Apple Show at Portland last fall, has submitted definite plans. A central organization of fruit and vegetable by-product plants will be formed. Fruit growing sections of Washington, Oregon and Montana are uniting in the plan.

A white fly quarantine order of the Arizona commission of agriculture-horticulture No. 2 prohibits the importation into the state of Arizona of citrus nursery stock from all states bordering on the Gulf of Mexico, Georgia and South Carolina, while a red and yellow citrus scale quarantine prohibits the importation of all citrus nursery stock from the state of California, except from Tulare, Fresno and Imperial Counties.

Doubly Insure Against Drought

By installing a pumping plant equipped with an **ALPHA GASOLINE AND DISTILLATE ENGINE** and an **IDEAL GREEN FEED SILO.**



ALPHA Engines

will simplify your pumping problems.

A big hot spark.

Live Stock and Dairy

OUR LIVE STOCK INDUSTRY

Contrary to all predictions, the number and value of horses, as well as all other kinds of livestock, are increasing in California. There are now in this state approximately a half million horses at a valuation of about $60,000,000, and the importation of pure-bred stock has been greater during the past year than during any preceding year in the history of the state. Of course it must be admitted that the trotting horse, the coacher and the finer harness breeds have not found it profitable to increase their numbers. Drafters are in the best of form notwithstanding the extending use of the tractor.

In dairy products California is yet backward in the production of cheese. While we produce considerably in excess of 55,500,000 pounds of butter annually, we produce less than 9,000,000 pounds of cheese. The value of the butter produced is $18,000,000, market milk $11,000,000, while the total for all dairy products is approximately $34,000,000. According to the census for 1910, the number of dairy cows kept for milk in this state was 464,329, valued at $18,478,076, or an average of $39.80 each.

Sheep

One branch of the livestock industry that is decreasing year by year is sheep-raising. The output of wool in California has decreased from 56,550,000 pounds in 1876 to less than 12,000,000 pounds in 1913. This is explained by the fact that many of the large ranches have been cut up and made into small fruit orchards, also to the fact that the mutton sheep is increasing in popularity.

Hogs

The census of 1910 showed the total number of swine in this state to be 749,642, valued at about $5,000,000. This is one feature of animal industry which is not coming up to its possibilities. The manager of one of the largest packing houses in the state told the writer recently that his concern was securing only some 5 or 6 per cent of its hogs for slaughter from California farmers. This, of course, is under the average, but the pork products imported to the state aggregate millions in value every month. With the cheapest and best alfalfa grown in the world and conditions favoring the swine husbandry, it is to be hoped that another year will see a wonderful increase in the number of hogs marketed by the California producer.

SWINE AWARDS AT STATE FAIR

The California state fair exhibit of swine this year was conceded by exhibitors and judges the best ever brought together at the fair in competition. The champion boars and sows of all classes showed wonderful breeding and careful exhibit preparation on the part of the exhibitors. Several new breeders entered stock in the swine classes and added much to the general high quality of the show.

Berkshires

Boar, two years and over—1, Standard Master, White; 2, Panama Lee, Barrows; 3, Fashion Longfellow, Humphrey. Eighteen months and under two years—1, Improver B., Oak Grove Dairy Farm; 2, Royal Masterpiece

NEEDS MOTHERING, BUT WILL BE A WINNER
The draft horse industry is growing as never before.

farming for *money*

Every good cow at Fairmead brings in around 35c per day cash. 30 cows mean $10.00 cash each day. One acre of alfalfa at Fairmead will support a cow the year round plus some hogs. Two creameries collect the butter-fat, paying the highest prices. Why not start right now farming for money

Feeding Roots: More and Better Milk—Beef Mutton

ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the "Non-Choke Curve Cut." Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

International Motor Trucks Make Farm Life Pleasant

Make an International Motor Truck part of your farm equipment. Make your road trips in from a half to a fourth of the old time. Be ready to make a hurry trip in a hurry. A thirty-mile trip with the International looks like five with horses.

You can run an International Motor Truck at considerably less expense to keep than horses, wagons and harness. Fuel and oil cost less than the feed of a horse. And when the car isn't running it doesn't cost one cent. On hundreds of farms the International has earned enough to pay for itself in a couple of seasons.

Solid tires eliminate common tire trouble. The high wheels give ample road clearance. The simple, sturdy engine has power to spare for any load, and will take the truck everywhere a horse will go. Brakes are powerful—safe on any hill. Springs are resilient and easy. A single lever controls the car, and the transmission gives two forward speeds and reverse.

It will pay you to know all about the International Motor Truck—all it will do for you. Write us for catalogues, facts, full information.

LARROWE'S
MOLASSES-DRIED
BEET PULP

CLEAN — HEALTHFUL
KEEPS INDEFINITELY

LARROWE'S MOLASSES-DRIED BEET PULP is simply the plain beet pulp with beet molasses dried, but on account of its sweetness it is being preferred by many dairymen and feeders—especially those who use it for fattening. It has all the feeding value of the plain, but with the addition of molasses. Horses grow sleek, stock fatten rapidly, hens lay more eggs—when fed Larrowe's Molasses-Dried Beet Pulp.

You certainly can well afford to give this popular feed a trial. Your feed dealer will supply it to you in 100-lb. sacks—and one sack will prove to you its worth.

LARROWE'S DRIED BEET PULP
Just Like Roots
Makes More Milk

THE IDEAL FEED FOR DAIRY COWS

Larrowe's Dried Beet Pulp improves the health and increases the flow of milk. It furnishes more succulence than silage, greater digestibility, an abundance of carbo hydrates—and is just what is needed with alfalfa to make a perfectly balanced ration.

A succulent—palatable—nutritious—vegetable feed—for

—they all eat with relish and thrive on Larrowe's Molasses-Dried Beet Pulp.

ORDER FROM YOUR DEALER

Tell him you want "Larrowe's"—the kind that is always uniform, never blackened or burned. If your dealer hasn't it—tell him to write to us.

Valuable Book—"PROFITABLE FEEDING"—Free

Send for a copy of our booklet "Profitable Feeding," giving valuable information, also instructions for the use of Dried Beet Pulp. Your name and address on a postal will bring you a copy free.

THE LARROWE MILLING COMPANY
607-608 Central Building Los Angeles, Cal.

(A group of Southern California ranchers and investors who bought at Milford last week.)

WHERE can you buy farm land at $30 an acre that immediately becomes worth several times its first cost when placed under cultivation?
WHERE can you buy land at $30 an acre under a gravity irrigation system where the water maintenance should not exceed 30 cents per acre per annum?
WHERE can you secure land at this price that will yield 50 bushels of wheat, and 100 bushels of oats to the acre—alfalfa, 5 tons to the acre, at an average value of $12 to $15 a ton in the stack—400 to 600 bushels of PERFECT POTATOES to the acre year in and year out?

Milford Valley Lands On main line of Salt Lake R. R. Adjoining Milford, Utah. $30 an acre.—Perpetual water right—Water $70 per share. 12 year's time to pay for it if you wish

If you want some of this land act at once—don't be among those who will be too late. Special excursions at homeseekers' rates on Wednesdays and Saturdays from Los Angeles. See our special exhibit of fruits, grains and grasses, also "Milford Valley in Pictures" at the Salt Lake R. R. ticket offices, 6th and Spring streets, Los Angeles.

Raising Colt on Cow's Milk

Can I raise a colt on cow's milk and would it be best to dilute the milk, or how is best to raise a colt by hand?—Subscriber, Bachelor.

You can raise a colt all right on cow's milk. It does not need to be diluted, but might be allowed to stand 12 hours and the cream removed. The colt should be fed several times a day, as the stomach is small. Put some hay and grain where it can reach it, and it will soon learn to eat. When it is five months old gradually reduce the milk and soon stop altogether.

Mule's Foot Hurt

Have a mule colt about six weeks old that was stepped on by a horse and had its hind hoof about two-thirds torn off. It has been that way about two weeks and has proud flesh in it. Will a new hoof grow in the place of the old one, or will the old one grow back, or what is best to do about it?—Subscriber, Bachelor.

Too bad that the foot was not

(Continued on Page 335)

Purebred Registered
HOLSTEIN
CATTLE

Our Advanced Registry of milk and butterfat records show that we have 22 cows each with productions of above 875 pounds butterfat or 1093 pounds of butter for the year. All other breeds together cannot show that number of cows with records of equal production. Of all that is being done for the advancement of the dairy industry, nothing exceeds in value the work of the testing associations. The records made do much to prove the supremacy of the Holstein cow as a milk and butter producer. For facts

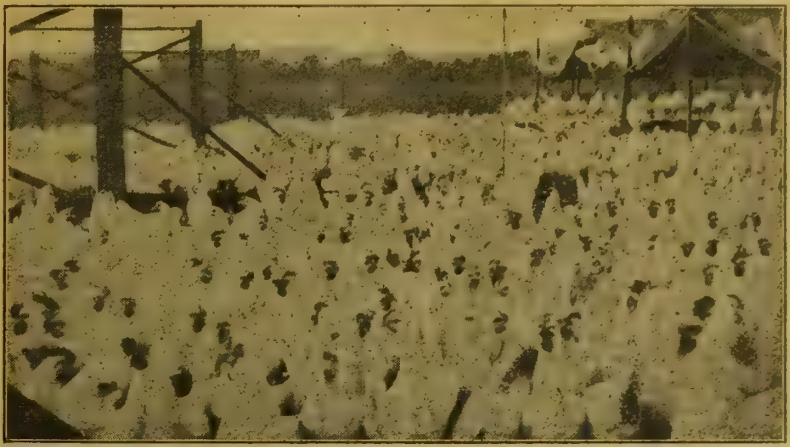
Profit in the Poultry Yard

OUR POULTRY INDUSTRY

With one poultry plant in the state with a capacity of 100,000 chicks monthly, and this only one of dozens of large concerns, it may be seen that California is producing some poultry. The Cultivator recently published a large illustration taken on a ranch with 20,000 head. Now comes report from Inyo County that 400 acres are to be devoted to one poultry ranch that will accommodate at least 12,000 laying hens. This will mean several thousand additional head on the ranch constantly, so that Inyo County may claim precedence over the far northern section in magnitude of single ventures in the poultry industry. Petaluma claims, and rightly, the honor of being the center of the poultry industry of the Pacific Coast. While there are immense ranches there devoted to the poultry industry, the average is five acres, and each five acres accommodates anywhere from 500 to 3,000 chickens. There are others in the same section which will accommodate 30,000 chickens. From that one section there are shipped annually between 10,000,000 and 11,000,000 dozen eggs and close up to 100,000 dozen poultry.

The entire state produced nearly 45,000,000 dozen eggs and 300,000 dozen poultry. The industry has been somewhat discouraged during the past two years because of high prices of feed and because of the large receipts of poultry products from the Middle West and from China. At the present time the importations of Chinese eggs has been stopped because of the war conditions.



A RIVERSIDE COUNTY POULTRY RANCH
The state imports millions of dollars in poultry products. It should produce them. The hen census shows nearly 7,000,000 population.

POULTRY FANCIERS TO EXHIBIT

The San Francisco Poultry, Pigeon and Pet Stock Association will hold another show at the Auditorium, San Francisco, December 8 to 13. The show this year, on account of the increased floor space, will be on a larger scale than ever before. Many new features of interest to poultry raisers will be introduced. Utility and fancy stock from all over the country are to be shown. The exhibit of pigeons, rabbits and children's pet stock will also be large. The judging of these various entries will be in the hands of eight experienced men. C. S. Beyers, the Orpington judge of Indiana, will handle the fowls of that breed.

Cash prizes, cups, medals and useful trophies will be awarded. Much attention is to be paid to dressed poultry this year. Every phase of this business will be displayed. A free sales secretary has been appointed to assist buyers and sellers of stock. No charge for this service will be made. E. J. Talbot, Mutual Savings Bank Building, San Francisco, is the secretary of the show.

LANGSHAN FANCIERS

The Pacific Coast Langshan Club has decided to give certificates of award for first cock, first cockerel, first hen and first pullet at all of the 1914 poultry shows where three or more members of the club are competing. At the show of the Alameda County Poultry Association to be held in Oakland a cut glass sugar and creamer, spoon tray and nappy will be awarded for first pullet, and a silver cup for first cockerel.

PURE BREDS ON NEARLY ALL RANCHES

The Pacific Coast Langshan Club is entering upon its third year of show work. Breeders of Langshans are cordially invited to join. The dues are $1 per year. Write to the secretary-treasurer, M. W. Nicholson, 2204 Vicksburg Avenue, Oakland.

A coat of whitewash on the inside of hen house may not keep mites and lice out, nor disease. But the man who keeps his hen house whitewashed, is also sure to keep the roosts clean and free from mites. By all means, whitewash the hen house on general principles and do it thoroughly.

Every Rancher should own a Western Gas Engine

Announcing the New Model 15

The Model 15 is without exception the most perfectly designed gas engine that has ever been constructed. It is the ultimate realization of our efficient engineering department, whose united effort has been to construct an engine absolutely perfect in every detail. Nothing has been sacrificed from an engineering standpoint. It is a truly remarkable engine—offering no chance for critics. The Bosch high tension magneto and new force feed automatic oiling device are among the more important improvements. Call and see demonstration.

Irrigation and Forestry

IRRIGATION IN CALIFORNIA

The number of farms in California is over 88,000, and nearly half that number, or 39,352, are under irrigation, an increase of 53.3 per cent during the decade of 1900-1910. The largest percentage of land under irrigation in any one county is in Imperial, where 94.6 per cent of all farms are irrigated. Inyo is the next largest with 93.2 per cent. The total ditch length in the state is 21,129 miles, almost once around the earth. With over 1500 reservoirs with a capacity of 743,780 acre-feet, the pumping capacity of the state is 5,275,298 gallons per minute. The average cost of irrigation enterprise in the state is $15.37 per acre and the average operation and maintenance cost is $1.54 per acre.

INTERNATIONAL IRRIGATION CONGRESS

To bring every possible acre of idle and apparently useless land under the plow is the aim and object of the International Irrigation Congress which this year will hold its convention in Calgary, October 5 to 9. During the past few years there have been millions of acres of land brought under cultivation by the scientific application of water, and the problems that confront the irrigationist are rapidly being solved by the information disseminated at the annual conventions for the discussion of matters that affect the settlers. These questions are vital to the prosperity of the country.

Governments of the United States and Canada, as well as a number of foreign countries where irrigation is well developed, are giving of their best and most experienced men to this convention in Canada this year, thus backing up and aiding the noble work which this organization has voluntarily undertaken. These men will give of their valuable experience to those who are actually and daily experimenting with the problems of irrigation in the reclamation of idle lands, and thus assist to accomplish the aims and objects of the organization as expressed in the motto "Make easy the path of the home-builder."

Irrigation is one of the chief works of an advanced civilization. The population of the world is advancing more rapidly than the production of food stuffs, and the work of the Irrigation Congress is a distinct effort to perform its share in the development of this civilization.

APIARIES INCREASED IN VALUE IN 10 YEARS MORE THAN 100 PER CENT

There is now over a million dollars invested in bees in this state by 6869 beekeepers, who own 200,718 colonies.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Salt for Fowls

Kindly tell me why salt is seldom recommended in chickens' food and never in turkeys'? Why would it not be good for both?—J. M. P., Pacoima Hills.

A little salt is very good for fowls, but too much is injurious. Many dry mash formulas do contain a small amount of salt, but the objection to using it in dry mash is that it cannot be evenly distributed and some fowl is liable to get too much. When salt is to be fed it is much safer to put it in a wet mash where it can be dissolved and thoroughly distributed. The proper way to use it is to dissolve about a tablespoon in a gallon of water, and after it is dissolved mix in the ground grain and other ingredients. Salt is poisonous to ducks, and turkeys certainly do not need it, for they never get it in their natural wild state. I always salt a wet mash for chickens about as I would salt mush for my own family, but I have never thought they needed it. It simply makes it a little more palatable.—J. A. K.

Feeding Pigeons

Will you also tell me what green stuff pigeons will eat that is good for them? Is a mash good for pigeons? —J. M. P., Pacoima Hills.

This question was submitted to the manager of one of the largest pigeon lofts in the west, and he replied: "We feed wheat, milo maize, hemp and one or two other small hard grains, never any ground grain or mash. It is not good for them. In place of green feed we give once a week dry Canadian peas. After these enter the crop they are softened and answer the purpose for which green feed is used.—J. A. K.

Slugs

There are some little soft bugs on my pear trees. They are green and shaped like a nipple, from one-fourth to one-half an inch long. They eat the green off the leaves, leaving only the fibre.—Subscriber, Anaheim.

The description is somewhat indefinite, but we would guess that this is an infestation of slugs. If the soft-bodied bug is slimy and sluggish in movement it is probably the ordinary slug, which can be easily controlled by scattering dried air-slaked lime, ashes, or even road dust, over the trees. If it is not the slug, but is a leaf-eating insect, then spray with Paris green or some other arsenical.

The New

Steel King Motor Plows

are creating a SENSATION among the California Farmers

Because:

They are actually doing just what they are represented as being able to do, and standing up to the job

- At Sawtelle one is Running a Thresher This Week
- Near Tulare one is about to Mow a Large Field of Alfalfa
- Near Porterville one is about to Start a Big Plowing Job
- Near Los Angeles one is Operating Upon a Track as a Locomotive Hauling Long Grape Trains

All at a fuel cost of 4 cents per hour

We cannot too strongly urge the progressive farmers to investigate this new development

8 Horses, $1050

CALIFORNIA

Written for California Cultivator

Del Norte to San Diego,
  Lake Tahoe to The Gate,
Mountain and valley and headland,
  Say, do we love our state?

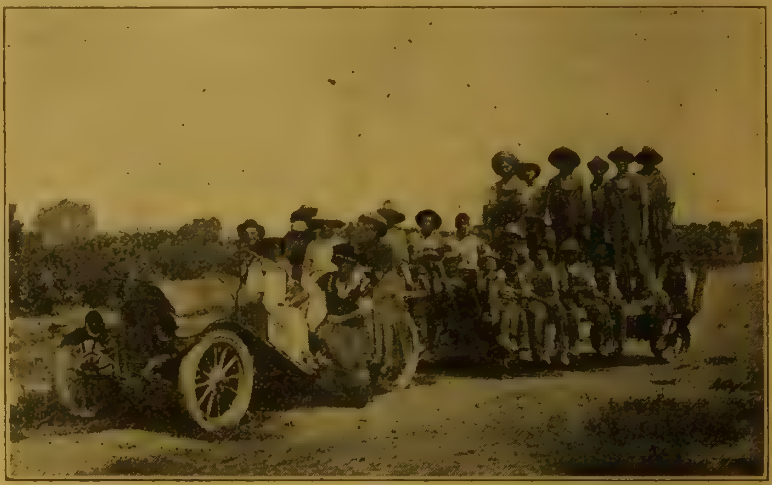
We that were born to her glories,
  We that have come of late,
Alike are we lovers and boosters—
  Yes, we are proud of our state.

In this year of her jubilation,
  When ocean and ocean mate,
Let us sweep and garnish and deck her,
  And make her our spotless state.

Del Norte to San Diego,
  Lake Tahoe to The Gate,
Queen of our hearts, our home land,
  California, our Golden State.

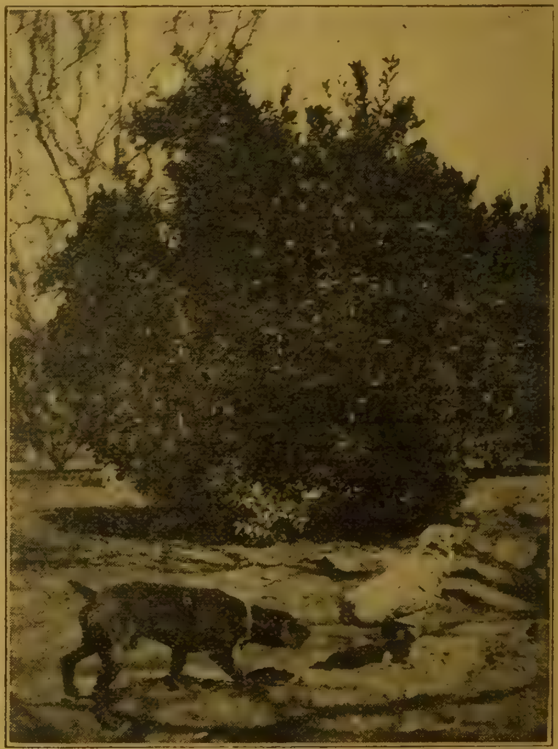
PRIZE PHOTOS FOR OCTOBER

We are surprised that with the 42 photos sent for the September contest October should go far better with a total of "57 varieties." From the 57 photos presented to the judges the two prize winners appearing on this page were chosen. We never had such a collection of good photos entered in a contest. There was hardly a poor one in the entire lot, though several lacked sufficient clearness to answer for engravings. We ask competitors for the November contest to make a point of developing plates with as much contrast as possible. Do not overtime. California light is wonderfully actinic.



CARRYING GRAPE PICKERS TO THE VINEYARD
First Prize Photo by Hirsehler Brothers, Reedley.

The first prize photo shows method of transporting workers from town to the orchard. It is a clear and effective photograph. The second shows skillful posing of a couple of farm pets. We imagine both sides are hoping for reinforcements. The picture creates a desire for a second view, or rather for a movie film which will throw further light on the very pointed discussion.



WAR—BOTH SIDES HOPING FOR REINFORCEMENTS
Second Prize Photo by Blanche Tiede, Santa Ana.

Another striking photo sent from the extreme northern end of the state was of a dog in the air, jumping at a cat on a post. We cannot even refer to the large number of photos sent, but will give reproductions of many of them in later Cultivators.

Regarding the November contest, we wish to call attention to a slight change. Two dollars will be paid for the first prize-winner, $1.00 for the second, and then for all photos which are accepted and retained a six months' subscription to the California Cultivator will be given. We will only keep photos from which we can make clean-cut engravings. This means that everyone who sends a photograph which will answer for an engraving will receive a prize. Photos for the November contest should be in this office by Thursday, October 29.

BOOSTING FOR CALIFORNIA

This is the day when all the newspapers of the state are boosting for California. Not that we don't all do it 365 days in the year, but this is a special extra, a sort of California Thanksgiving, when we count up our blessings and our assets for the great exposition year.

Nature, we know, has done her utmost for our state. Now what can we do to make her more attractive? We expect visitors from all parts of the world, and every one of us is planning to see the great expositions and to travel over the new highways to view the rest of California. We want to make our particular section beautiful both for the visitors from afar and for our neighbors.

Improvement clubs are pushing clean-up and planting campaigns in every section. Let us all join ardently and energetically in the community work; but most of all, let us make our own little individual corner a spot that we can show with pride.

THE NEXT PRIZE CONTEST

Don't forget the next prize contest.

Two Dollars

Two dollars in cash will be given for best short article describing a child's Hallowe'en party, a dinner, ride or any other form of Hallowe'en entertainment, giving, of course, that most interesting part of any party, "the eats."

One Dollar

Send your favorite recipe using walnuts. For the best will be given one dollar in cash.

Cultivator for Six Months

To all, not prize winners, whose articles or recipes are published, will be given six months' subscription to the California Cultivator. Remember, all suggestions should be mailed to California Cultivator, Los Angeles, by October 8.

Articles and recipes will be printed in the issue of October 15. Already a fine lot of recipes have come in, but we want more. Send us yours. Also try for that two dollars by sending in an account of a jolly Hallowe'en party.

A number of suggestions for the November contest have been received.

What would you like to have for the subject of that contest? Tell us when you send your articles.

HELPFUL THINGS

Written for the California Cultivator
By A. M. H.

One of the most helpful things in the home is a good cleaning fluid to use for cleaning men's and boys' clothes, dress skirts, carpets, etc. An excellent cleansing fluid for goods of any color or quality is made as follows: One-half ounce each of ether and spirits of wine, two ounces each of castile soap and ammonia, two and one-half quarts of rain water. Shave the soap fine and dissolve in the water, and when just warm add the other ingredients and bottle. For cleansing use one teaspoon to a pint of water, and clean water to rinse out the soap.

It is a good plan to keep a package of absorbent cotton in one of the sideboard drawers, as a bit of cotton applied instantly when grease of any kind is spilled on a garment will often remove all traces of the stains. There is nothing more useful in the kitchen than common baking soda. An excellent and cheap baking powder is made with four ounces each of soda and cornstarch and eight ounces of cream of tartar. This must be well mixed and sifted.

Soda added to the water for scrubbing the bare floors and tables makes them white and saves labor, and tinware is brightened by rubbing with soda and then with a piece of soft, dry flannel. The nickel plate of the stove may be brightened with soda and ammonia, using a woolen cloth and polishing with a dry one. And use hot soda water for a greasy sink. There is nothing more useful in the home than a bottle of strong boric solution. This can be weakened as desired. The strong solution is prepared by putting two heaping tablespoons of boric powder in a cup and making into a paste with hot water. Then this is stirred in a quart of hot water and put in a bottle ready for use. A little of this solution applied to small cuts and wounds will often cure them without any further trouble, and when you have a bottle of this boric solution you have one of the best home remedies for weak eyes, and it makes an excellent wash for the mouth and throat and for all kinds of skin troubles. It is also excellent as a douche for bowel troubles. And where germs are present this solution will tend to destroy them.

Light, Cook and Heat with Aero-Gas

You can cook with gas even if there is no Gas Company in your town. The Aero-Gas self-generating plant, made expressly for private country homes, furnishes you with inexpensive best quality gas—either for cooking or lighting.

With the Aero-Gas system, you can use ordinary quality automobile gasoline, which you can get anywhere.

No danger, no odor, no delay, no bad air to breathe, because Aero-Gas takes no oxygen from the room.

Positively non-explosive should it escape into the room—you couldn't light it even if you tried to! Non-injurious to animal and plant life.

A postal will bring descriptive booklet. Send for it today.

Deafness

From All Causes, Head Noises and Other Ear Troubles Easily and Permanently Relieved!

Thousands who were formerly deaf, now hear distinctly every sound—even whispers do not escape them. Their life of loneliness has ended and all is now joy and sunshine. The impaired or lacking portions of their ear drums have been reinforced by simple little devices, scientifically constructed for that special purpose.

Wilson Common-Sense Ear Drums

often called "Little Wireless Phones for the Ears" are restoring perfect hearing in every condition of deafness or defective hearing from causes such as Catarrhal Deafness, Relaxed or Sunken Drums, Thickened Drums, Roaring and Hissing Sounds, Perforated, Wholly or Partially Destroyed Drums, Discharge from Ears, etc. No matter what the case or how long standing it is, testimonials received show marvelous results. Common-Sense Drums strengthen the nerves of the ears and concentrate the sound waves on one point of the natural drums, thus successfully restoring perfect hearing where medical skill even fails to help. They are made of a soft, sensitized material, comfortable and safe to wear. They are easily adjusted by the wearer and out of sight when worn.

What has done so much for thousands of others will help you. Don't delay. Write today for our FREE 168 page Book on Deafness—giving you full particulars.

Citrus Fruit Market

LOS ANGELES, Sept. 30, 1914.

A statement has been published that the exchange has sold its fruit on an average for all grades of all kinds of fruit at $1.71 f.o.b. The enemies of cooperation have taken up the statement, one paper even giving place to a communication in which the writer said that Washington navels had sold for $1.71 f.o.b. and asked why the growers had not secured more. The statement was simply one which the exchange issues every year and covered all grades of all fruit, including lemons, which sold for a time at very long prices.

Oranges as a rule have done fairly well this season considering depressed financial conditions and an immense crop both in this state and Florida. At the present time the market is steady and sales are being made at fair prices. There are perhaps 2000 cars of Valencias yet to go.

There has been no material change in the lemon market.

Shipments

Shipments of oranges to date since November 1, 1913, from Southern California, 37,047 cars, lemons 2,746, total 39,793. To same date last season, oranges 13,270 cars, lemons 2,156, total 15,436. Total shipments of all citrus fruits two years ago, this date: 34,837.

NEW YORK, Sept. 28.—Twenty-one cars Valencias sold. The market is strong on Valencias, with prices 10 to 20 cents higher. Market 25 cents higher on lemons. Weather fair.

tions of the county, and the county must bear office and other expenses, the federal fund being drawn on only for salary of the adviser. The counties which have so far taken advantage of this law, and their advisers are as follows:

Alameda, Walter Nixon, College of Agriculture, Berkeley.
Humboldt, A. H. Christiansen, 2436 F. St., Eureka.
Kern, Roland B. Mack, Bakersfield.
Madera, Thos. C. Mayhew, Madera.
Napa, H. H. Baade, Napa.
San Diego, Jas. A. Armstrong, Court House, San Diego.
San Joaquin, Frank Lyons, Chamber of Commerce, Stockton.
Ventura, Wm. B. Parker, Ventura.
Yolo, N. P. Searles, Woodland.

VETERINARY

(Continued from Page 328)

properly cared for soon after the accident. The old hoof will not grow back and all the loose parts should be carefully removed. Then wash the foot clean and wrap it with surgeon's cotton and cover with a bandage. Before applying it to the foot the cotton should be soaked in a solution of permanganate of potash, one part to 100 parts of water. This treatment should be repeated once a day until the proud flesh disappears. With proper care from the first a perfect new hoof probably would have grown. Now you will get a new hoof, but it may be slightly deformed.

SILOS AT EXPO.

The De Laval Dairy Supply Company have erected on the Panama-Pacific Exposition grounds a 16-foot by 35-foot 140-ton capacity Ideal Green Feed Silo, the first of six silos that are to be used by the Exposition Company. These silos are to be filled with corn ensilage. This Ideal Green Feed Silo is the first completed working exhibit on the exposition grounds. This fact in itself demonstrates that the De Laval Dairy Supply Company, who were the pioneers in the introduction of the commercial silo in California, are a progressive and up-to-date concern.

UNPREJUDICED.

"How many people are there here, Pat?" queried the Englishman of an Irishman in Montreal.

"Oh, about a hundred thousand."

"Why, I thought there were over half a million?"

"Well," said Pat, "there is—if you count the Frinch."—Canadian Courier.

PIPE PIPE PIPE

Last chance to buy Aqueduct pipe. Prices reduced to close out this month the small amount left. Over 150,000 feet sold in last 4 months. This is good, clean pipe—used only for clean water purposes along the famous Aqueduct. Just as good as new pipe—and price very much less. Prompt shipments to any railroad station. Mail or phone your orders immediately, as this opportunity will not last. AQUEDUCT PIPE CO., 1327 West 7th, Los Angeles. Phone Wilshire 1315. Sizes left: 1-inch, 2-inch, 3¼-inch, 3½-inch.—Adv.

SILOS

Silos have been used in the eastern and middle states for the past 25 years, but their extensive use has been in the last ten years. Prior to that the growth of the silo idea was slow, due largely to the experiments which silo users made. They started in by digging pits in the ground and burying the silage. This left it open to the operation of frost, and the result was very poor. They then built pits, lined them with concrete and extended them either with concrete or with staves above the ground. This style of silo was more successful than the first one, but still open to a great many objections. It usually cost more to pitch the silage out of the hole dug in the ground than the proper form of silo above the ground would cost them originally. They also had a leaky point in the middle of their silo, which caused a great deal of spoiled silage both above and below that point.

The next step was the construction of what is known as "homemade silos." Almost every agricultural experimental station bulletin and a great many of the rural papers contain voluminous instructions as to how to construct a homemade silo for little or nothing. Many farmers have tried this to their sorrow. It is possible for an expert farmer to build a homemade silo, but when he gets all through, if he has a successful one, he may have spent more money than it would have cost him to buy a silo already built from a factory. The great factories that are now manufacturing silos build them by the hundreds, have expert men doing the same thing every day, which renders them more expert, and in general applying what is called "economy of operation" to the manufacture of the silo. In this way they can manufacture a better silo, include a profit for themselves and still sell it to the consumer for as little or less money than he can put up one of the so-called "homemade" variety. The homemade silo manufacturer is at the mercy of the local lumber dealer, whose lumber prices are invariably higher than those of the manufacturer of the factory silo. He is then hampered by amateur help and by a lack of experience such as the expert in a factory naturally acquires through doing the same thing every day.

The history of silo progress in Kansas, Nebraska, Iowa, Illinois and Ohio is repeating itself in California, and the result will probably be the same—namely, that the farmers and stockmen will cease experimenting with crude, homemade silos and turn to the factory silo. The only homemade silo that is at all effective is the concrete silo, and this is expensive. As the use of silos is increasing in California to a tremendous extent, it would pay the prospective users of silos to study thoroughly the history of the so-called "homemade" silos before experimenting themselves; also to apply the ultimate cost as against the cost of a factory-made silo which is guaranteed and effective from the start.

The J. H. Hale—America's Greatest Freestone Shipping Peach

Firm as a Cling, Yet Perfect Freestone. Round, Holds Shape. Unexcelled for Canning. Rich, Meaty Flesh, Weighs 12% More Than Elberta, ⅓ to ½ Larger, Ideal for Drying. Late Bloomer.

The Peach for Western Growers

Here is a peach that will ship immense distances. A peach round in form and regular in shape, that doesn't "rag out", or discolor syrup, matchless for canning. A peach of sweetness, heaviness and density of flesh admirable for drying. Study these qualities:

Size, 1-3 to 1-2 larger than Elberta
Weighs 12% more per bushel
Tight skin, *practically fuzzless*
Golden yellow color, carmine blush
Solid and firm. Won't "squash down"
Longer keeper, better shipper
Globular shape for canning
Brilliant clear syrup
Better flavor than Lemon Cling
Heavy, dense flesh for drying
Large size, cheapest to handle
Ripens early—hangs late
Late bloomer, for frosty regions

A few peaches have *some* qualities best fitted for Pacific Coast conditions. But here is a peach that embraces them *all*. Find out more about the amazing J. H. Hale. Send for the catalog. Get posted — NOW.

What a California Expert Thinks

"The J. H. Hale is a very heavy, firm-fleshed peach—coarse fiber almost absent. Flesh solid yellow to the pit-wall, no excess of red at pit and no cavities around it. A variety that should prove of exceptional value in this state. If it persists in being as much larger than Elberta as is claimed it will be hard to hold in one hand in California."

Prof. E. J. Wickson, Dean College of Agr.
University of California

Be First In Your Section

As an orchardist looking for most profitable fruits, there is a golden opportunity for you in the J. H. Hale Peach. Read the complete story and description in our catalog. Our supply of J. H. Hale peach trees is limited. To get your trees you must *order early*. Ask about our special June-budded J. H. Hale peach trees for large planters.

Genuine Delicious Apple—Growers' Prices

You who have wanted genuine Delicious can now get them, extra size, extra grade, with the famous William P. Stark quality, direct from our nursery and at nursery prices. Write for catalog showing complete list of tested, profitable apples.

What Mr. Hospers of Los Angeles saw *in* Milford Valley

THE following letter was written by a practical farmer, Mr. P. Hospers of 3015 Budlong avenue, Los Angeles, who has just returned from a thorough investigation of Milford Valley lands. Mr. Hospers was kind enough to permit us to use this letter which was written to a friend (F. P. Gallagher) of Armour, S. D. This is a practical man's opinion of a practical farm land offering. If you are in the market for the best fruit, potato, grain and alfalfa land in the west—read this letter carefully.

Los Angeles, Cal., Sept. 28, 1914.

F. P. Gallagher,
Armour, S. D.

Dear Friend:

I want to tell you about my trip to Milford Valley, Utah, last week. I found one of the finest valleys I have ever seen, nothing like it in South Dakota, Montana, Colorado or Texas, and you know I've been all over those places, having bought and sold land there.

These Milford lands have an extra fine soil and plenty of the best water, mighty cheap, too, for this western country. It is a fine fruit, grain and stock country. Saw wheat that threshed 55 bushels to the acre; saw oats 100 bushels to the acre weighing 55 pounds to the bushel. Saw alfalfa fields that cut 3 tons to the acre and they cut it three times, so you see they got some hay, and it is of the best quality. Saw fields of potatoes that will go 500 bushels to the acre. I saw some of the finest hogs and cattle and I know that is what you like. Climate is just right, nothing like it in the middle west. A man can work outside every day here. Milford is a live town of 1500 people and has a pay roll of $50,000 a month. These lands are from two to six miles from the center of town. The railroad is the main line of the Salt Lake. You asked me several times to let you know when I found a good place. I am sure this is just what you want. You had better come at once and see. I expect to move to Milford in the spring. This land is selling very fast and I would advise you to act quick. The cost is only $30 per acre and the water right is sold at $70 per share, sold on 12 years' time, if desired. This is the cheapest land of this class I've seen out here. With best wishes, I am

Yours truly,
P. HOSPERS,
3015 Budlong Ave.

Vol. XLIII No. 15 LOS ANGELES: THURSDAY, OCTOBER 8, 1914 One Dollar Yearly

Potato Growers Convention at Stockton

Cultivator Representative Hears Discussions at Convention and Observes Potato Growing Conditions in California's Largest Potato Growing Section.

The West Coast Potato Growers' Association was born at Stockton at the meeting of the emergency potato convention, September 26. State Horticultural Commissioner Dr. A. J. Cook was elected president and William Garden, county horticultural commissioner of San Joaquin County, was elected secretary. An executive committee of five is to be appointed by the president later.

Included in the territory of the association are California, Oregon, Washington, British Columbia, Idaho, Nevada and Utah. This West Coast Association will probably affiliate with the National Potato Association, which meets in Lansing, Michigan, December 2-3, 1914, and in San Francisco in 1915.

The emergency convention was a big success both in point of interest and attendance. It was called to discuss the potato troubles which are causing difficulty in the interstate shipment of potatoes.

Stockton was selected as a meeting place because it is in the center of the largest potato-growing district in California—not because there are more kinds of diseases or more trouble from diseases than in other sections. Rhizoctonia, fusarium, tuber moth and eelworm are widespread and a general warfare must be urged against them.

Friday, September 25, was devoted to a trip through the island district on a river steamer. Over 100 made the trip. The meetings were held Friday night, Saturday morning, afternoon and evening.

Dr. J. Appel, a distinguished bacteriologist and pathologist from the University of Berlin, Germany, and Dr. J. Westerdyke of Amsterdam, Holland, a lady who is at the head of experiment station and bacteriological work in that country, were in attendance and made many valuable suggestions. Dr. W. A. Orton, plant pathologist, and William Stuart, horticulturist of the United States department of agriculture, came across the continent to take part in the discussions; State Horticultural Commissioner T. O. Morrison of Washington and E. A. Roberts, president of the State Horticultural Society of Oregon, were there, and the University of California and the state horticultural commission were well represented.

The delta region, lying between the Sacramento and San Joaquin rivers, comprises about 300,000 acres of rich peat and sediment land that has been reclaimed from overflow by a system of levees. The potato is the big money crop and has been grown most largely. Certain factors which are essential to the successful growing of potatoes everywhere in the world have been overlooked by the farmers in the delta, as they have elsewhere, with resulting troubles and decreased yields.

The lands in the Stockton district are farmed principally by tenants who have no interest in the future of the land or a permanent agriculture. It was urged by Col. J. P. Irish that owners bring about the better farming methods necessary for successful potato growing, not only here, but anywhere.

The discussion of the problem naturally classified itself under the following heads: Soil and rotation, irrigation, seed selection and inspection, storage of seed, and diseases, and these subjects will be taken up in their order.

Soil and Rotation

A rotation of crops is imperative for the growing of potatoes continuously, and this rotation is best if it is one that requires livestock to utilize a part of the crops and furnish animal manure for fertilizer. Just what rotation is best for any locality, and for the delta in particular, is a problem that must be worked out. The government and state have an experiment station at Middle River, in charge of W. V. Shear, assistant horticulturist, United States department of agriculture, at which this and other problems are having attention. When first reclaimed these light peat lands, the product of decayed tule and other water plants, are frequently sour, and are very light and open. It is the custom in this country to plant potatoes the first three years, then to rotate with barley until yields are greatly reduced. It was pointed out by Dr. J. Westerdyke that in Holland the land is first cropped in oats, clovers and various grasses, and often pastured for three or four years before it is considered that it is in fit condition for potatoes. During this period lime at the rate of one ton or more to the acre is applied to correct acidity. Then the potato crop is grown once in three or four years in rotation with grasses and other vegetables. Commercial fertilizers are applied freely to potato lands in Europe.

Irrigation

A constant supply of good water during the entire growing season is essential to the growth of the potato. In the delta peat lands that are very wet in winter, ample irrigation in summer is quite as important as anywhere else. It was pointed out by experts and growers that where water takes up vegetable matter and other impurities readily it is important to provide ditches that will permit such

(Continued on Page 347.)

Sugar Beet Culture

Percy L. Edwards Writes for Cultivator Readers as to Cultural Practice With Sugar Beets in California

The farmers of Tulare County in the San Joaquin Valley are demonstrating that sugar beets may be produced in paying quantity in this great valley beyond the influence of the sea breeze. In the Live Oak section about Visalia the best results have been obtained so far. Early planting of seed is found to be of vital importance in insuring a good crop. The natural rainfall must be depended upon to produce the crop in this section until some system of irrigation, other than flooding, is devised. Flooding fields of growing beets is at best risky and many fields have been practically ruined in this way. As yet the growing of sugar beets in the San Joaquin Valley has not passed beyond the experimental stage.

So far as the writer is aware no organized effort has been made to determine the question of sugar beets being a paying crop in this valley, except at Visalia and the Tulare Lake district. At Corcoran several years ago a very good beet sugar mill with a capacity of 600 tons was erected. This mill has never had a fair trial. It has been tied up in a legal controversy and remains inactive. The Visalia plant is a 300-ton mill. That is, it requires that amount of beets to feed the mill every 24 hours. For several years past the Visalia mill has remained idle on account of being mixed up in the affairs of the Corcoran concern. Last year a new company took over the plant and asked the farmers to cooperate with them in the effort to make the production of beet sugar a profitable industry to both farmer and manufacturer.

The Visalia factory has just completed its campaign, producing about 20,000 sacks of fine granulated sugar. Ten thousand tons of beets were sliced to produce this result. A large amount of crude molasses is in storage to be sold later on to manufacturers of stock foods.

These figures of the sugar plants' operation are perhaps of little interest and importance beside the figures showing what the farmers of this section did to produce this result. It is well known that Tulare County ranks very high as a deciduous fruit section of California, as well as citrus. The writer found in some instances farmers raising a crop of sugar beets between the young trees of their peach, prune and plum orchards. They were giving their young trees splendid cultivation and at the same time producing a good crop. J. N. Enlow has grown a crop of beets for a number of years past and always between his young trees. The past season he harvested 11 tons per acre and received from the factory after factory deductions, $42.50 per acre.

Edward Brecht is cultivating a young orchard of prunes. This orchard, together with some other land, making about 20 acres, was seeded to sugar beets this season. The tally at the factory showed a credit for Mr. Brecht of nearly 250 tons. On 16 acres of young orchard, R. K. Ogden harvested 171 tons. The average price paid to growers this year may be placed at $5 per ton. In any figuring of profits in the above cases it should be kept in mind that the growers used the beet crop as a secondary crop and cultivated and prepared the land themselves.

On about 60 acres of land in this same district, T. J. Murray of Visalia, harvested nearly 1000 tons of beets. Some of his land produced over 20 tons to the acre. He flooded his land thoroughly before plowing last spring. Indeed, it would seem from the condition of the beets when harvested and tested at the factory that probably there was an excess of moisture in this land which was well supplied from irrigation ditches. Where there is seepage from these open ditches there is apt to be too much moisture at a time when the beet root is maturing and taking on sugar. In consequence the beet is kept growing instead of ripening.

The firm of Riggs and Oldermeyer engaged quite extensively in sugar beet raising the past year. One field of 50 acres near Visalia produced 705 tons of very fine beets. Ten dollars an acre was paid for the use of the land. On what is known as the Bliss ranch, six miles south of Visalia, this same company harvested a paying crop from a very large acreage.

One lesson was learned by the beet growers of this part of the state which they will do well to heed. There must be early planting of seed to insure the maturity of the roots before the hot days of June and July. Some losses were suffered this year on that account. If the drouth is abnormal the beet roots are shriveled in the burning sun. December is none to early for beet seed planting in this section and planting should be all done with the month of February.

To produce an acre of beets will cost, depending on conditions surrounding the particular case, from $28 to $40 an acre, in some cases a little more. But in the section of which we are speaking, where operations are carried on in young orchards, the cost account is discounted by the benefit to the orchard.

The sugar beet sections of California are found in the old grain fields of the state. While grains are still produced on these lands in certain sections growers are coming to realize the fact that grain crops are no longer profitable, because of reduced yield. Sugar beets and beans are crops of a later day and more profitable to the grower. Beans are a rival for favor of the grower. The little expense of growing beans as compared with sugar beets has made this crop a strong rival. But while the figures show that the cost of producing a crop of beans is under $10 per acre, the value of this crop per acre on the average is not much over $40. To be sure, on some of the rich soils of Ventura and Orange Counties much larger yields are produced some seasons. If a comparison is made with grain production, wheat, barley and oats, the difference in favor of the sugar beet crop will be

GREY FUNGUS GUMMOSIS OF LEMON TREES

Written for California Cultivator

By H. S. Fawcett

In the California Cultivator for August 6, 1914, the writer took up some questions in regard to the brown rot gummosis, the one which may start either on lemon or orange trees (more often on lemon) near the soil and which kills the bark rapidly clear through to the wood on trees of all ages. The remedy for this brown rot form was to cut out the diseased bark and treat the wound and entire trunk with Bordeaux paste. In this article, the writer will attempt to answer questions that have come up in regard to another form of gummosis which is found almost entirely on the bark of lemon trees older than ten years, and never as far as known on orange bark. This and the brown rot form of gummosis were described and illustrated by the writer in the Monthly Bulletin of the state commission of horticulture, volume 2, page 601, August, 1913. This second form of gummosis has been found to be due to a fungus known in the packing houses as the grey fungus, grey mold or Botrytis. There is still another form of gum disease, the scaly bark of orange trees, questions about which will be taken up later. The grey fungus (Botrytis) gummosis occurs on thick bark on lemon trees only and usually in the coast regions. It differs from the brown rot gummosis in killing the outer part of the bark on these older lemon trees much in advance of the inner. The writer has never seen it on trees younger than ten years old. An area of bark, usually small, will be found killed through to the wood, but surroundng this a much larger area where the outer bark has been killed and the inner bark is still alive. The problem in this case is to save as much bark as possible and yet get out the bark that is killed to the wood and prevent any further bark from being entirely killed.

At the Limoneira ranch, where this form is common on older trees, the areas that are dead to the wood are cut out, but beyond this outer diseased bark only is scraped off, leaving the inner bark attached. The outer bark is scraped off with a tool made by curving one end of a piece of steel about the shape of a large flat file to a semicircle, sharpening one edge and setting it about two and one-half inches from one end of a ten inch handle at an angle of 60 degrees. (See illustration in Monthly Bulletin, state commission of horticulture, August, 1913.) Then the cut-out and scraped area as well as the entire trunk is painted with the Bordeaux paste, the formula and instructions for making which were given in the California Cultivator for August 6. The grey fungus gummosis and the brown rot gummosis may often occur together in the same grove or on the same tree. The scraped bark will crack, and gum will usually ooze out for some weeks after treatment. This is to be expected and need cause no alarm if the inner bark at the edges dies no further.

Then there is a cracking and loosening of the bark on old lemon trees that either accompanies or is independent of gum disease. This usually first appears on lemon trees about 15 to 20 years old or older. The Eureka variety seems to show it earlier than the Lisbon. It is not yet known certainly whether this is a condition through which old Eureka lemon trees naturally pass or whether a fungus which attacks the outer bark may be a causal agent. When the bark is first cracking and loosening, the tree usually appears "out of condition." The old cracked bark helps to encourage gum disease, especialy the Botrytis form. If any of the gum diseases are found in connection with it, I would suggest scraping off as much of this old cracked and loosened outer bark as possible and painting the trunk with the Bordeaux paste or a strong solution of lime sulphur.

PSOROSIS OR SCALY BARK OF ORANGE TREES

Written for California Cultivator

By H. S. Fawcett

This is a bark disease on the trunk or larger limbs of orange and pomelo trees. I have never seen it on lemon trees. There is, however, a cracking and loosening of bark in long strips on old lemon trees that is evidently different. This was mentioned under grey fungus gummosis.

Scaly bark manifests itself by the outer bark being broken into scales and pushed up over areas varying in size from an inch to a foot or more in diameter. It begins in a very small area in which simply the outer bark dies, hardens and is pushed off apparently by the formation of new tissue underneath. This, for convenience, may be called the first stage. This goes on from year to year, sometimes very slowly, only an inch or so each year, for several years before an area of any importance is formed. If detected at this first stage it may be easily stopped. Experiments have shown conclusively that these beginning areas can be cured successfully by cutting out all affected bark and treating the wounds with Bordeaux paste, lime-sulphur solution, or good fungicides that are not injurious to bark tissue. As these small areas slowly enlarge from year to year they spread entirely around the trunk or limbs and considerable gum begins to form. New bark constantly forms underneath as the old is cracked off. This last may be known as the second stage of the disease. It is usually in this condition, or even in the third stage, described further on, before the

CITRUS TREES

Buy from the largest Citrus Nurseries in the World

as. Cal. U.S.A.

grower's attention is first called to it by some slight effect on the foliage. All the bark on affected areas that have been allowed to go so far as this second stage cannot well be cut out, since to cut out all affected bark would result in girdling the trunk or limb so affected and cause its death. Some good, however, may be obtained by treatment. If the wood underneath is not yet dead the disease may be checked, but not certainly cured the first year, by scraping off or rubbing off the loosened cracked bark and painting the areas with Bordeaux paste. (See article in California Cultivator for August 6 for formulae and details as to making Bordeaux paste). The experiments so far carried out with Bordeaux paste at this stage of the disease show that when the dead bark is carefully scraped off the disease has been materially checked, even where the bark was affected clear around the trunk or larger limbs. The smaller affected limbs should be cut out at all stages. The results appear to vary with the care used in treating the areas. As in the case of the other gum diseases, considerable gum, even more than before treatment, may ooze out for some weeks after treatment. This is what happened in our experiments, and is to be expected. This gum need not cause any alarm. It will finally stop, harden and be dissolved away by the fall rains. The beneficial results are to be looked for the following summer.

If the disease has gone to the third stage, or so far that the wood underneath is beginning to die, there is, as a rule, no practical remedy, except to look toward taking out the limb or the tree so affected after the fruit is picked. If limbs in the second or third stage of the disease are badly affected and the trunk healthy, the limbs may be cut out and the trunk treated. If the trunk is in the first or second stage of the disease, it may be practical to treat it; if in the third stage, where the wood inside is dead for some distance, it will probably be best to look toward taking it out. It is well to bear in mind that the scaly bark disease is active, as a rule, only in the late spring, summer and early fall, and that it seems to stop and be inactive in late fall and winter. No matter what you do (even if you do nothing) the disease appears to be cured in the dormant period of late fall and winter. Any remedy, therefore, that is used must stand the test of a year and a half before any definite claim may be made for it. I would suggest that growers beware of any cure or remedy for scaly bark that is supposed to cure it in a few months' time. This few months is just long enough to bring the disease to a standstill in the fall and winter. Any remedy must stand the test of a summer following the year in which the treatment is made. For example, if an unknown treatment is made in June, 1914, one cannot surely pronounce on the value of the treatment until, say, September or October of 1915.

Briefly stated, psorosis or scaly bark of orange trees, in its development, may be said to have three stages:

1. The beginning areas, where a patch of outer bark is cracking up and is being pushed off in scales by the growth of new bark underneath.
2. The enlargement and spread of this first stage, until the areas surround the trunk or limbs without yet killing any wood.
3. A further development of the second stage, until patches of bark are killed through and the wood cells begin to die. This stage may require from five to ten years' time from the appearance of the first stage.

The first stage may be cured by cutting out affected bark and treating with a fungicide, as described above. The second stage, if on the trunk or largest limbs, may be checked and possibly cured by scraping off dead bark and treating. As far as known to the writer, the saw and the fire are the only sure final remedies for the third stage. Since the disease is so slow in its progress and its spread, advancing only a few inches each year and may be five or ten years in a tree before doing evident damage, one or two thorough tree-to-tree inspections of an orange grove each year would be sufficient to detect most cases in the first stage, when they are easily cured.

The Use Of
Hercules Dynamite
On Farm, Orchard and Ranch

MANY people who are unfamiliar with dynamite have the idea that it is both difficult and dangerous to use.

Relatively speaking, this is not at all the case. Of necessity anything which has great inherent power is dangerous under certain circumstances. The fire in your kitchen stove, the gasoline in your car, the electricity or gas that lights your home—all are in a sense dangerous. You have to be careful with them.

You have to be careful with dynamite too. But this necessary care is a very small price to pay for the almost unlimited benefits derived from it when put to agricultural uses.

It will give you better, stronger trees, finer fruit, bigger crops. It will run ditches, fell trees, lift stumps and rocks, excavate cisterns, cellars, wells, etc. more quickly, more efficiently, and at less expense than the same work can be done by any other means. Yes, that care it requires, is care well invested.

We have published an interesting and instructive book, "Progressive Cultivation." It tells all about dynamite—how to handle it, how to store it, how to use it. You will find it both interesting and instructive reading. Write for a copy. No expense involved.

CUTTING FUSE
TAKING OUT CAP
PLACING CAP ON FUSE
CRIMPING
MAKING HOLE IN TOP OF CARTRIDGE
INSERTING FUSE AND CAP
FOLDING CARTRIDGE PAPER AROUND FUSE
TYING CARTRIDGE PAPER AROUND FUSE

How to Prime a Dynamite Cartridge

"Priming" is the inserting of the detonator, whether blasting cap or electric fuse, into the cartridge. When cap and fuse are used, it is first necessary to attach the cap to the fuse.

The fuse should be cut into lengths long enough to reach from the charge when loaded in the hole to at least three or four inches above the surface. One cap is then taken from the cap box by covering all of them, except one, with the box lid or with the hand and allowing the loose one to slip gently into the free hand. Do not try to pick caps out of the box with tweezers, nails, or any hard substances as they are likely to be accidentally exploded. Slip the cap carefully over the end of the fuse, taking care not to push the fuse very hard against the explosive charge loaded in the bottom of the cap and do not twist the cap on the fuse. When the fuse is pushed to the bottom of the cap, make a crimp not more than ¼ inch from the open end of the cap by using a Hercules cap crimper. A glance at the illustration shows you how this is done.

There are two accepted methods of priming dynamite—placing the detonator in the end or in the side of the cartridge. The former is the better way.

When priming in the end, the paper is folded back at one end of the cartridge and a hole made with a wooden punch about the size of a lead pencil or with the straight handle of the crimper into the exposed dynamite. The cap with fuse attached is inserted into this hole and the paper drawn together and tied tightly. The cartridge is then ready for use.

Dynamite Removes Rocks Cheaply and Quickly.

There is but one best way to do anything. The best way to remove rocks or boulders from a field that is to be cultivated is by the use of of Hercules Dynamite. As a matter of fact it is, in many instances, the only way.

There are three accepted methods for rock blasting. It may be done by means of a block hole, a snake hole, or by mud-capping. The first is illustrated here. It is a slower method than either of the other two and is only necessary in cases of very large rocks or boulders.

When it is used, the charge is exploded near the center of the rock, as the illustration shows. When Hercules Dynamite is properly used the rock always goes, no matter what its size.

The other two methods of rock blasting are described in "Progressive Cultivation." Write for your copy.

California Apple Shov

Watsonville Apple Show Given Larger Scope and Moved Bodily to San Francisco. Great Exhibit Witnessed by Immense Crowds.

Written for the California Cultivator by its San Francisco Representative

Apples to right of us,
Apples to left of us,
In figures and boxes,
Stood all around us.

Ours not to eat of them,
Ours not to taste of them,
Ours but to look at them,
Only to praise them.

In all the dignity of an exposition, combined with exhibits from an educational institution and the best in art and beauty, the California Apple Show brought to the people of San Francisco in wonderful splendor a display of the realities and profits of the apple industry. It was a display the like of which this city had never seen. Its people had read of the shows in distant places and had fondly hoped to go some time, but here was the thing itself, even greater than the description had portrayed.

We have looked on many an apple show, but never such a one as this. It was one to make us leave all thoughts of former exhibits behind and to revel in the contemplation of the magnificence of the productions which are evidence of tremendous energy and ingenuity. We know that Watsonville has spent months of thoughtful preparation for this exhibit and she deserves due praise for the clever conceptions and the artistic way in which they are worked out.

It would be hard to conceive a greater stroke of business wisdom than is displayed in bringing to the people of a great city the show that has made Watsonville famous wherever apples are eaten. Heretofore hundreds of people have gone to Watsonville to see the show, but in San Francisco thousands have seen it, and have taken away with them a wonderful picture. It is the contrast between hundreds and thousands. It gives the man in the office a chance to see a little of the possibilities of country life. It inspires enthusiasm among those who are seeking a ranch, and it gives to the housewife a chance to see in carloads and in figures the things that she sees at home only by the dozen.

And San Francisco appreciated the honor of the occasion. From the Ferry building to the tents, a distance of nearly two miles through the heart of the city, festoons of flags pointed the way to the novel show. In every window was the announcement that the show was on. San Francisco took occasion to welcome this exhibit and to give praise in unstinted measure, for she is lavish with her good cheer and best wishes.

We knew it would be good, for the California Apple Show is always good, but we did not look for the varied array of figures, the display of apples in carload lots nor the feature exhibits which were everywhere in evidence.

The old water wheel had its true presentation in apples. It reminded us of the wheel by the mill with its constant murmur of dropping water. It recalled the boyhood days at the old pond, where we forgot the chores of the day and disported ourselves ca[illegible] free and fearless. The Panama-Pacific seal, done in dried apples, was a w[illegible] of art upon which any apple sculpt[illegible] may look with pride. The auditorium, where former apple shows have been held, was done in glasses of apple jelly. The Dutch windmill, always quaint in reality, found its counterpart in apples. It was complete in every detail, and stood as if ready to respond to every gust of wind. A[illegible] there was the elephant and the [illegible] We have become so accustomed to these figures that to be without the menagerie would have been a fatal error.

Perhaps the most unique display was the millinery work. There were the season's styles done to the queen[illegible] taste in dried apples. Gracefully festooned were ribbons, surmounted with feathers and stick-ups galore. This was a truly ingenious display, and o worthy of preservation—if it were p sible. Uncle Samuel was there wi his postoffice, giving object lessons the art of sending apples by parc post. There were many other f tures, such as houses, fanciful desig and elaborate decorations. The ent display in the main tent was s rounded by great vases, in whi vari-colored flowers added an inten beauty to the scene.

Utility features were grouped themselves in an adjoining tent, a the interest shown by the visit there was no less than in the ma tent. Manufacturers vie with ea other in showing to best advanta and exhibitions of this kind offer opportunity of showing their produ in very effective manner.

The American Can Company show a complete assortment of cans— sizes, shapes and kinds. They a had a good display of several differe makes of orchard heaters. The R wood Manufacturers' Company, of S Francisco, showed a full size silo, gether with water pipe made of r wood and wound with wire. This hibit was particularly complete and liberal proportions. The Yuba C struction Company was on hand w one of its small caterpillar tracto and the crowds which viewed showed that there is a growing terest in tractor power on the fa The California Rex Spray Compa gave a very creditable showing of sprays, giving an idea of the util of its production. The Bean Sp Pump Company had a complete spr ing outfit, with gas engine. The play of the C. C. Morse Company w particularly complete. It contained assortment of plants and seeds a presented a delightful contrast to mechanical exhibits.

We must not forget the Teddy bea the dollies, and the candy and p corn men. They were there a-plen The playground for the children w well patronized. On the whole manufacturers' tent was a worthy p of the show. It has always been part of similar exhibits, but we th that the selection of exhibits and general arrangement was the best have seen. There was absolute fr dom from anything to which one co take exception. It was clean and structive in every way.

This show did much for Wats ville, and it did much for the state. carried an advertising value wh cannot be overestimated, for the p ple came, they saw and were c quered by the tremendous possibilit of the apple industry. Similar exhi tions will do well to bear in mind t it is more profitable to bring the sh to the people than to expect the peo to travel to the show.

WHAT IS YOUR VERDICT?

By J. E. Gilligan, President Sa Quentin Agricultural Club

A scarcity of farm laborers just the season when they are absolut indispensable to the farmer rec each succeeding year and often cau the farmer much anxiety.

This lack of dependable help is so pronounced in California, perha as in some of the Middle West states, but it nevertheless assun sufficient importance to merit so consideration. In Kansas, Nebras Iowa, Missouri and Oklahoma it is unusual thing for the farmers to dr to the nearest railroad station to m freight trains in the hope of induc some of the hoboes and tramps, w are touring the country in side-d Pullmans, to help them out. Not frequently the services of a consta are requisitioned to persuade th victims of the wanderlust to accep [illegible] the alternative of 90 days [illegible] gang.

[illegible] new source of supply is be provided which may or may not m the requirements, according to the itude the farmers take on the nature f this source.

The division of agricultural educa-ion at the University of California as established classes in all subjects f agriculture and animal husbandry in the state prisons at San Quentin and Folsom, and is giving the students in these institutions the benefit of their extension courses. An understanding between Dean Hunt of the Berkeley experiment station and the wardens of these institutions has resulted in the voluntary enrollment of approximately 10 per cent of the inmates as students of agricultural pursuits.

Not less than 1500 men are being annually discharged or paroled from these institutions, which means that 150 men, who have acquired a theoretical knowledge of some of the agricultural pursuits, are available each year for work on the farms. Most of these men will have had such practical experience as the limited acreage of the prison reserves will permit.

The university farm school at Davis is less than 30 miles from Folsom, while the walls of old San Quentin frown from the northern shore of the bay directly opposite Berkeley; thus each institution is conveniently located and admits of frequent visits from the professors of each place.

Though this movement is yet in its infancy, the results thus far obtained are so gratifying that other states are preparing to follow the lead of California. Progressive thinkers are establishing many new precedents in the methods of handling malefactors, and it is altogether probable that within a year every state in the Union will have stepped into line, giving the inmates of their institutions the benefits of extension courses of their agricultural colleges. Should the percentage of prisoners who avail themselves of this privilege in other states be in proportion to those of California's prisons, it would mean that approximately 5000 men would be added annually to the available help for the farmer in time of need.

It is true that a great number of undesirables are to be found among the inmates of the penal institutions of the different states, but these are not among the numbers who voluntarily take up the study of agriculture, under any conditions. The time is already at hand when a higher standard of intelligence is required to render, even a helper in the field, profitable and efficient, than has obtained in the past, and while the number of farm laborers who are profiting by the liberal policy of the state agricultural colleges for acquiring technical knowledge is materially increasing, it is yet and must continue for some time to be totally inadequate to meet the demands. A recommendation from the prison officials as to moral fitness and a testimonial from agricultural colleges as to efficiency should render a paroled or discharged prisoner a more desirable employe than the flotsam and jetsam of the unskilled laborers on whom the farmer is forced to depend in time of need.

A further development of this movement must depend on the attitude taken by those who can enable the students from these institutions to find a market for the knowledge and skill thus acquired. The average farmer is too much occupied with his own affairs to give heed to such economic questions as prison reform, and too phlegmatic by nature to admit of maudlin sentimentality prejudicing his judgment in passing on a question of this kind; it is therefore reasonable to suppose that it will merely present itself to him as a business proposition and his verdict will be consistent with his own personal interest.

For the man whose career of lawlessness has been temporarily checked by the law, it means an opportunity to start anew among scenes and associates that will insure clean living, clean thinking and a clean conscience.

In conjunction with the routine class work, the students have organized an agricultural club, the primary object of which is to get in touch with organizations in rural districts with a view to mutual exchange of ideas and establishment of a fellowship which will enable us to secure employment for club members as the occasion requires.

The concrete question with which we have to deal for the present, however, is, "Will the agriculturists of this state look with favor on the efforts of the inmates of these institutions to qualify themselves for efficient service in the fields?" We recognize the futility of further effort unless we can find a market for the knowledge thus acquired.

ZENO

The Most Efficient and
Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

The Care and Feeding of Crops

Soil Fertility

"Soil fertility governs the value of the acreage. It costs just as much to produce a small crop as it does to raise a large one, and the value of the land is very largely determined by the income, or rate of interest on the investment which it will produce.

"Run-down, exhausted land that will produce at best a quarter crop is worth far less than one-quarter of its original value. For agricultural purposes it is dear at any price when you consider the income which would be produced by the same amount of time, money and energy expended on properly cared for fertile soil.

"There is no excuse for allowing a soil to become unproductive. Science has long since found the cause and the remedy.

Maintaining and increasing the fertility simply means replacing some of the nitrogen, phosphoric acid and potash which have been manufactured into crops and sold off the land."

This is a quotation from our book, "The Care and Feeding of Crops," a handy compendium with most valuable information for every grower. If you haven't a copy you should send for one at once. The information contained in it is so valuable that it may be the means of changing failure or moderate success in growing or farming to pronounced success. It has done so for others.

BETTER LIGHT FROM KEROSENE
TEN Days FREE Send No MONEY
Beats Electric or Gasoline

You Can Prove Our Claims Without Sending a Cent

We don't ask you to pay us anything until you have used this wonderful new modern incandescent light in your home for 10 days, putting it to every possible test and then if you don't say that it is the greatest oil light that you have ever seen, or you are not thoroughly satisfied, you may send it back at our expense. You can't lose a penny. We want you to prove for yourself, as thousands upon thousands of others have, that the Aladdin has no equal; that it makes the ordinary oil lamp look like a candle; that it saves one-half on oil; that it beats electric, gasoline or acetylene; lights and is put out like old style oil lamp; burns common kerosene (coal oil) without odor, smoke or noise; is clean, won't explode, guaranteed.

We Will Give $1000.00 to any person who shows us an oil lamp equal to the new Aladdin (details of this reward offer given in our circular which will be sent you). Would we dare make such a strong challenge if there was any question about the superiority of the Aladdin over all other oil lamps?

Get One FREE We want one user in each locality to advertise the Aladdin. To that person we have a special introductory offer under which the one lamp is **given free.** Drop us a postal and we will give full particulars about this **unequaled offer on an unequaled light** and our **10 Day Free Trial.**

We Want Men With Rigs or Autos to Deliver the Aladdin on our easy plan. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before, writes: "I sold 51 lamps the first seven days." Another says: "I disposed of 34 lamps out of 31 calls." Thousands of others who are coining money endorse the Aladdin just as strongly.

No money required. We furnish capital to reliable men to get started. Ask for our distributor's plan, and learn how to make big money in unoccupied territory.

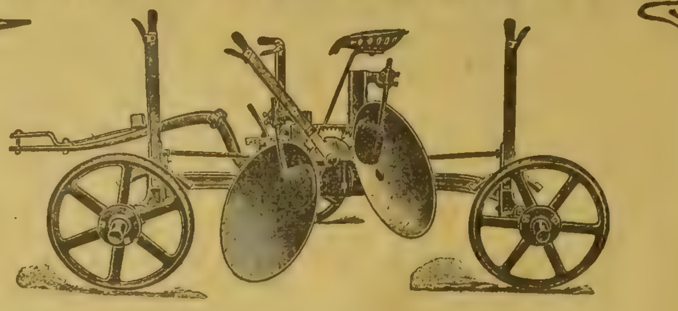
Mathews Reversible Twin Disc Plow



THIS is the only reversible disc plow which does not use segments to fix the position of the disc, and is therefore the only one which will always plow the same width of furrow both ways on level land and hillsides—**and stick to the work on hillsides.**

It leaves no water furrows. Discs are fixed in exactly the same working position every time the plow is lowered. Two discs wear twice as long as one—but cost you no more.

We are general agents for a complete line of Disc plows. Glad to tell you about them at any time.

Fair Play in Telephone Rates

IT is human nature to resent paying more than any one else and to demand cheap telephone service regardless of the cost of providing it.

But service at a uniform rate wouldn't be cheap.

It would simply mean that those making a few calls a day were paying for the service of the merchant or corporation handling hundreds of calls.

That wouldn't be fair, would it? No more so than that you should pay the same charge for a quart of milk as another pays for a gallon.

To be of the greatest usefulness, the telephone should reach every home, office and business place. To put it there, rates must be so graded that every person may have the kind of service he requires, at a rate he can easily afford.

Abroad, uniform rates have been tried by the government-owned systems and have so restricted the use of the telephone that it is of small value.

The great majority of Bell subscribers actually pay less than the average rate. There are a few who use the telephone in their business for their profit who pay according to their use, establishing an average rate higher than that paid by the majority of the subscribers.

To make a uniform rate would be increasing the price to the many for the benefit of the few.

All may have the service they require, at a price which is fair and reasonable for the use each makes of the telephone.

These are reasons why the United States has the cheapest and most efficient service and the largest number of telephones in the world.

PLANTING NOTES

Written for the California Cultivator
By Ernest Braunton.

Poison sumac, better known as poison oak, is of the same family as the pepper tree. When it grows in the open as a shrub of four or six feet it somewhat resembles scrub oak, but when it climbs trees it is called poison ivy. In northern Iowa, where a large part of my boyhood days were spent, we called it three-leaved ivy, knowing it was poisonous and presuming that all ivies were, though the plant is not related to the ivies, but a true sumac. (Rhus.)

Our California species is not always three-lobed in its foliage and has been appropriately named Rhus diversiloba. It is curious and interesting among poisonous plants, for while it is a most dangerous plant for many, others are seemingly immune from its effects, and I am happy to state I belong to the latter class. In Amador County I once encountered several acres closely covered with poison sumac about four feet high. Seeing no way around it and a good cattle path through, I hoisted my little boy up on my head and waded through and no subsequent ill effects were noticeable.

Strange it is that humans may handle oleanders, getting the juice over hands and arms and no harm results, while cattle, horses, mules and even the hardy burro are killed through eating the leaves. The same is true of the English yew and many other plants. On the other hand cattle and horses eat of the leaves of poison sumac with no bad effects, bees are unaffected, and honey made from the blossoms is as good as that from the average flower. Yet some people are so easily affected by it that a ramble along a hill path where none is encountered results in such severe cases of poisoning as to place one's life in danger. One such case I knew this summer, where the patient was under a doctor's care for six weeks. On the next ranch a man was grubbing out poison sumac for the whole six weeks, without other protection than a pair of gloves on his hands and not the slightest harm came to him.

Had I any of this plant on a ranch I should quickly get rid of every plant if only from a humanitarian standpoint. The digging out should be done during late autumn, just before the rains come or even immediately after the first rain, but before new growth has started. The plants are then past the blossoming stage and sap flow is slight and sluggish, the plant being as nearly dormant as it ever becomes and therefore comparatively safe to handle.

The poisonous properties lie in a non-volatile oil which is found in every part of the plant and present in the dead wood even after months of drying. While the oil is insoluble in water, a washing of exposed parts with hot water and strong laundry soap will remove the oil so that in many cases no harm will ensue. Sugar of lead and alcohol (applied externally, of course) will destroy the poison but if affected over a large area, this remedy may not be used without danger, as it is of itself very poisonous. A solution of permanganate of potash is used by many, and lime water or a solution of baking soda will destroy the poisonous properties for others. Even sliced onions rubbed well into the itching parts have been known to effect a cure.

The United States department of agriculture recommends the following solution, to be dabbed on the affected parts several times a day. Bottles containing this remedy should be properly labeled and kept from children as the solution is poisonous: Carbolic acid, two grams; resorcin, two grams; bismuth subgallate, four grams; equal parts water and lim water to make 250 c.c.

Plant Poppies Early

There is no cheaper, more effectiv or more appropriate way of beautifying private or public grounds, roadsides, parkways, railway embankments, vacant lots, etc., than in th free use of seeds of the native Califo nia poppy. The cost of seeds in bul (by the pound) is low;; every see will grow and make a large bush plant covered with beautiful flower Being the floral emblem of our stat and known the world over as "Cal fornia Poppy," it is most appropriat to plant, and our first time visitors, a well as the experienced winter tourist, will be delighted with a gran display of these flowers. Quite incidentally it may please and satisf ourselves, and I doubt not but thi should properly be the fundamenta consideration.

Ban on Trees

County Forester Grant of Sant Ana will plant no pepper trees i Orange County for the reason tha they prove such hospitable hosts fo black scale. The camphor tree, because of red scale, will receive th same passing notice. I do not in an wise blame him for this policy, muc as I love both these excellent trees There are so many other good tree for highway planting that it ma prove a pleasant change from inlan regions where pepper trees are ver common; in fact, the dominant tre

This policy recalls a good laugh a the expense of our Orange Count neighbors. Some years ago a meeting was held in the Los Angele Chamber of Commerce, Governor Pa dee and President Wheeler of the U of C., being present, to present site for a pathological laboratory and ci rus experiment station. An Orang County resident stated that the path logical station should be placed in hi county as it contained more insec pests and plant diseases than an other part of Southern California.

Now, it is well known that scal pests and fungi are most common i coastal regions and low altitude While in Orange County the fact tha the pepper tree is a host plant fo black scale is a fundamental conside ation, at Riverside and Redland where this scale will scarcely su

Fresno District Fair

Greatest Attendance Ever. Fine Showing of Live Stock and Babies.

Fresno surprised herself and the ntire San Joaquin Valley by the immense attendance at her Eighth Annual District Fair. Twenty thousand people passed through the gates on the ast day, and the attendance on the other days ran in the neighborhood of 2,000, or above. Saturday's attendance was said to be the largest gathering of people ever in the San Joaquin Valley. This means that the fair was a complete success financially, but more gratifying to the people of that section was the fact that it proved a successful effort to hold a for-sure agricultural fair to demonstrate the possibilities of the San Joaquin valley.

Of course, there were the usual side attractions, which aided in lending a holiday appearance to the fair. In addition to fat steers and big pumpkins, there were baby shows, milking contests, school contests, stock-judging contests, attractive booths of business houses and, to cap it all, an afternoon live stock parade passed in front of the grand stand. Regarding this parade the Republican said:

"The parade was held in this manner that the people might see the stock without having to stand in the dust and to insure a good attendance. Not in the history of the state has a stock parade been held in the afternoon on the race track that the people might see it with ease. Secretary Eberhart said yesterday that the plan had worked well, if compliments made to various fair officials meant anything.

"The parade was led by fine driving stock, blooded stallions and fancy racing, trotting and pacing stock. Jacks and heavy draft horses followed next. Following the long line of horses the cattle came up for inspection of the thousands that were comfortably seated in the grand stand with plenty of music to make the occasion more charming. Most of the cattle shown represented fine blooded dairy stock, and no better showing could be seen in any section of the state. The stock shown was complimented by thousands of ranchers and doubtless will serve as an incentive to many to 'get out of the scrub rut.'"

In the community exhibit Kingsburg took away the largest purse, which was $300. The display was a remarkably fine one, representing a model farm of 20 acres, with irrigation proceeding, and every feature of the work on such a ranch worked out in the model.

Among the other awards made are: Sanger, second premium, cash prize of $200; Selma, third premium, cash prize $150; Fowler, fourth place, with a cash prize reward of $100; and Caruthers, $50 prize.

A feature which attracted considerable attention was maintained by the post office department, giving instruction in handling of parcel post matter, also information as to more extended use of the post office facilities. This was most interesting because of the lessons directly taught, and more because of the fact that postal officials recognize the necessity of getting closer to the people, in other words, doing a bit of advertising. For instance, demonstrations were given showing the possibilities of shipping half a crate of eggs within ten miles for 15 cents, a plow point for 11 cents, or 50 pounds of groceries for 54 cents, or a three-dozen egg crate may be shipped anywhere within the second zone for two cents. This booth, which was a big one, was crowded at all times.

Judging in the horse classes, which was conducted in front of the grand stand, was done by F. M. Welchel. V. F. Dolcini, of the university farm, was judge of the cattle classes. Horticultural classes were judged by Horticultural Commissioner Cook, Deputy Weldon and Ernest Braunton. The latter was also judge of the ornamental plants.

The overcrowding of the live stock sheds was so apparent that two strings of sheds will be built before next year's fair. In fact, the management has determined before the next fair shall have come off, to build larger and better buildings to handle the immense throng.

Animal industry should be greatly encouraged by the display of live stock made at our fairs this year.

Fresno Fair Grounds

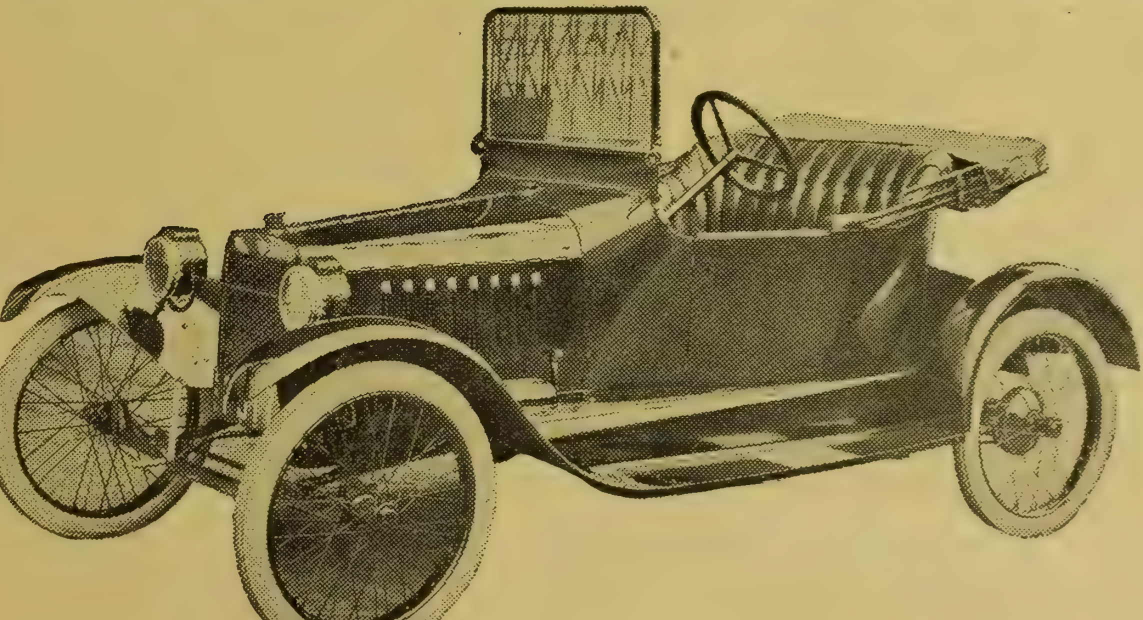
RIVERSIDE COUNTY FAIR

Last year's fair was an experiment, and so successful that a sound organization was formed and plans laid which will soon mature in the second annual fair, October 13-17.

The Riverside County Fair Association was incorporated early this year, 33 directors chosen and the following officers elected: President, J. F. Backstrand; vice-president, J. M. Davison; secretary, O. P. Sanders; treasurer, M. M. Milice; manager, J. E. McGregor. In the new fair grounds are 42 acres of land in a choice location near the electric line and steam road and just at the edge of a beautiful park lagoon. A spur track has been built from the railroad so exhibitors may unload their stock at the gate. Permanent improvements to the extent of $20,000 are being made on the grounds. The third annual poultry show is to be held in connection with the fair. About the entire grounds a high ornamental fence has been erected.

Entries are being received in great numbers and prospects are for large exhibits in all lines. Exhibitors are being especially attracted this year by the $10,000 to be awarded in premiums. Several of the prize-winning horses from the state fair at Sacramento are to be exhibited in the horse show. One feature of the swine division will be the wild hogs from the state school at Whittier. There is to be an apiary division and a large exhibit of agricultural products. A notable women's department is planned, with a "better baby" contest and a collection of cooking and sewing and juvenile work. There will be a fine arts division, educational exhibits and displays of minerals, machinery and vehicles.

1915 Saxon $460



IN HANDS OF NEW DEALER

WE DESIRE to inform the public we have taken the agency for the New Saxon Car because we are convinced it is the best two-passenger automobile in the world at anywhere near its price. It has better materials in it, is lighter, more up-to-date in design, has more style, has plenty of power for all emergencies and can be kept running for less cost per mile than any other car.

SAXON cars do not look like cheap cars. They have individuality, are roomy and comfortable; good cushions, an easy back and cantilever springs make riding pleasurable.

The motor is remarkably quiet and free from vibration. It will throttle down to four miles per hour on high and will get away with less effort and noise than other cars.

The wonderful economy of operation is the greatest source of satisfaction to the thousands of users. The car averages from 28 to 32 miles to the gallon of gasoline; 75 to 100 miles on a pint of oil and 5000 miles and more to a set of tires.

The Saxon is a car that seldom sees the repair shop, but when it does, the parts that may be required are low priced and the work is easily and quickly done, because of the simple and accessible construction of the car.

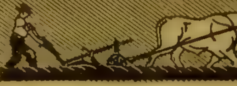
General Agriculture



"CLEANING UP"

Written for the California Cultivator
By Sacramento Valley Contributor.

Just how much "cleaning up" on a farm can the average busy farmer do at a profit?

This is a question that suggests itself time and again to any one who lives on a farm and gives any thought to his work.

On a large percentage of the farms in any community things are not kept well cleaned up and there is a condition of disorder rather than neatness and tidiness. Is this because it pays better to "let things go" than to be continually picking up and straightening up and arranging and putting away machinery and gathering boards and kindling wood, and the thousand and one other things the neat man on a farm sees to do? Or is it that some are naturally neat and others slovenly? Or would it pay better on all farms if everything was kept "spick and span" at all times?

We believe it is the experience of many of the best farmers, not only in America but all over the world, that it pays to keep a farm orderly, and that there is no better motto, not only from the standpoint of "peace of mind" but also from that of economy, than "a place for everything and everything in its place."

There are good fundamental reasons for this. Hours of time are lost looking for tools that have been left "lying around," and that should have been picked up and put in their proper place.

On one of the best managed and most profitable ranches in the Sacramento Valley, in the old grain farming days, if a man took a tool from the shop to fix a piece of machinery and did not bring it back to its place, it meant his discharge. The owner of this place prided himself on the neatness of his buildings and grounds. Every spring all sheds, barns and fences were whitewashed. After plowing time every plow was gone over, nuts tightened, wearing surfaces greased and other parts painted if they needed it, and the implement put away under a shed. Harrows were all cleaned up and painted, then stood up in a shed. And it is surprising how little space it requires to house harrows when they are set up on edge in this way.

There was literally a place for everything on this ranch. There was shed room at the sides of a big hay barn for all of the idle stock and young mules, and when this barn was filled with hay the rough feed for this stock for a year was in place for them, and only one more operation required, that of throwing it into the racks—no hauling of feed in muddy yards in midwinter because of lack of thought in planning the year's operations.

Neatness and order was made capital of on this place and the owner made money while many of his neighbors went broke.

There is no question but that it pays equally well to keep a small place neat. We all know of places where shovels and hoes and cultivators and hand tools of all kinds are around in the way and under foot all the year round, but on this kind of a place where apparently everything is floating around loose, the very thing you want is not to be found.

It generally takes some one "crank" around a farm to do the "picking up," and "keep after" everyone else on the place to make them be neat. This one person must be continually at it. First, on a badly disordered farm there must be a big general clean up, and places must be provided for all tools and the principal machinery. Then some one place must be made for a "junk heap," where a lot of miscellaneous things useful sometime perhaps, but not in regular use, may be put. All trash and everything that will make firewood should be stacked in some place handy to the stove, or picked up into old sacks and piled in some shed or alongside the house.

After this general clean up comes the struggle to keep things in shape and in place. This more or less self-sacrificing "crank" who has the neatness of the place at heart must be willing to "pick up" after everybody on the place, and gradually others will get the "be neat" habit unconsciously. In a short time it would be hard to re-establish a condition of slovenliness.

Let everyone who reads this give the subject some serious thought and see if by being the "crank" he cannot do himself and everyone on the ranch, and perhaps in the neighborhood, some good.

DOES AN AUTO PAY THE FARMER?

The question has been asked at least a hundred times by neighbors and friends if it "pays to keep an auto on the farm." I would say that this depends very much upon the auto, and a great deal upon the farmer. My own car I have driven four years, almost continuously, covering something like 60,000 miles in that time. This mileage was not all made "for fun." Much of it represents trips to town on business, with loads of stuff for market; trips, also, to distant points in quest of a particular breed of hog, fowl or calf. As a means of getting there, and getting there quick, no comparison can be made between motor car and the horse-drawn service.

With all its hard service, through mud and dust, rain and sunshine, my car has cost less than this same service would have cost if rendered by team; moreover, the time saved represents enough to buy a rig or two.

As a Market Vehicle.

The motor car makes it possible to derive returns for certain things that would not otherwise be possible. For instance, in early spring we have a quantity of rhubarb, celery and other vegetables of such quality as to demand an extra bonus provided we get them to town by 7:30. It is eight miles to town—a good two hours' trip by team with a load. By removing the tonneau seats and placing a platform on the rear deck, I can haul a load of 700 to 1000 pounds on my car, and get this load to town in 30 or 35 minutes. So the motor can get the stuff to market "while the dew is still on." A team can't do that. It brings back a load of supplies, empty cream cans or goods for the neighbors, for which they gladly pay a reasonable sum for transportation.

Then there is the pleasure, and what I please to call the "benefit" feature of a car for the farmer. Formerly it was just about impossible for us to attend church in town, or go to a lecture, a good show or other amusement. The trip by team consumed so much time that it made a very late Sunday dinner, or an all-night session on the road when coming home after an entertainment. Now it is easy—just a half an hour's spin going or coming, which means dinner on time, and everybody in bed at a decent hour. Sometimes I really wonder if it is eight miles to town; in former years I was dead sure it was ten.

I do practically all of my own repairing, and visit the garage only for oil and gasoline. By this means the upkeep expense is just about nothing. A motor car does not demand such constant attention as a horse. but there are some things absolutely required to keep in perfect running condition and reduce expense bills.

As to the make of a car—be sure that it is a good one, manufactured by a reliable concern, and by a company that gives promise of doing business for several years. You may need parts later on, and want to know that the company is still manufacturing them.—Successful Farming.

THE POTATO CONVENTION

(Continued from Page 339.)

a circulation that all plants may obtain pure water. Periods of drouth followed by irrigation make warty potatoes.

Seed Selection and Inspection

The Burbank is now the principal variety grown, although the United States department of agriculture is trying to find a more disease-resistant variety. Seed potatoes now come from Oregon and are grown in California one year to become acclimated before being used for the main crop. It is hoped that seed stocks may soon come from the higher California valleys, where potatoes grow more vigorously, and that this seed may be kept free from all disease. All potatoes are now pretty generally affected with rhizoctonia and fusarium. In some states, notably Wisconsin, a system of inspection has been inaugurated whereby growers who intend to sell seed pay a government or state inspector to go over their fields at blooming time and later to ascertain if varieties are true to type and free from disease. If so a certificate is given. This system will undoubtedly be used here. It is also important that small cull potatoes be picked up and fed or made into human or stock food rather than left on the field to harbor disease and make volunteer growth.

Storage of Seed

Seed must be stored in a cool place, where it will not sprout nor become diseased, if the plants grown from it are to be vigorous and healthy. In a hot country this requires thick-walled buildings that can be cooled out at night and kept closed during the day. This is not now being generally done and is recommended as a necessity.

Diseases

Rhizoctonia is a fungous disease that lives in seed potatoes and soil. It appears as specks on the tuber and rots off the underground stems. It is claimed by Mr. Shear to have caused a loss of $1,000,000 in the delta region this year. It is eradicated by a long rotation of crops and prevented by clean seed.

Wilt, fusarium and verticilium cause discoloration of stems and tubers and a wilting of the growing plants. Clean seed and rotation are recommended for their control.

Scab, introduced by diseased seed, may be treated by soaking seed tubers affected for two hours in a formaldehyde solution consisting of one pint to 30 gallons of water.

Tuber moth is a storage disease, controlled by fumigation.

The eelworm causes damage by burrowing into the tuber and is avoided by using clean seed.

SUGAR BEETS

(Continued from Page 339.)

still more apparent. The comparatively small expense of producing an acre of beans, barley, wheat or oats, appeals to the farmer for different reasons. He has less invested in an acre of grain or beans, and the effort to produce either is less than that required to produce an acre of sugar beets. If we stop at this point the farmer will not raise sugar beets. But if, like the ordinary business man, he is succeeding by a close study of modern methods and efficiency, he will study the problem from both sides. If by the application of a more intelligent rule of selection and the more thorough preparation of the soil, and by cultivating it, he finds he can produce a crop paying him from 25 to 40 per cent better than some other, he will take the added risk and assume the harder work.

In the above statement of the higher cost to produce an acre of sugar beets, every item of expense is figured in the amount. Of course many farmers would do their own team work and save considerable. If the same rule is followed in charging expenses against the production of the grain crop it will be seen that the margin for any grain crop above expense of production is well under $15 per acre for the average. It may be stated, plainly and empratically, that it does not pay to raise a poor crop of beets. The average yield, about 11 tons, is not good enough. No farmer raising sugar beets should be satisfied with less than 15 tons. At 15 tons his profit per acre will be more satisfactory than from any other general farm crop, including potatoes.

Then there is the indirect benefit which the farmer receives from the raising of a sugar beet crop on his land, which is of great importance. In many experiments made to test this, and in the experience of all sugar beet growers in every section of the country, the increased productivity of the soil on which the beet crop has been grown, especially for grains and potatoes, is remarkable. The following figures are reliable as showing the results in the beet growing sections of the rotation value of this crop:

In a section where wheat yielded 27 bushels to the acre before the beet crop rotation nearly 43 bushels were produced the next season, with very light disking of the soil. The crop of barley in this section increased from 39 bushels to 59 and oats from 41 to 61. These figures are average and not outside figures.

This country will always produce grains; they are the great staple crops. In many of the old grain producing sections of this state these lands have lost their great fertility because of a wrong system, or rather lack of system, of cropping. The coming of the sugar beet proves what may be done to increase the grain yield. At the same time the indirect benefit of sugar beet cultivation is shown to the farmer and is well worth his consideration.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

How To Save Money on Tires

Firestone Tire & Rubber Co., Akron, O.
Without obligation on my part please send me free a Firestone Inner Tube Bag and your book, "The Care of Tires" I want Book No. 36. Below I give name of tire I use and dealer I buy from.
I use the following make of tire ______
Dealer's name ______
Dealer's address ______
My name ______
Address ______

THE Firestone experts have answered that question once and for all for every car owner. They have answered it first by building the kind of tires that save most money. And they have answered it also with a valuable book that shows how to save some money, no matter what tires you use.

If you own a car, send the coupon above or write us for this book. If you give us the name and address of your dealer and mention what tires you use, we will also send you Free a Firestone Tube Bag. See below.

Firestone
Tires and Tubes
Defeat Them All in Service—Meet the Ordinary in Price

For 15 years—as you may know—Firestone quality has led the world. There has been no break in the matchless record of Firestone Tires in daily service, on all roads, on all kinds of cars. Yet they cost you no more than the average. Firestone builders are tire specialists, with the largest exclusive tire factory in America. You get the benefit of this specialized production and enormous output. Only average price for the tire of extraordinary service. Most Miles per Dollar.

FREE to Car Owners
Tell us the name and address of your dealer and the tires you now use, and we will send you Free with our book this popular Firestone Waterproof Tube Bag Will keep your extra inner tubes fresh, dry and clean, and protect them from injury.

If You Can't Get Firestones Easily
We Will Have Them Sent to You
Nearly every dealer sells Firestone Tires, but if your dealer has none, he will get them promptly if you insist. If you are not near a dealer, write us, and we will see that you are supplied from a nearby station.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SILO CAMPAIGN.

Texas has been engaged in a general campaign of education regarding the advantages of silos. The interest has become so great that a census recently taken showed the establishment in that state of 8560 silos, costing over four and a half million dollars. The campaign is being pushed along by the Texas Business Men's Association. They have made thorough investigations and have unbounded faith in this method of furnishing cheap succulent feed.

THE VERDICT

There is an unfortunate condition in the labor situation in that there are always supplies of incompetent help, and too often they do not have the desire to become competent. There are also cases where labor must be done and the supply of help seems insufficient. To make inefficient workers more efficient is certainly a movement worthy of support. An interesting statement is given on another page of the Cultivator from Mr. Gilligan, president of the Agricultural Club of San Quentin. The question in the last paragraph of Mr. Gilligan's article is up to the growers to answer. Let us give the helping hand.

DRY FARMING CONGRESS

The International Dry Farming Congress, Soil Products Exposition and International Congress of Farm Women is to be held at Wichita, Kansas, this week and next. It will close on Saturday, October 17. Reports from there show that there has been gathered a wonderful display of working models, and demonstrations are made of the various methods of manufacture of farm implements and of the effectiveness of up-to-date machinery. The stockyards at this place are giving a special feeder stock demonstration with cattle. It is estimated that before the close of the exhibits 200,000 people will have inspected them.

FEDERAL AID FOR BEETS

The department of agriculture has decided to establish permanent headquarters in Los Angeles, from which extensive investigations will be made as to sugar beet culture. It has been represented to the department that with 90,000 acres of sugar beets in the southern part of the state there is great need of all the help the department can give in controlling pests and in determining best conditions of culture.

The industry has been somewhat discouraged by the removal of the tariff. Notwithstanding the jump in prices made possible by the war the manufacturer is the only one receiving the benefit, and the grower is still marketing his beets under the 75-cent reduction which was made by the factories this season.

DON'T BE TOO SURE

The attorney general of this state has given an opinion regarding the eight-hour law in effect that it probably contravenes the 14th amendment to the federal constitution and would be put out of commission by the United States supreme court. However, the surest and safest way and best way of expressing opinion in this matter is at the polls, so no matter how unconstitutional the bill may be, let us vote against it, and let the vote be so overwhelming that it will discourage a similar measure ever being forced before the voters at a future election. Let every reader of the Cultivator use the mails to reach everybody within his acquaintance to make sure that as many votes as possible are worked up against the meassuse. State some of the disastrous things which will occur if the bill passes and is declared constitutional.

PANAMA-PACIFIC

President Moore writes regarding the Panama-Pacific Exposition that any impression that the exposition will be deferred a year or even a day, should be corrected, for the exposition will open on Saturday, February 20, 1915. "As to attendance, all expert opinion agrees that there is nothing in the situation, even if continued through 1915, that will affect seriously the willingness or ability of the people of the western hemisphere and of the far east to visit the exposition. Some opinion is firm that travel to California may even be increased by the war. The decision of the exposition management has, however, been reached without regard to that consideration. We consider it our duty alike to our nation, to the participating nations, to our exhibitors and to ourselves to carry out the plans as originally laid down and which, now nearly at fruition, promise the most important, the most beautiful and the most successful exposition in history."

PRODUCE MORE

American newspapers have been busy for the past two or three months discussing the effect of the war upon this country. At the very first it was hard to subdue a feeling of elation that there would be a large increase in business in this country because of the European disaster. Later when the pinch came as the result of the war it was evident that America and all the world was suffering with Europe. Cotton growers, sugar beet producers in need of seed and dozens of other bodies of farmers felt the pinch; grain was perhaps benefited. But as the country devises its own way of doing things—for it is becoming apparent the European war is not to be short-lived—we believe there will be at least a partial recovery from the present depression. Every effort is being made to improve transportation conditions. Capital is also being interested in factories which shall work up our own cotton and other products so far as possible. The greatest problem is, however, the one of transportation, and it is so great a problem the country over that it will encourage extension of American shipping until it can in a degree handle the products of our farms. The world must be fed, and so large a portion of it is engaged in war that the remainder which does produce will find ample market.

So the producer must fit himself with implements and appliances to work his farm to the limit. Plans are being made now for next year's crop. We believe it is wise to plan large. Make every acre produce to the utmost, even if it requires purchase of new and improved machinery. An eastern exchange in discussing this matter of feeding the world and the fact that each farm is not producing up to its fullest possibilities, makes this statement:

"As the pressure for supplies becomes greater, it becomes more evident that the world cannot afford large farms skimmed over with careless culture. In an actual experiment, of a gain of 200 per cent which was made in the productiveness of a certain area, 100 per cent was found to be due to better plowing and harrowing, 50 per cent to better cultivation, and the rest to better seed."

If this is true of farming in general it is certainly true of the opportunities which are before American producers.

"The handwriting on the wall is plainly visible and we should prepare ourselves to meet the crisis before the crisis meets us. It means much and yet all that we can do is to do all that we can with the exercise of care and thrift. Our work begins this fall in our plowing and seeding, and our opportunity to help will come next year at our harvesting and selling. We have more at stake than our profits, although our profits will be a goodly stake. We have at stake our commercial supremacy, our agricultural leadership, and above this, towering over everything and stifling our selfish hope of gain or our commercial instincts, is our ability and our willingness to fill the pitiful hands which we know will be stretched out to us from the devastated, wasted fields across the seas."

A word of warning however may be in order, and this because of a circular just received from the department of agriculture, which calls attention to the danger in special crops or those which inexperienced growers are very liable to fail in, that is, crops which are used for the production of drugs, perfumes, and other products for which we have depended on Europe. There is something attractive in growing a crop which few others produce and which has little competition in the market, but the growth of these plants calls for special talent, and if a contract is not made for a crop before it is planted it is very probable there may be no market for it. Staple food products always find a ready market, and while not always at long prices there is minimum risk in growing them.

Agricultural News Notes

The National Nut Growers' Association meets in Thomasville, Georgia, October 28-30.

In the province of Ontario, Canada, there are 30 cooperative associations marketing fruits of members.

Cuban sugar interests are very optimistic over prices for their produce. The sugar mills are putting in all the men they can secure at work preparing the plants for early grinding.

The "telescribe" is an instrument recently perfected, capable of reproducing on the wax cylinder of the ordinary dictating machine both sides of an ordinary telephone conversation.

To keep out the potato wart disease the United States has prohibited introduction of potatoes from Newfoundland, St. Pierre, Miquelon, England, Scotland, Ireland, Germany and Australia.

American apples sold in Sweden are known as California, Oregon and American apples. The best qualities sold are Winesaps, Spitzenbergs and Jonathans. Red apples are preferred; green apples, with the exception of Newtowns, cannot be sold there.

Congressman Bryan of the state of Washington has introduced in the House a bill for the construction by the government of a railroad from Marysvale, Utah, southward into the national forest in Arizona. Marysvale is the southern terminus of a branch of the Denver and Rio Grande.

The practice of inoculating pigs with cholera serum is now extensive in Hungary. In the five years preceding April, 1914, government reports show that more than a million animals have been operated on. Pigs intended for fattening are generally treated with the serum shortly after being put into the fattening sties, and losses are thus avoided.

The United Fruit Growers of the Pacific Northwest, whose products in the future will be handled exclusively by one large central organization known as the North Pacific Fruit Distributors, did a large business last year. The united organizations shipped 3958 cars of fruit and 1125 cars of potatoes. They derived from their sale a total of $3,069,935. Apples brought an average of $1.25 a box.

The Georgia peach crop for 1914 was not so large as had been expected; estimates place the number of cars between 3200 and 3500. The prices received for the crop seem to have been satisfactory in the main. As a whole the fruit has been of high quality and free from disease and worms. The pack also has been above the average. The growers are learning by experience that the best fruit pays the most money, and spraying, as well as general orchard management, is improving from year to year.

Leaving out of consideration the mountain pastures, whose area is difficult to estimate, the area of the land available for agriculture in Albania is between 500,000 and 600,000 acres. The greatest land owner is the state, and the large estates of which it disposes are partly absolute state property and partly "mewkuf" and "vacuf"—i. e., ecclesiastical property. The large private estates are in the hands of about five great families, each of which possesses from 100,000 to 150,000 acres of land. Medium-sized estates of about 500 to 1000 acres in extent are fairly common all over the country, while peasants' farms of about 25 acres are rare in the plains, but prevalent in the mountains.

Agricultural News Notes of the Pacific Coast

Northern California

The close of Shasta County's prune harvest shows a very small crop.

Alturas, Modoc County, held a two-days' farmers' institute September 29 and 30.

A new cheese factory is to be established at Patterson, in Stanislaus County.

The rice crop of Yuba County will this year net the growers over $200,000.

Vacaville, Solano County, has started a movement to secure a county farm adviser.

Mendocino County owners of timber lands have organized a forest protective association.

The university farm at Davis has opened its fall term with almost double last year's entries.

In the milking contest at the state fair Miss Blany, owned by A. W. Morris, carried off the honors.

There was a meeting of deciduous fruit growers at Sacramento October 7 to discuss standardization.

Over 2,000,000 trees will contribute to the exhibits of the California Apple Show, to be held in San Francisco October 1-11.

A Willows Holstein breeder has sold 20 pure bred cows, heifers and calves to a Southern California buyer for $400 each.

Walnuts received at the Fullerton-Placentia packing house are running 97 to 98 per cent No. 1's. The crop is estimated at about 75 per cent of normal.

The schools of Vine Hill, Contra Costa County, were closed for two weeks to allow the children to assist in grape picking, as the yield of grapes is unusually large this year.

The Turlock cannery has just completed a banner pack of 100,000 cases, exceeding last year's records by 35,000 cases. Seventy-five per cent of the pack consists of peaches, 20 per cent apricots and 5 per cent pears.

Records of the Orange County Vegetable Growers' Association for the year show total receipts of over $6200. The membership of the association is among growers at Villa Park, where they have their own packing house.

The different units of the Yolo County farm bureau have determined to hold a general meeting at Woodland, October 30. It is proposed to have a competitive exhibit from different parts of the county at that time.

Ripe dates the latter part of July are reported from the United States agricultural experiment station at Indio, Riverside County. As this is at least three months before the fruit from the Persian Gulf can reach our markets, the industry here seems to have a bright future before it.

Sixteen thousand young wood oil trees were recently shipped from the United States plant introduction garden at Chico, Butte County, to points in Florida and Georgia. The tree, an importation from China, bears a nut which yields an oil highly valued in varnish production.

Central California

Kings County fair is on at Hanford this week.

A grower near Visalia has a record of producing 30 tons of sugar beets to the acre.

The Poplar grange will entertain granges of Tulare County the evening of December 20.

There will be a butter scoring contest during the dairy show at Modesto October 15 to 17.

Fresno's district fair was held the week ending last Saturday. It was pronounced a great success.

A recent meeting of the Fairmead unit of the Madera County farm bureau was attended by 75 growers.

Prominent irrigationists of the state are hoping to bring to Modesto the 1915 congress of the International Irrigation Congress.

Alpaugh, Tulare County, closed its first annual agricultural fair the last week in September, after a very successful exhibit.

The Madera Unit of the county farm bureau is discussing the practicability of organizing a cooperative poultry association.

Rice grown on alkali land at Delano, Kern County, shows up in remarkably fine shape, and will encourage more extensive planting another year.

Plans to establish a branch of the state agricultural college on the Kearney ranch, in Fresno County, were discussed by Dean Hunt at Fresno recently.

Several grape packing houses of the Fresno district closed down the last of September, waiting for the eastern demand to catch up with the California supply.

Manager Madison, of the Associated Raisin Company, announces August shipments of raisins totaling 8,900 cars, as compared with 5,000 cars for August, 1913.

The Turlock section of Stanislaus County is in the middle of its bean harvest. There are some 3,000 acres to be harvested. Indications are for an unusually heavy tonnage.

Modesto has organized a unit of the county farm bureau as the first step toward securing a county farm adviser. Other sections will follow with the formation of local centers.

The Visalia Cooperative Creamery was awarded the gold medal for the highest score at the state fair at Sacramento. Thirty-four California creameries competed for this honor.

Much enthusiasm was evinced at the meeting of the committee appointed by the Fresno District Fair Association to arouse interest in securing a farm adviser for Fresno County.

The Associated Raisin Company reports extensive shipments of raisins during the past month to dried fruit dealers of England, Denmark, New Zealand, Australia and the Orient.

Olive growers of the Lindsay district of Tulare County have determined to join the Tulare County Growers' Association, adding 125 acres of olive orchard, to be handled cooperatively.

Southern California

Hemet will ship 75 cars of oranges this season.

The opening day of Ventura's County fair showed 3,000 visitors.

Saticoy has organized a center of the Ventura County farm bureau and elected H. C. Sharp, director.

Ventura County walnut growers are very well pleased with the quality of the nuts now being harvested.

Chili drying houses of Garden Grove, Orange County, have begun work. A good crop is expected.

The Goleta packing house has finished cracking nuts of last year's crop and is ready for the new nuts.

The Antelope valley of Los Angeles County reports a bumper crop of almonds. It is estimated at 125 tons.

Dates are now being picked at the Heber experiment farm. A total crop of about 36,000 pounds is expected.

Ventura County's bean acreage this year is about 50,000, and the crop is estimated as well into a million sacks.

October 16 will be San Jacinto day at the Riverside County fair, which will be held from the 13th to the 17th, at Riverside.

The Ventura County farm bureau has appointed committees on seed selection and expects to form a hog raising association.

The Fallbrook unit of the San Diego County farm bureau held a picnic last Friday. County Farm Adviser J. A. Armstrong was present.

Orange County's walnut crop is valued at $900,000 this year. That county claims to produce about half the walnut crop of the state.

The Santa Paula farmers' club held a meeting the evening of October 6, which was addressed by Dr. Webber, of the citrus experiment station.

Nuts being received at the packing house of the Santa Ana Valley Walnut Growers' Association are testing 97 per cent first class sound meats.

The lemon pruning demonstration recently held at Sespe under the auspices of the Ventura County farm bureau was attended by 90 growers.

Citrus growers of Olive, Orange County, are planning to build a new packing house. A building committee has already been appointed by growers.

Los Angeles has been added to the list of cities which will receive the "Farm-to-the-Table" service of parcel post. The postmaster will receive names and addresses of growers, with articles they have for sale, and these will be distributed throughout the city in bulletin form.

At the annual meeting of the Bloomington Fruit Association directors for the ensuing year were elected, as follows: A. D. Litts, Lou F. Chapin, W. P. Martin, F. A. Wood, C. H. Ehrhorn, C. E. Wheeler, G. Leiser, D. C. Swartz, George W. Kelley and Mrs. P. H. Watson. The officers elected are: W. P. Martin, president; D. C. Swartz, vice-president; F. G. Webber, secretary and manager. The association shipped 32 cars of lemons and 265 cars of oranges.

The Coast

The cotton gin at Chandler, Ariz., is running full blast.

The Oregon state fair was held at Salem September 28 to October 3.

A train of 24 carloads of sheep left Grangeville, Idaho, for Chicago, recently.

Arizona has sent a large exhibit to the dry farming congress, to be held in Wichita, Kansas, this month.

The Pecos valley, in New Mexico, will hold an agricultural fair at Roswell the week beginnig October 24.

Over 6,000 head of Arizona cattle have been shipped by one firm to Bakersfield, California, for fattening.

Sugar beet factories of Utah began slicing beets about the 20th of September and are now in the middle of their heaviest run.

The North Pacific Fruit Distributers are protesting against what they call unwarranted slashing of apple prices by independent sellers.

On account of scarcity of Oregon potatoes dealers have been compelled to bring in supplies from the Yakima district in Washington and from California.

Cattlemen of Cochise, Santa Cruz and Pima counties, in Arizona, have organized an association for the purpose of betterment and protection of cattle ranges.

Shipments of apples from North Yakima were estimated at 6,000 cars early in the season, but indications now are that the estimate was almost 2,000 cars too low.

Colorado growers of Rocky Fords are casting up accounts for the marketing season. They find they have shipped 11,000 carloads of cantaloupes and received fair returns.

The Northern Arizona fair will be held at Prescott October 15 to 17. This is the annual exposition of the five counties of Yavapai, Mojave, Coconino, Navajo and Apache.

There was an unusually large number of livestock exhibited at the Washington state fair this fall. Sixty-five hundred dollars was distributed in cash premiums to exhibitors.

There has been heavy buying of wheat in shipping centers of the Northwest, presumably by foreign interests. It is estimated that over half the crop is already disposed of.

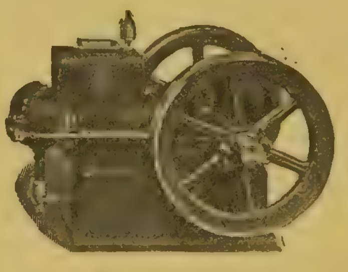
Farmers of Paradise, Oregon, are saving the best of their straw to use, if necessary, as roughage to lengthen out the short hay crop. Owing to the prolonged dry spell ranges are said to be fast drying up.

A mass meeting of farmers of the "North Side" of the Salt River Valley, Arizona, was held last week for the purpose of effecting an organization of farmers, with the primary object of employing a farm adviser.

The sale of 1,000,000,000 feet of standing timber from the Kaibab national forest in Northern Arizona, with authority for construction by the purchasers of 200 miles of railway, has been approved by Secretary Houston, of the department of agriculture.

Doubly Insure Against Drought

By installing a pumping plant equipped with an **ALPHA GASOLINE AND DISTILLATE ENGINE** and an **IDEAL GREEN FEED SILO.**



ALPHA Engines

will simplify your pumping problems.

A big hot spark.

A quick start results — No batteries—No Coils—No troubles.

The IDEAL Green Feed Silo

is a perfect and permanent insurance for the live stock owner against drought. There is no investment so certain of future returns as a well filled **IDEAL GREEN FEED SILO.**

DAIRY ASSOCIATION—CREAMERY OPERATORS

The Second Annual Convention of the California State Dairy Association, in conjunction with that of the California Creamery Operators' Association, will be held in Modesto, October 15-17. There will be addresses by Professors G. H. True, Leon M. Davis and H. E. Van Norman of the State University, and Messrs. Graham, of the Panama-Pacific Exposition, J. P. Murphy, Robert Holcomb, A. Jensen, S. H. Green, Hon. J. W. Guiberson, F. W. Andreasen, of the State Dairy Bureau, G. W. Pierce, A. W. Morris, S. A. W. Carver, and others.

In the butter contest which will be held in connection with the convention the following rules will be observed:

Exhibitors are permitted to make only one entry and not more than one entry will be permitted to be made from any one creamery.

Entries must not be less than 18 pounds of butter.

It is suggested that for convenience, contestants send a small cube of butter, being nine inches square and the height of the regular two-pound square, this being equivalent to nine two-pound squares, with the advantage of keeping better on account of being in a solid block.

Entries of butter, while recommended to be in a small cube, may be in a 20-pound tub or any package at the exhibitor's option, provided it bears no distinguishing marks that cannot be readily removed by the committee.

Entries should, wherever possible, be shipped by Wells, Fargo & Co's. Express, and in time to arrive at Modesto not later than the evening of Oct. 14th, in order that they may be scored by the judges.

To insure the neat appearance of your package on arrival, cover it with stout paper or burlap.

All entries become the property of the Association, and after crediting the exhibitor with his annual dues, the proceeds of the sale of the same will be devoted to the prize fund, etc.

All those entering in butter contest will be entitled to compete for a special scoring prize. The one coming closest to the judges' score to win $10.

The secretary of the Association is A. P. Ferguson, Modesto.

ALAMEDA COUNTY FAIR

Written for California Cultivator

By J. H. Lettow

Truly a county fair could have no better setting than the one at Pleasanton, nestling, as it does, beside a beautiful mountain and in the midst of a fertile valley.

The stock exhibit no doubt would have been larger had the premiums offered greater inducements, but even at that the cattle department was well represented both by local breeders and several from outside the county. Those who came from a distance deserve praise for the fine condition in which their stock was kept. Hogs and especially sheep were well represented. Stalls and pens were very convenient to the main entrance. The horses were sent to the far end of the grounds, but once found, the visitor couldn't help admiring what this section produces.

F. M. Whelchel of Santa Susana, Ventura County, was the judge selected for awarding the prizes among all stock, and he did his work carefully and well.

Exhibits in fruit, vegetables and grains showed superior quality over those of previous years. Mention must be made of the splendid educational exhibit in all departments made by the state college of agriculture.

Premium for best general exhibit from any organization, $50, was won by the Danville Grange, which also won silver cup for the best decorated booth. Washington township took the $25 premium.

It is to be hoped that with 1500 head of cows now being milked within six or seven miles of Pleasanton this fair will have a greater line of stock and dairy exhibits next year.

MILK CANS SHOULD BE JACKETED

The dairy division of the department of agriculture has just completed a series of tests on the change in temperature of milk in cans during transportation from the farm to the consumer. These tests established the importance of jacketing cans of milk with some appropriate insulating material.

It has been found that milk that has to be sent only short distances or preserved for only a few hours should maintain a temperature of less than 50 degrees. Even at these temperatures some bacteria will multiply and cause the souring of the milk, but the increase is slow, and during a few hours no serious results will occur. A temperature well below 50 degrees Fahrenheit, however, materially decreases the rate of bacterial growth.

On the other hand, where milk is to be shipped long distances, the initial temperature must be lower, assuming that no provision is made for maintaining the original temperature during transportation. Where milk is in transit for several hours it is necessary to cool it down to near the freezing point. So soon as the milk can is exposed to air temperature, and especially to the sun, the temperature of the milk begins to rise very rapidly, and every precaution should be taken to keep it from being raised by the outside heat.

A series of experiments was recently made in shipping milk cooled to 50 degrees. In these cases the cans were set in an open truck with no covering to shield them from the direct rays of the sun. The milk was hauled a distance of 13 miles and the average air temperature during the trip was 82.65 degrees. The experiment showed that the cans that were hair-quilt jacketed showed a rise of only five and one-half degrees in three hours in the temperature of the milk. The cans that were wrapped with wet burlap showed a milk temperature of 58½ degrees in the same period, or a rise of eight and one-half degrees. The milk in the unjacketed cans rose in three hours to 78 1-2 degrees, or a rise of 28 1-2.

It is obvious from these figures that it pays to jacket the cans in order to maintain a low temperature during transportation.

CARE OF SOW AT FARROWING TIME

Brood sows should be allowed plenty of room to exercise in, up to about two days of farrowing time. They should be kept in yards and pens where they will not be obliged to pass through narrow gates, over boards, doorways or through low doorways where they are obliged to bend their backs to get through. Any one of these is likely to result in dead pigs at birth.

It is a good idea to feed whole oats scattered on the feeding floor or ground for a week or two prior to farrowing, so that the sow will be forced to exercise in getting her feed. When about due to farrow, the sow should be put into a pen which has been fitted with wall guards, where the pigs may find safety after birth. The ordinary pig guard is useless because it is neither high enough from the floor nor far enough from the wall, and the space underneath fills up with straw so that the pig is crushed almost as easily as if the guard were not there.

For thin, active sows a large pen may be used. For extremely heavy, fat sows it is best to have a pen space comparatively small, so that the sow cannot turn around quickly and thus step on her pigs. The sow should not be fed heavily just prior to farrowing, nor just after farrowing, but should have a thin slop for a few days, so that there may be no tendency to con-

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint. Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

stipation. If there is any such tendency, a dose of epsom salts should be given in the swill.

The bedding in the pen should be kept absolutely dry, as dampness, particularly in cold weather, will very quickly cause death loss among young pigs. Within a week or two the sow and her litter should be moved out to a colony hog house, where they will get more exercise. When the pigs are two or three weeks old two or three sows may be turned together.—G. E. Morton, Colorado Agricultural College.

HOW TO AVOID SILO-FILLING ACCIDENTS

By observing three simple rules, the farmer who is using silo filling machinery for the first time may avoid some of the accidents which occasionally damage new machines beyond repair.

Here are the things that, according to W. E. Markey, university agricultural experiment station, the inexperienced man should do:

1. Be sure that the machine is being run at the proper speed.
2. Take care that corn is never put into the machine until the motion is up to full speed.
3. In stopping be careful not to shut off the power until the elevator is empty.

If the elevator is not empty the cut material will fall back and lodge in the fans. Then when the machine is started again, the cut corn jams the fans and as a result they are bent or broken.

DODDER IN ALFALFA

Dodder is a parasitic seed plant. The stems are slender, thread-like, yellowish or reddish and twine about the plant upon which they live. The life-history of dodder is peculiar. The seeds germinate in the ground. The young dodder plants soon attach themselves to other plants. Then the stems connecting the dodder to the soil soon break away, leaving it entirely attached to the host plant from which it must secure all of its nourishment. Avoid the introduction of dodder seed with alfalfa seed. Pains should be taken to remove affected spots in the field. In the large majority of instances this procedure will be sufficient. If the stand of alfalfa is very badly affected, plow up the crop before the dodder goes to seed and put the land in a cultivated crop for two or more years.—W. W. Robbins, Colorado Agricultural College.

HOG SHIPPERS SHOULD DEMAND CLEAN CARS

"While there are sanitary regulations requiring that all stock cars in which cholera hogs have been shipped be disinfected, it is up to the shipper to be on the safe side and see to it that all the cars he uses are clean."

So states Dr. B. A. Beach of the College of Agriculture, University of Wisconsin, relative to the matter of filthy stock cars, which are becoming a serious factor in the spread of hog cholera. Dr. Beach states that cholera germs remain alive for weeks in cars which have contained diseased animals. Cases are also on record where cholera has been brought into a community simply by the passing through of germ laden cars.

DAIRY NOTES

A dairying industry will automatically bring about hog raising and poultry growing, because the skimmed milk that is not used in raising calves can be marketed most profitably in the form of pork or poultry. Every dairyman can raise two hogs a year for each cow he keeps, and sour milk is one of the best poultry feeds in the world.—Texas Industral Congress.

The best time to feed silage is directly after milking or several hours before milking time. It has been found that when silage is fed immediately before milking the odors of silage impart undesirable odor to the milk. Calves soon learn to relish silage Yearling calves will consume about half as much silage as cows.

The whole measure of success in the average dairy business today depends upon an intelligent answer to that searching and vital question, "Is

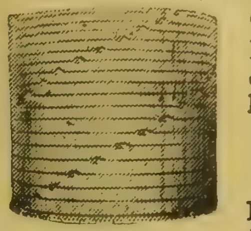
SILOS

All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.

TANKS

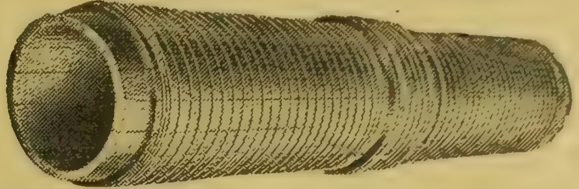
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Fine for Dairy Farms

We sell a great many Pilot Lighting Plants to dairy farmers. Because dairy farmers can get even more out of an Acetylene installation than anybody else.

Our Dairy farmer patrons make these Acetylene plants do double work. They run an extra line of pipe to each barn—and sometimes to other outbuildings. In these buildings they fasten the great balls of Acetlyene light to timbers or rafters.

They also equip these lights with ignition devices—to make them light with the pull of a chain without matches.

Two of these Acetylene barn lights will make a big dairy barn as light as day. They will give more light than a dozen lanterns—and unlike lanterns, they cannot be tipped over.

The same is true of Acetylene house lights. They burn in handsome stationary bronze or brass fixtures securely fastened to ceilings or walls.

Acetylene is too, a double boon to the women folks. In addition to the beauty of the light, it brings even a greater convenience in the gas cooking stove.

For Acetylene is used in gas cooking ranges in thousands of country homes, just as city gas is used in millions of city homes.

In all of these homes the gas range has shortened cooking hours and has done away with the drudgery of handling coal, wood and ashes.

Pilot Acetylene Generators are the most widely sold light and fuel plants in the world.

Our advertising literature tells why they are safe, reliable and trouble proof. Write to

every cow in the herd making a profit for you?" This question can be answered only by testing systematically the production of every cow, and weeding out the poor ones.

Where both feed and live stock are raised upon the farm you have two chances for making a profit—one upon the feed and another on the animals, and in case you break even on both, the manure is still left to maintain the fertility of the soil.

All milk utensils should be made from smooth-surfaced material, without seams, and all vessels should be discarded if the coating is worn off, as it is impossible to keep them clean. All utensils should first be rinsed with cold water, and then thoroughly washed with hot water containing soap or some washing powder.

Care of Horse

Will you give a subscriber some useful hints as to the care and upkeep of a horse? I am on a ten-acre orange grove, planted two months ago, and have just bought a fairly good horse; although not a very fat one. Any advice as to feed, etc., will be appreciated.—Subscriber, Plano.

A large part of the knowledge necessary for the proper care of a horse must be gained by practical experience, but here are some general rules that should help some: Give one-sixth of the day's rations in the morning, two-sixths at noon and the remaining three-sixths in the evening. Give plenty of water half an hour before each feed and plenty between feeds, but none just before nor right after feeding. A horse should have one pound of hay for each 100 pounds of the horse's weight each day of 24 hours. The weight of the grain fed should nearly or quite equal that of the hay when the horse is working, but may be reduced one-half when he is idle. Every day that a horse is idle he should have very little or no feed at noon, but do not add that amount to the other feeds. Horses should have a tablespoon of salt once a day and a change of feed occasionally. A horse should not be put to work immediately after eating, but should be allowed half an hour or more to partly digest his food. There are good reasons for the above rules, but space will not permit of their discussion here. It should be sufficient to say that they have been thoroughly tried and found to work well. Grooming improves the coat and adds much to the health and appearance of a horse.

Lung Worms

About 10 per cent of my dairy calves have been taking sick with lung fever and nearly all of them die. They take sick after they are from two weeks to two or three months old. They cough and their ears hang down. When they lie down they hold the head and neck stretched out. For some time they drink milk as usual, but get weaker and generally die. Very seldom one gets well. Please let me know what can be done to check it.—Subscriber, Bakersfield.

The trouble is probably caused by lung worms. The history of the lung worm is not well known, but it is supposed to be in damp places in the pasture and to be taken in with the food. Usually we hear of it affecting young cattle in the summer and fall. The best remedy known is turpentine. Drench the calf with one ounce of turpentine in a cup of milk. For full-grown animals double the dose. Repeat this treatment every two or three days until cured. A better and quicker way to reach the worms is to use a hypodermic syringe and inject one-fourth the dose of turpentine clear, directly into the windpipe. The needle of the syringe should be passed through the skin and between the rings of the windpipe, and after injecting the medicine hold the animal's head up for a moment until the medicine runs down into the lungs. Two or three treatments of this kind will usually cure.

Foul Breath

I have a male cocker spaniel about 11 years old that has a very foul breath. Can your veterinary department suggest any remedy?—Subscriber, Palo Alto.

Probably the odor comes from decayed teeth. Take him to a veterinarian and he will extract them. If no decayed teeth are found, then give him two grains of calomel and repeat the dose once a week for a month or two.

Proud Flesh

I have two colts that were cut on wire two weeks ago, and I have been treating them with sheep dip and water, but proud flesh is starting to grow in the cuts. Can you tell me what to use to kill the proud flesh?—Subscriber, Crows Landing.

Burnt alum or air-slaked lime will usually stop proud flesh, but sometimes it needs more heroic treatment. After trying the above, if the proud flesh does not disappear, then get some nitric acid and apply a little with a swab. This will form a scab, and when the scab comes off you may need to touch it again with the acid. Be careful when handling the acid and do not get it on your hands or clothing. It is a strong caustic. There are some cases where the superfluous growth of flesh is so persistent that it becomes necessary to use the red-hot iron.

Wire Cut

Three weeks ago a colt of mine was cut by a barb-wire fence on front leg just above the hoof. The wound seemed to be all right for a time, but the leg began to swell and four ulcers have formed between the wound and the knee. The knee is slightly swollen, but does not seem sore. The wound is filling out all right, except that it has probably filled out too fast. I cannot decide whether there is proud flesh in the wound or not. It is very sore to the touch. Have used burnt alum, but it did not seem to have any effect. For a few days I have poulticed it where the ulcers are. What is best to do with it?—Subscriber, Solvang.

The swelling was caused by a little blood poison getting into the wound. The ulcers indicate that the poison has stopped and the swelling will probably not extend much farther. Your poultice is all right, but when making the next poultice use coarse bran and hot vinegar. Put it on quite warm. For the proud flesh get an ounce of nitric acid and apply it to the sore with a swab. When the scab comes off apply it again. Be careful when handling the acid and do not get it on your hands or clothing. It is a strong caustic. The wire may have cut off a nerve and dragged it out so it was exposed and a tumor has formed on the end. That would be a small white ball with a very small attachment. The wound will never heal while such a tumor is there. It must be drawn out and cut off close to the flesh so that the flesh will cover the end in healing. It will hurt when the nerve is cut.

Now is the Time

Poultry for Profit

CARE OF MOULTING HENS AND DISPOSITION OF SURPLUS STOCK IN SUMMER

Written for the California Cultivator
By E. E. Cauble.

There has existed a wide range of opinion in regard to the best way of feeding and handling hens during the moult. All of the so-called quick methods have been forgotten or discarded, and those who practiced and advocated the starvation of the industrious hen to cause her to drop her feathers should be covering their faces in shame for if ever nice biddy deserved good feed and care it is during her change of dress, for at that time the entire being of a fowl is seemingly overhauled and put in working order. And the success of this general overhauling depends on whether they are supplied with plenty of good food and water or otherwise.

It is possible to take a bunch of scrubby-looking hens, and with care and good feed, bring them out of the moult a fine-looking bunch—in condition to be profitable in egg production for another year, but it must be done by right feeding and not by starving or even skimpy feeding. The hen is a machine, as it were, like a dairy cow, and your profits must be measured by the amount of balanced food she consumes. Any other method can hardly be profitable. However, there are other phases of the industry, and the range flock of the rancher does not come under this class. It may be plainly seen that the small range flock that has access to the barn, stables, stacks, etc., as a rule goes through the moult better than limited range flocks do. In order to correct this then we must provide the hen in close quarters with a variety of feed and plenty of it. She must have an added per cent of animal food; she must have more fat producing food such as cornmeal, cottonseed meal and sunflower seed and a good place to scratch for the needed exercise, which is important during the moult, as hens are liable to be inactive unless made to scratch for their grain.

Plan of Feeding

In the first place it is best to provide dry mash hoppers or covered troughs where dry mash may be kept constantly before them. This mash may be prepared egg food—which is best—or equal parts middlings, bran and cornmeal. Add five per cent each, bone, beef scraps, fish meal and charcoal (granulated). For early morning mash take chopped alfalfa (green or hay) or alfalfa meal and mix with rolled barley, scald and let stand a few minutes. To this add equal parts bran and corn meal, with a little fish meal or meat scraps. Mix all till crumbly and feed what will be cleaned up in five minutes.

Hens will hardly eat enough dry mash alone to supply their needs at this period, hence the wet mash which they eat readily. Most any kinds of grain will do so long as there are at least two kinds, as wheat and barley, corn and barley or Egyptian corn and wheat. I have used quite a lot of whole barley this year because it is cheaper, and prepare it in this manner with good results: Put the whole barley in a deep box or barrel with drain holes at bottom. Wet down thoroughly; in 10 or 12 hours wet again. This is ready to feed in about 24 hours. The hull is softened so that it is all easily digested. It should be used before it sours. However, a small amount of malted barley is very beneficial to the fowls and much relished. Mix wheat or corn with the soaked barley and feed in deep straw for the evening feed and give plenty to scratch for next forenoon. Always keep plenty of fresh water for moulting hens. I have found it a fine plan to provide shallow water troughs for the hens to get into with their feet. They enjoy it very much, and with a spoonful or so of kerosene in these troughs occasionally scaly legs can be cured or prevented.

Marketing Surplus Hens.

Most people wait too long to market their old laying stock; they start to moult, get ragged, lose weight, and the price is not satisfactory. If your hens are purebreds advertise them in some good farm paper about the middle of April. There is always somebody wanting good breeding stock at this date or later and willing to pay above market price.

At any rate sell old stock early in the summer when in good condition though they may be laying fairly well. This saves feed bills and insures good market prices, while eggs are at the minimum price of the year.

Tacoma, Wash., Dec. 29-Jan. 2, 1915, J. A. Caddey, secretary.

Certain of the Chinese in the interior districts adjacent to Amoy employ an ingenious method for hatching both hens' and ducks' eggs. The breeder first takes a quantity of unhusked rice and roasts it, cooling it down by fanning or allowing the wind to blow through until it is lukewarm. He then spreads a three-inch layer of the rice in a wooden tub and places about 100 eggs thereon; another layer of rice, this second and subsequent layers being but two inches in thickness, is spread over the eggs. Each tub will have six layers of rice and five layers of eggs, so that there will be 500 eggs in each tub. The rice is heated once every 24 hours, the eggs being taken out at such times. When the eggs are again put in the rice the bottom layer is placed on top, and each of the other layers one row lower down, while the eggs previously in the center of the tub are placed at the edge. The entire tub is covered with a cotton mattress. One of the great difficulties with this method is the inability to tell just when the eggs will hatch, which, of course, renders the smothering of the young ones very possible.

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cotton Seed Meal for Hogs

We have daily, say 2000 pounds whey from our cheese factory which is fed to our hogs. They have also the run of an alfalfa pasture. We can buy cottonseed meal at $20 per ton. How much of this meal could we safely mix with each 100 pounds of whey and what results may we expect by feeding this meal?

Great care must be exercised in feeding cottonseed meal to hogs. Many will not feed it at all because of the danger of poisoning. Would refer inquirer to article in the Cultivator of July 9, 1914, page 38, in which this matter was discussed and methods given for successfully feeding the cottonseed meal. However, proceed with the greatest caution.

Nematodes and Wireworms

One question which almost every orchardist or gardener must face is that of wireworms and nematodes. We have asked Mr. J. E. Graf, connected with truck crop and stored product insect investigations of the bureau of entomology of the U. S. department of agriculture, to give us something as to treatment of these pests. He gives the following information:

"Concerning the damage done to beans by nematodes and wireworms, I will say that there is no specific remedy known for either of these pests, and as you state nothing concerning the size of fields affected, amount of infestation and damage due to each pest you mention, it is difficult to give the approximate remedies. However, I can state that if most of the damage is due to nematodes and the field is generally affected by these, the safest thing would be to rotate, planting preferably some non-susceptible crop. I presume the nematode is Heterodera radicicola, and the list of the non-susceptible plants may be found in Bulletin 217, bureau of plant industry, U. S. department of agriculture. In case the infestation occurs only in spots, and the field is large, beans may yet be grown with profit, and the question whether or not to continue planting beans or to rotate with other crops is a matter which could be best judged by the grower. In the case of wire worms, the injury varies so from year to year that most of the growers prefer to keep planting beans and take a chance on getting a fair crop. Where this is done the beans are planted extra thick, and while the wire worms may thin them out considerably, there is still a chance of growing a crop which will pay. The wire worms may be partially controlled by clean cultivation and the destruction of weeds in field between crops."

Leaf Spot of Alfalfa

A subscriber at Long Beach brings in stems of alfalfa badly affected with fungus. When less than half grown the fungus attacks the leaves of alfalfa so seriously that growth is stopped and leaves soon drop so that the entire crop is lost. Seed was also submitted. All of which was sent to Prof. H. S. Fawcett of the pathological laboratory at Whittier, and he writes:

"The specimen of alfalfa which you sent in a day or two ago is affected with a rust and leaf spot fungus. It is probable that the unusually moist, cool weather of this year has encouraged the spread of this fungus. I am wondering what variety this is, whether or not it is the Arabian. I should think that the disease might largely disappear as the weather becomes dryer."

However, the grower of the alfalfa informs us that this is the Chilean or common variety.

Canker

What appears to be a small ulcer on the pupil of a chicken's eye grows larger rapidly until the pupil is covered. Appears to be painful. One chicken had it on both eyes and others only on one. Is it contagious and what is the treatment? These are young chickens, four months old. Two were sick six weeks ago and the third has just developed the trouble. They were separated as soon as the trouble was discovered. — Subscriber, Lemon Cove.

This looks like a sort of canker that is sometimes caused by mold germs getting into the eyes from the food or scratching litter, and it might possibly come from a bit of weed or some foreign substance that is irritating the eye. I should look for mold and also examne the eye to see if anything is in it. To treat the affected eye, try a sulphate of zinc solution (one grain of sulphate of zinc to two tablespoons of water). Drop one drop in the eye once a day for three days. I hardly think this can be anything contagious, but it is always wise to isolate sick brds.—J. A. K.

Crown Gall

I have a peach tree about five years old, the roots of which, just below the surface, are almost entirely surrounded by thick, pithy galls resembling rotten wood, which crumbles away in little chunks when struck with the hoe. Can you tell me what the trouble is and how to overcome it?—Subscriber, Los Angeles.

This is the common crown gall, bacteria tumefaciens, which is a serious proposition with the peach and many other trees. It forms a great mass around the crown of the tree, or sometimes attaches to smaller roots. If the knot is chiseled away with a sharp tool, leaving only healthy wood, which is then painted with Bordeaux paste or a copper solution, and the tree is watched to give treatment for later attacks, it is possible it may be saved. It is very hard to control, however, and with very young trees the safest method is to remove entirely. Care should be taken that no nursery tree is planted which shows this disease.

Preventive of Chicken Pox

Is there anything to give chickens as a preventive for chicken pox that may be fed in the drinking water?—Subscriber, Raisin.

Dr. N. W. Sanborn, than whom there is no better authority on poultry diseases, prescribes calcium sulphide both as a preventive and as a cure for chicken pox. Use one grain per day for each grown fowl in your flock. Do not give in water, but mix well into a wet mash and feed once a day. Calcium sulphide is a drug which often loses its strength when it is kept for a time. See that you get a heavy, strong-smelling drug if possible. If it seems weak you will have to use two or three grains instead of one. Continue the dose once a day till your sick birds begin to improve and those that have been exposed have passed the time for developing the disease.—J. A. K.

Aphis

I planted broad beans, which are now in bloom, but the plants seem to be dying, the leaves being covered with black insects which look like tiny flies. I send leaf with the insects. Am told the vines need spraying. What material should be used?—Subscriber, Chula Vista.

So far as can be determined from the leaves, this is simply a bad infes-

tation of aphis, of which there are many kinds. This is probably the common bean aphis—aphis rumicis. They are all easily destroyed by the simpler sprays, such as kerosene emulsion, tobacco extract, soapsuds, or even water under high pressure. But though today's generation may be nearly all destroyed, tomorrow's will appear to be even greater, so it is a matter of perseverance. A pound of tobacco stems steeped in a gallon of water and diluted to four gallons is sufficiently strong to destroy them, or perhaps a simpler remedy is to use a good tobacco extract, which may be purchased of any seedsman, and used at the rate of about one pound to 100 gallons. For further particulars would refer the inquirer to the Cultivator of September 11, 1913.

Woodlake

If "Woodlake," who sends query from Woodlake, will repeat inquiry and send full name, it will be referred to the legal department for answer. We will not use the name in the paper, but it is a rule that unsigned communications will not receive attention. We presume in this case the attorney will simply answer to the inquiry presented, "No."

Stock for Apricots

Is it all right to bud on apricot roots?—Subscriber, Anaheim.

We assume that the subscriber refers to apricot buds. Many prefer the apricot root, others prefer peach, while some consider the plum root best, especially the Myrobalan. The reason for the different preferences is that different soil conditions demand different stocks. If for very cold soil, then the Myrobalan stock is best; for the lighter, loamy soil the peach, or often the apricot, is preferable.

Pendulous Crop

We have a flock of young turkeys hatched in April. Since midsummer four or five of them have had enlarged crops, which have seemed to grow larger steadily. We operated on one, cutting a hole into the crop and draining it of more than a pint of water. We afterward sewed up the incision, but it seems that the crop filled quicker than before. Turkeys afflicted seem to be free from pain, but are handicapped in walking and running. They have had no feed save green alfalfa and curd, and oat stubble field to run in.—Subscriber, Allensworth.

Enlarged or pendulous crop in young turkeys is usually explained as the result of irregular feeding or of overdistention of the crop by overfeeding in some particular instance, but it seems to me the trouble with your turkeys may be the lack of hard grain. All fowls need a good deal of hard grain, and I doubt if yours have found enough in the oat stubble field. Failing to get enough grain, they would naturally stuff their crops with green alfalfa, and would perhaps overdistend them in this way. I always feel my turkeys' crops when they come for their supper, and govern the amount of wheat I give them accordingly. I want the crop to feel hard and well filled when they go to roost. Some breeders recommend a dose of baking powder for cleansing and sweetening the crop in such cases. Give about half a teaspoon in water enough to make it easy to swallow, then try bandaging the crop quite firmly with soft cloth wrapped several times about the neck. I have never had occasion to try this, but it is said to be the easiest way to manage these cases. Give a good feed of wheat at night to give the muscles of the crop a chance to exercise, and plenty of grit and charcoal.—J. A. K.

Grapes Not Ripening

I have grape vine, Rose of Peru variety, on which the grapes did not ripen. Have given plenty of water and fertilizer but there are now ripe, half ripe and green grapes all on the same stem. What is the cause?—Subscriber, Earlimart.

Mr. J. W. Mills suggests that evidently the trouble with these grapes is they have been given too much water.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D No. 3, Riverside, Cal.

RABBITS

New Zealand Reds—Scored and sold on merit. Investigate. Our catalog is free. Caldwell Bros., Los Angeles, Cal. Box 613.

LABOR SAVERS

Notwithstanding milking machines and other appliances are greatly reducing labor, or making labor more effective in dairying, there is still opportunity for the use of many other labor saving appliances in the dairies of California and fortunately the need is being met by inventive genius and with improved stanchions, feed carriers, litter carriers and other appliances, and large dairies employ less men than formerly. This is fortunate and leads to greater profit to the dairyman. One of the most helpful catalogs we have seen along this line is furnished by the Louden Machinery Company, Fairfield, Iowa, and while expensively and beautifully gotten up we doubt not it will be sent to any dairyman for the asking.

GOLD MEDAL

The Tribble Nursery Company at Elk Grove, Sacramento County, has pardonable pride in the fact that it took home the gold medal and $25 in cash for best display of cultivated nuts at the recent state fair. It was truly a fine showing of 162 varieties of nuts, many of which were grown on the lands of the Tribble Nursery Company. The Cultivator endeavored to secure a photo of the exhibit, for it was well worth reproduction, but owing to poor lighting conditions the photo was not clear enough for engraving purposes.

In addition to the medal and first premium on display the same company won first on best three varieties of walnuts; first and special mention (Gold Medal) on pecans; second on best filberts and second on best chestnuts.

IF you have a daughter of the "high school" age, we believe that she will receive definite advantages by studying this fall at Cumnock Academy.

The reasons for our belief can be given in a personal interview; our representative will be glad to call on you in your home, or will talk with you at the school.

The Cumnock Academy offers four years of work preparatory for college; and four years of liberal education for those who do not wish to go to college. It also offers courses in the seventh and eighth grades which prepare students for Academy or High School. A faculty of ability and experience aids the students in realizing the ideals of the school scholarship and that general culture which is the outward manifestation of refined and educated womanhood. Every student in the Cumnock Academy has the advantage of courses given by the faculty of the *Cumnock School of Expression.*

The Fall Term is just commencing; send for terms and particulars. Send, too, for our portfolio of views; mailed on request. Address Dept. B.

A MOTHER'S PRAYER

I hear the blaring bands go by; I hear the marching feet;
All day they drum their dreadful dirge along the dusty street.
I hear the crowds give cheer on cheer of fierce delirious joy,
And wonder if they see him there, my little baby boy.
A baby only yesterday, with soft and sunny hair,
So helpless and so innocent; so fragile and so fair!
So strong I felt to shield him then, safe sheltered in my arm;
It seemed to me the whole wide world could never do him harm.
And oh, the long, long nights I watched beside his trundle bed
To fight away the pain that racked his little fevered head.
I fought his battles for him then; he leaves my side today
To fight far greater ones alone, and oh! so far away!
The little dimpled hand that lay so trustingly in mine
Must grasp a rifle barrel soon along the firing line.
My baby boy I held so close I felt his fluttering breath
Has left me empty-armed and gone to see the face of death.
And never mother's voice to soothe nor mother's arm to shield
From all the direful perils of the smoke-hung battlefield!
Oh, why must mothers stay behind? Is not a mother's place
Beside the baby that must look in Death's remorseless face?
The years have wrought a change in him that only others see—
For all his soldier uniform he's still a boy to me,
Sent forth to kill, he knows not why, a king's insensate toy,
While I must wait and pray at home—my baby, baby boy!

—James Montague.

WHEN THE GERMANS ENTERED BRUSSELS

By Richard Harding Davis in New York Tribune

The entrance of the German army into Brussells has lost the human quality. It was lost as soon as the three soldiers who led the army bicycled into the Boulevard du Regent and asked the way to the Gare du Nord. When they passed the human note passed with them.

What came after them, and 24 hours later is still coming, is not men marching, but a force of nature like a tidal wave, an avalanche, or a river flooding its banks. At this minute it is rolling through Brussels as the swollen waters of the Conemaugh Valley swept through Johnstown.

At the sight of the first few regiments of the enemy we were thrilled with interest. After, for three hours, they had passed in one unbroken steel-gray column, we were bored. But when hour after hour passed and there was no halt, no breathing time, no open spaces in the ranks, the thing became uncanny, unhuman. You returned to watch it, fascinated. It held the mystery and menace of fog rolling toward you across the sea.

The gray of the uniforms worn by both officers and men helped this air of mystery. Only the sharpest eye could detect, among the thousands that passed, the slightest difference. All moved under a cloak of invisibility. Only after the most numerous and severe tests at all distances, with all materials and combinations of colors that give forth no color, could this gray have been discovered. That it was selected to clothe and disguise the German when he fights is typical of the German staff in striving for efficiency to leave nothing to chance, to neglect no detail.

After you have seen this service uniform under conditions entirely opposite, you are convinced that for the German soldier it is his strongest weapon. Even the most expert marksman cannot hit a target he cannot see. It is a gray-green, not the blue-gray of our Confederates. It is the gray of the hour just before daybreak, the gray of unpolished steel, of mist among green trees.

I saw it first in the Grand Place in front of the Hotel de Ville. It was impossible to tell if in that noble square there was a regiment or a brigade. You saw only a fog that melted into the stones, blended with the ancient house fronts, that shifted and drifted, but left you nothing at which you could point.

Later, as the army passed below my window, under the trees of the Botanical Park, it merged and was lost against the green leaves. It is no exaggeration to say that at a hundred yards you can see the horses on which the Uhlans ride, but cannot see the men who ride them.

If I appear to overemphasize this disguising uniform it is because, of all the details of the German outfit, it appealed to me as one of the most remarkable. The other day, when I was with the rear guard of the French dragoons and curassiers, and they threw out pickets, we could distinguish them against the yellow wheat or green copse at half a mile, while these men passing in the street, when they have reached the next crossing, become merged into the gray of the paving-stones and the earth swallows them. In comparison, the yellow khaki of our own American army is about as invisible as the flag of Spain.

Yesterday Major-General von Jarotzky, the German military governor of Brussels, assured Burgomaster Max that the German army would not occupy the city, but would pass through it. It is still passing. I have followed, in campaigns, six armies, but, excepting not even our own, the Japanese or the British, I have not seen one so thoroughly equipped. I am not speaking of the fighting qualities of any army, only of the equipment and organization. The German army moved into this city as smoothly and as compactly as an Empire State express. There were no halts, no open places, no stragglers.

This army has been on active service three weeks, and so far there is not apparently a chin-strap or a horseshoe missing. It came in with the smoke pouring from cookstoves on wheels, and in an hour had set up post-office wagons, from which mounted messengers galloped along the line of column distributing letters, and at which soldiers posted picture post-cards.

The infantry came in in files of five, 200 men to each company; the lancers in columns of four, with not a pennant missing. The quick-firing guns and field-pieces were one hour at a time in passing, each gun with its caisson and ammunition wagon taking 20 seconds in which to pass.

The men of the infantry sang "Fatherland, My Fatherland." Between each line of song they took three steps. At times 2000 men were singing together in absolute rhythm and beat. When the melody gave way, the silence was broken only by the stamp of iron-shod boots, and then again the song rose. When the singing ceased the bands played marches. They were followed by the rumble of siege guns, the creaking of wheels, and of chains clanking against the cobblestones, and the sharp, bell-like voices of the bugles.

For seven hours the army passed in such solid column that not once might a taxicab or trolley car pass through the city. Like a river of steel it flowed, gray and ghostlike. Then, as dusk came and as thousands of horses' hoofs and thousands of iron boots continued to tramp forward, they struck tiny sparks from the stones, but the horses and the men who beat out the sparks were invisible.

At midnight pack-wagons and siege guns were still passing. At 7 this morning I was awakened by the tramp of men and bands playing jauntily. Whether they marched all night or not I do not know; but now for 26 hours the gray army has rumbled by with the mystery of fog and the pertinacity of a steam-roller.

RUSSIAN FEDERATION OF FARM WOMEN'S ASSOCIATIONS

Of late years farm women's associa-ions have arisen in increasing num-ers, first in the provinces of East russia and then in Schleswig-Hol-tein. Their aim more especially is to nstruct their members in domestic conomy, to engage in the sale of do-nestic rural products and to provide, by means of the establishment of shops in cities, good and fresh food supplies for families in urban centers; in fact, to equalize the advantages of city and country.

The women's associations in the four provinces of East Prussia, West Prussia, Pomerania and Schleswig-Holstein have already formed themselves into provincial federations, and in other provinces they will soon take similar steps.

At an assembly held in Berlin February 17th, 1914, on the initiative of the "Prussian Royal College of Rural Economy," at which there were present representatives of the four provincial federated societies, and of those farm women's societies of provinces in which there are not yet federations, and also delegates from the chambers of agriculture concerned, it was decided to establish a "Prussian Federation of Farm Women's Associations."

The federation proposes to form a central institution for the work of the provincial federations among the agricultural housewives' associations, and to act as their representatives, especially in regard to:

Courses for the completion of the education of housewives in domestic matters.

Course of domestic economy for girls.

Increase in profits from domestic economy and facilitation of sales of produce.

Supply of fresh food to families in the cities.

Encouragement of fruit growing and horticulture, bee and poultry keeping, on scientific principles, as well as other branches of domestic economy.

Struggle against the exodus from the country to cities, maintenance of family life among agricultural laborers by the creation of profitable household industries; the provision of lucrative, independent, agreeable work for women indoors, or in the cultivation of vegetables and flowers, and provision that women agricultural laborers may have opportunites of sharing in the advantages of the farm women's associations.

THE POTATO AS FOOD

Written for the California Cultivator
By Sacramento Valley Contributor

"Potatoes are given to young children as one of the first solids they can take because the starch of the potato is one of the most easily digested foods we have," said Professor Jaffa, of the University of California, at the banquet given to the West Coast Potato Growers' Association by the Stockton Chamber of Commerce, at Hotel Stockton, September 26, 1914. He was discussing the potato as a food for man and beast, and brought out many valuable facts that were new to the potato growers and experts present.

Because the starcn of the potato is so soluble and digestible, potato flour is used by leading chefs for making soups and gravies, and in many other places where wheat flour is ordinarily used.

Not only is the starch of the potato a most valuable food, but the tuber contains a comparatively high percentage of vegetable salts which are of great use in the building and replenishing of bone and tissue. Prominent among the elements contained in these salts are potassium and phosphorus. In comparison with the grains the dry matter of the potato contains many times as much of these vegetable salts as there is in wheat or barley.

Dr. J. H. Kellogg, of the Battle Creek Sanitarium, in Michigan, a leading authority on foods and their relation to health, includes a large quantity of potatoes in the ration of all patients taking treatment.

In order to retain all of the food value of the potato care should be used in peeling it, some of the richest part of the tuber being in that part next the skin. A thick peeling removes a per cent of nutritive value greater than the comparative amount in weight because of the more fibrous and watery texture of the center of the potato. Boiling or baking potatoes with their "jackets" on is a good way to retain all of the food value and delicious flavor.

4%
and Absolute Safety
for your Savings!

The SECURITY TRUST & SAVINGS BANK of Los Angeles is the oldest and largest savings bank in Southern California, with deposits totalling over Forty Million Dollars. More than 88,000 individuals claim it as their banking home, and of this number many transact all their banking business by mail. You can bank by mail with this big bank with every assurance of the same safety and satisfaction these 88,000 depositors now enjoy. Deposits can be mailed in the form of checks, drafts, money orders or currency in registered mail. Four per cent interest is paid on Term Savings Accounts. Write for full information regarding banking by mail.

MAJESTIC
Cooking is so important!

More and
hotter water!

Majestic water heating front is fitted with eight hollow pins that extend right into the fire; giving greatest water-heating surface of any range made; heats more water much quicker and hotter than ordinary water front.

Good cooking helps the health and happiness of your family.

Surely you should have a range that will enable you to do your *best* cooking.

"Majestic" makes good cooking easy. It is not just "so much metal put together to hold fire"; each part is scientifically built to do its work **just right.** Made of malleable and charcoal iron, metals that resist rust and wear three times as long as ordinary range metals.

All joints cold-riveted (no putty used)—a Majestic stays tight—holds the heat in, maintaining uniform baking heat with least fuel.

The Majestic provides perfect baking qualities, plus fuel-saving and work-lessening features that you cannot get in ordinary ranges. The little extra it costs is more than repaid by the years longer wear that it gives.

The health and happiness of your whole family is effected by the range you buy. Investigate **thoroughly.** There is a Majestic dealer in every county of 40 states; if you don't know the one near you, ask us, and get "Range Comparison" explaining Majestic ranges fully.

A person, well, sick or convalescent, can drink Ghirardelli's Ground Chocolate when other beverages would be out of the question. Tell the grocer to send you a can today. Serve it for tomorrow's breakfast, and note how pleased the family will be and how much more vim than ordinary they'll have to begin the day's work. Very economical.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

Citrus Fruit Market

LOS ANGELES, Oct. 7, 1914.

Possibly about 10 cents better price is being received for good Valencias than last week. Conditions are generally quiet. It now appears that the orchards will be cleaned up of all the old crop by the first or soon after. No definite line is to be had on conditions of Florida fruit, but it will not be long before the new crop will be coming in from that section. There will be bu little shipping from California of new navels before the 10th or 15th of November.

Mediterranean lemons are not being received so liberally as formerly and the market generally is in fair condition.

Shipments

Shipments of oranges to date from Southern California since November 1 1914, 37,480 cars, lemons 2781, total 40, 261. To same date, last season, oranges 13,371, lemons 2169, total 15,540 Same date, two years ago, total all citrus, 31,572.

NEW YORK, Oct. 5.—Twenty-seve cars Valencias sold. Market firm Partly cloudy.

VALENCIAS—	Avg
Aurora, Amer. Ft. Dis.	$2.5
Glendora Alps, A. C. G. Ex.	3.6
Glendora Home, A. C. G. Ex.	2.5
Green Hussar, O. K. Ex.	2.3

PITTSBURGH, Oct. 5.—Three cars oranges, one car lemons sold. Weather favorable.

VALENCIAS—	Avge
Stag, A. C. G. Azusa	$3.1
Pointer, A. C. G. Azusa	2.9
Mill Creek, R. H. Mentone	2.8

BOSTON, OCT. 5.—Eight cars oranges one car lemons sold. Clear and warm Market easier on oranges, unchange on lemons.

VALENCIAS—	Avge
Martha Washington, Or. Tustin	$2.7
Cowboy, Or.	2.7
Volunteer, S. A. Pomona	2.8

PHILADELPHIA, Oct. 5.—Four cars sold. Cool. Four cars Florida grapefruit sold, from 35 cents to $3.90 per box.

CINCINNATI, Oct. 5.—Warm, Marke advancing. Three cars sold.

Deciduous Fruit Marke

CURED FRUIT EXCHANGE BULLETI

SAN FRANCISCO, Oct. 1, 1914.

Business conditions generally throughout the United States are no satisfactory, and the cause of this is the unsettled state of the money market, in consequence of which highe rates of interest are ruling and banks are demanding securities and safeguards for themselves which they di not always ask when times were goo and money plentiful. The federal reserve bank has been assisting loca banks throughout the country, expecting that they in turn would help peopl in their various localities and maintain as low a rate of interest as they reasonably could, but it appears tha many banks, instead of letting this money out to assist their patrons, have been holding it up, which makes the money situation extremely tense. Mr McAdoo, the secretary of the treasury says that if the large amount of loanable funds that is kept from active employment were invested in agricultural or commercial paper, or loaned on proper security, the present situation would be greatly relieved. He also states he is using every just effort to persuade the banks throughout the country to extend reasonable credits at reasonable interest, to meet the existing unusual conditions created by the European war.

While there is plenty of money in the country every one is holding on to it in spite of the efforts of our government to distribute it around, but we feel that eventually our governmen ill bring order out of chaos.

This condition, coupled with the fact iat the German market, which has al- ays been a good consumer of our uit, is now denied us, has had a de- oralizing effect on the fruit market. letter received the other day from ie of our foreign agents states that ieir people would not pay fancy prices r apricots, as they could not afford to iy luxuries.

The apricot market remains about ie same, with possibly fancy and ioice being held a little firmer, but iles are very slow. We are moving iis variety whenever we are able to et a price that we think shows a lit- e profit, but we have not cared to ac- pt prices at which our competitors e selling, feeling that there is a pos- bility of a lighter crop next year and iat the holdover, if any, may bring tter prices.

There is very little interest being iown in peaches, sales being slow. ie southern states, where generally aches have been sold liberally, are iying very sparingly, and only for eir immediate needs, and are not in- ilging in any speculation whatever. iey state that there is very little de- and, as farmers have not been able get money to pay for the harvest- g of their cotton crop, which is one the large crops of the South, and tters are being sent out all over the untry, asking people to buy a bale cotton at 10 cents per pound, and ating that cotton growers would re- ice their acreage one-third for 1915, as not to have an oversupply.

While times are not good in Califor- a (other states are worse off), mem- rs of this organization are moving eir crops and getting their money.

Prunes the last few days are easier, account of advices that the French op has been harvested and is being ld at prices lower than we have been lling for. It is reported that the rench crop is of very good quality id that it will probably aggregate out 1000 cars. We are advised that me cars of French crop have been ld delivered in New York, which fact is caused dealers to hold back on eir orders for California prunes until ich time as the market steadies. We ill later, probably, be able to sell unes to England, but more than like- at prices lower than now being ioted. The freight rate from Bor- aux, France, is only 25 cents per vt. (112 pounds) to England, against e higher rate that we have to pay.

Pears are also in limited demand by iyers, and we are informed that some rge speculators who have contracted uit from growers have refused to ac- pt same when ready to deliver.

The very fact that the dried fruit arket is in such an unsettled condi- on is the strongest kind of a reason hy growers should be more strongly iited than ever, for by being united id working in harmony they are in a isition to safeguard their interests ainst the speculator whose only ob- ct is to buy as low as he possibly n and who cares not for the pro- icer whose capital is invested in the il and who pays the interest of that pital by years of hard work and end- ss worry. The farmers are the hard- t men to get together in a coopera- ve movement because they do not alize that in union there is strength, id the stronger that union, the ronger the farmer becomes, making m the master and not the servant, id until the time comes when they e this, they will be besieged by specu- tors who are anxious to take every issible advantage of them, not car- g whether they make any money or it, so, Brother Farmer, brace up and ht for your rights, which you can- t help but get if you stand together, r might and right cannot fail. Every rmer must learn something of the ull together" spirit, and must also arn to give up something for the mmon good, before we can attain e highest results. As President Van ize of the University of Wisconsin its it:

"If two people agree to cooperate in gard to any matter it means that ch one surrenders some of his free- m. Cooperation means the rule of e majority, and that every man who ins in the cooperation must abide by e conclusions reached; not only this, it the business officers of an associa- on must have delegated to them the cessary power to carry on the af- irs of the cooperative body in the me efficient and authoritative man- r that those do of any ordinary cor- ration.

"In order to have the cooperative ovement succeed, the farmer must ree to circumscribe his liberty in any respects, and, furthermore, must e up to his agreement."

WATER PIPE
CHEAP
200,000 FEET
All Sizes—Immediate Delivery.
Just received several carloads new id second-hand Water Pipe, Oil Well id Water Casing. Water pipe (per ot), ½-inch, 2½c; ¾-inch, 3c; 1- ch, 4c; 1¼-inch, 5c; 1½-inch, 6c; inch, 7c; 3-inch, 15c. O. D. Casing er foot), 2-inch, 6c; 3-inch, 12c; ½-inch, 15c; 4-inch, 17c. Riveted pe (per foot), 4-inch, 12c; 10-inch, c—also surface irrigation pipe. any other sizes to select from. rompt shipment. Write, wire or one. Adams Pipe Works, 2030 Bay t., Los Angeles, Cal. Phones: roadway 1264—F1917. (Under en- rely new management.)

All this needs to be kept in mind. The savage can have his own way until somebody kills him or robs him, but civilized man, for the sake of safety, surrenders certain privileges to sheriffs, judges and governors, and enlightened man, for the sake of progress, surrenders other privileges to health and school officers and so on.

If you are going to make cooperation a success you will have to drop that mean feeling against your neighbor. You must allow that the majority can decide things as well as you can, and you will have to ask yourself, "Why cannot I agree with my neighbor, instead of always trying to fight him?"

The best cooperation is a friendly spirit and a willingness to help each other. Talk to your neighbors who do not belong to our organization; tell them the good we are doing and hope to do; tell them the plain truth and get them to become one with us.—California Cured Fruit Exchange.

PLANTING NOTES

(Continued from Page 344)

vive the dry hot summers, it becomes a mere incidental, and cannot be urged as a reason for not using the pepper tree on streets and highways.

Plant Windbreaks

In scores of trips from Los Angeles to Riverside over the Salt Lake route I have for years watched the development of the district of which Wineville is the center. A few years ago it was one vast stretch of shifting sand dunes. Today it is an equally great stretch of profitable vineyards. Windbreaks and vines have broken up the "ground currents" so that vines and other plants are no longer buried by sandstorms.

Years ago the Hollywood district was known as the "Windy Cahuenga," now it is a quiet vale of beautiful homes. The transformation came through extensive planting of trees. A score of years ago Garvanza, in the northern end of Los Angeles, contained sand and gravel dunes swept by coastal winds, for though 25 miles inland it lies higher than intervening territory and the winds struck the surface with heavy force. Now, by reason of planting in Highland Park and of every street in the district proper, Garvanza is positively the least windy portion of Los Angeles.

The lesson to be learned is to plant trees everywhere, especially along our highways. Years ago, Golden Gate Park in San Francisco was such an active stretch of sand dunes that no tree could be grown. Grasses were planted or sown while the sand was wet. Then trees were planted inside rings made of brush and weeds, until finally the sand was stayed and permanent trees of a better class planted. With such examples before you do not hesitate to plant trees.

Rural Station Grounds

It may be that embellishment of the grounds about your home station may be the best, or indeed the only means of calling attention of the travelers to your community. No matter if it be on trolley or steam road the beauty will be equally appreciated. Cannot you take the matter up with the local agent with a view to improvement? Either he or higher officials will listen, for such ornamentation is a goodly asset and attraction for the railroads, enhancing the beauty and value of all points, whether otherwise interesting or not. Traveling becomes very, very monotonous to the cross-country tourist, and every little bit of brightness or beauty is appreciated. The tree lovers in recent convention at Riverside urged all chambers of commerce to take up this question with the railroads.

Schoolhouse Sites

Some time ago I visited a school yard of large size but where the building was placed only 30 feet from the front sidewalk. This allows no scope for variety of treatment; in fact no chance for any fine embellishment on the front. In grounds 300 to 400 feet deep the building should be placed 100 feet back. There then remains plenty of rear space for a baseball field. If there is a chance of broken windows a screen of strong wire should be placed over the windows in danger. Another school visited had the building but 60 feet from front on a 350 feet range, and but one entrance in front. Proper entrances should be made on all sides.

The Firestone Tire and Rubber Company, whose advertisement appears in this issue, offers a very neat and attractive waterproof inner tube bag, which will be sent free to anyone who mentions that they saw this advertisement in the Cultivator. If you have use for one of these waterproof inner tube bags look up their advertisement in this issue and write them, stating you saw their offer in the Cultivator, and a sample will be mailed to you free.

Ground Limestone
for
Agricultural
Purposes
WESTERN ROCK PRODUCTS COMPANY · SAN FRANCISCO · WESROCK QUALITY
When land begins to need lime it is a waste of time and money to continue cultivating it until this need is supplied, for the economical use of every fertilizing material including manure, depends upon the lime supply. If this is deficient everything else must fall short of its possible attainment.
Our ground limestone for fertilizing is made of the highest quality of lime-rock obtainable, is an honest material, honestly prepared. It is ground to that fineness which the Agricultural Department recommends as rendering the greatest efficiency.
You can get prompt deliveries from us either in bulk or packed in 100-pound sacks. Write us for further information, prices, terms, etc.

harvesting with a Yuba

Ever lose a crop because you could n't get the horses and men you needed for harvesting?

The Yuba Ball Tread Tractor is a one-man machine. Any farm-hand of average intelligence can operate it and keep it in condition.

High-grade materials and careful construction cut the danger of break-downs to a minimum.

THE YUBA
BALL TREAD TRACTOR

It is built to haul a combined harvester equipped with auxiliary power for driving the cylinders.

As a stationary power plant it will drive a big thresher.

For harvesting, as well as other farming operations, The Yuba Ball Tread Tractor is a labor-saver and cost-cutter.

There is a booklet telling how and why.

LOS ANGELES October 15, 1914 SAN FRANCISCO

Many Pecans Planted in California

The smaller tree at the reader's left is a Success pecan three years old, growing at Elk Grove. Mr. Claud Tribble is standing by the tree. This tree had but limited care, but was near head ditch and at three years bore several nuts. Tree at right is an older one, but the top which was grafted in is also three years old and bore several nuts the second year.

TREES

Thirty years of knowing how Makes Roeding the leader now.

Our more than 30 years' experience in the growing of reliable nursery stock of every description is at your disposal.

We grow everything that grows, fruit and ornamental trees, vines, shrubs, plants, etc.

GET STARTED RIGHT

It always pays to get a good start and this is particularly true when it comes to planting nursery stock. It costs no more to plant, irrigate, cultivate, prune and take care of GOOD nursery stock than it does of the inferior kind. It is also REAL ECONOMY to investigate in advance the kind of trees that are best suited to your particular soil and climate.

We Make No Charge for Consultation

We want you to feel perfectly free to consult with us at any time. We are always glad to advise with prospective customers and help you to decide on the MOST PROFITABLE variety for you to plant. Send us your probable list or tell us what you think of planting. Tell us the nature of your soil or other special conditions and ask for our suggestions. Our close, intimate touch with markets and a thorough knowledge of what is best suited to every locality will be of value to you. Write us today.

The Pecan Beautiful and Profitable

If Right Varieties are Selected the Pecan Proves a Good Bearer in California. Has Succeeded for Years in many Southern Sections. Mr. Claud D. Tribble Writes for Cultivator Readers of Some Particular Varieties Which Have Done Well in This State

The great success in pecan growing in the southern states has awakened much interest among California horticulturists and many plantings have been and are being made throughout the state. The great production of individual pecan seedling trees in many parts of the state has been the incentive for planting the very best varieties.

Taken from all points of excellence the pecan is superior to all other native nuts and certainly it is surpassed by no foreign species. Horticulturists realizing this, the pecan is being planted very extensively. Its importance as a source of horticultural wealth is being realized.

As a shade and ornamental tree we are much impressed with the upright, symmetrical growth, its immense size and age in its native forests and also the great size of many California specimens. If planted in orchard form the land may be interplanted with other crops or fruits for several years, thereby reducing the cost of maintaining the orchard and adding a source of profit as well.

While the pecan is of the same family as the walnut, so far all experiments in grafting, budding or hybridizing have failed. It is very difficult of propagation by budding or grafting. The most skilful propagators are content with 75 per cent of buds and grafts, and this is seldom realized. In the Southern states propagation is easier by budding, while in California grafting gives better results. Seedlings never bear till 12 years and many not till 18 years. Nursery grafted trees usually bear from 3 to 6 years from planting. Seedlings seldom if ever come true to seed. Scientific propagators all agree that they never come true. Like the walnut, they bear the stamens and pistils in separate flowers. The pistillate flowers, being receptive, may be pollinated with staminate flowers from a distance. Thus the seed could not come true; the pollen may be carried over a mile. In view of this fact the only way to secure good varieties and production is to plant grafted trees of the finest varieties. The large pecans called paper shell are worked upon the seedling pecan stocks, and in California a few nurseries are working them on seedlings of vigorous, heavy bearing trees grown here. The success of the orchard depends greatly on the vigorous stocks.

The pecan will succeed on a wide range of soils but does not seem to mature in our coast climate. The warm climate of the Sacramento, San Joaquin and lesser interior valleys produce it to perfection. It is at home on the rich alluvial soils of the river bottoms. We also find the seedling trees on heavy adobe soil, and while they do not attain the size they would on the richer soils, they are thrifty, and individual specimens bear heavily. The pecan must have plenty of water during its growing season and does well in land that would be too wet for walnuts. Cultivation and fertilization must be thorough if success is to be had.

Mr. H. E. Van Deman, the largest grower of pecans in the world, and said to be the best expert on this nut, while attending the California Fruit Grower's Convention at Stockton in December, 1910, was asked if the pecan would succeed in California. He replied: "As to the pecan in California, I fully believe it can be grown on your rich soils. Samples shown me gathered from trees in your city this morning, prove positively that they will grow and mature in your state, which is one of the very essential points. Large nuts with plump meats which part freely from the shell are the only kinds that should be grown. The only way to go about this intelligently and successfully is to get grafted trees of the well known choice varieties."

He was asked, "Then your advice is to try the pecan?" He replied, "Yes:" Mr. F. B. McKevitt, manager of the California Fruit Distributors, then stated: "I want to say that the pecan is now growing in this state in many localities. I have seen as fine trees growing at Chico, Vacaville and Visalia as any one could wish to see. Trees have been grafted of late years, and we are going to produce just as good pecans in this state as elsewhere. I believe California is better adapted to the growth of the pecan than any other part of the United States. I am informed that the trees at Chico, which are perhaps as old as any others in the state, never miss a crop, while in the southern states they have their off years and frequently miss a crop." Mr. McKevitt has since proved his faith in the pecan by planting it quite extensively on his place near Vacaville.

Mr. Rixford of the department of agriculture informs us that there are 14 acres of seedling pecans planted near Stockdale, Kern County, which never fail to produce abundant crops. Individual trees at Stockton and Farmington produce regularly from 250 to 300 pounds of nuts per tree. They are seedlings and the nuts are small. The local demand can not be supplied from these trees. Our attention has been called to many other heavy bearing trees. Of the California seedlings that have particular merit as to quality of nut, one is located on the Bidwell place at Chico, and compares most favorably with the best varieties of the southern states, and its propagation is being taken up by the United States department of agriculture. Near Winters, on the old Wolfskill homestead, are two trees of great bearing qualities. Mr. Lawrence H. Wilson sent up samples of these pecans and wrote: "These two trees produced over 800 pounds of nuts like the samples, and the wind had blown off many before they were mature." The nuts from these trees, while small, were of fine cracking quality, the meat separating freely from the shell and of the very best eating quality. We called the attention of Mr. C. A. Reed, pecan expert of the department of agriculture, to these pecans and he wrote; "While the nuts are not large they have good cracking qualities and excellent flavor. The great production of these trees, together with the quality of nuts, makes them of interest to us, and we are glad to have our attention called to them."

Grafted trees and top grafted trees are bearing in many parts of the state. Mr. Roeding of Fresno writes; "My grafted pecan trees are bearing well, especially taking into consideration that they are cut very heavily for scions." Mr. C. B. Cunningham of Mills has planted some nursery grafted trees of the Stuart variety and these are bearing very young. At three years old they produced several fine clusters and the trees are growing very rapidly. Trees top worked to the Stuart variety on Mr. Foulk's place near Elk Grove bore the second year and the third season produced a number of clusters of five nuts each. Mr C. A. Reed visited these trees last season and was much impressed by their production. In our own experiments we have tried all the leading varieties, and from such observations as we have made believe the Success, Stuart and Delmas to be as well adapted to our conditions as any varieties to be had. The Success has borne clusters of eight nuts, all filled, the Stuart clusters of five, and the Delmas from five to seven in clusters. All bear well for age of orchard trees and top grafts.

Late plantings of trees are being made in nearly all sections of these valleys, and it is only a matter of time till California will not only supply our own markets, but compete with the southern states for the world's trade in the finest pecans that can be grown and teach the discriminating public the difference between the large fine paper shell pecans and the uneatable, corky, polished specimens now to be found in the stores. When this is done there will be no market for the latter.

Alfalfa in the Orchard

Wm. M. Bristol Takes Up Discussion Suggested by Mr. Mills: "Does the Growing of Alfalfa in the Orchard Offer a Solution of the Soil Problem?"

In a recent issue of the Cultivator Mr. J. W. Mills mentions the fact that some years ago I sowed alfalfa in my navel orange grove, and adds that as he never heard the sequel he presumes the results were not satisfactory. This allusion at the close of Mr. Mills' very interesting article on the humus problem implies that it is my duty to tell what I know on this important subject. I hasten to say, however, that if I confine myself to what I know I shall finish in a dozen lines. Hence I shall digress into what I believe.

I believe that in the growth of various cover crops in the fruit orchard lies the solution of several of the difficulties with which the fruit grower in warm climates has to contend. It may be said that nature has two methods of loosening and leavening the soil. In northern climes the old nurse of earth does it by freezing and thawing. In the south she accomplishes it by a winter growth of vegetation. In January of last year the orange growers of California came nearer a test of the former's method than they cared.

It is true that I tried alfalfa in a part of my orchard—about eight acres—where the soil is red and underlaid, in places, by natural hardpan. This area had been fenced for poultry, and a large flock of chickens and turkeys had ranged over it for a couple of years. There is a popular notion that the combination of fruit growing and poultry raising on the same piece of ground must surely be a good thing; but, like many another day dream, there are weak links in it, for the poultry prevent the growth of cover crops and thus, in turn, prevent the leavening of the soil by the only natural process given to this region.

But stay; I have forgotten another—the earth worm. Here again, however, the poultry interfere with nature's provisions, for they diligently follow the implements of cultivation and devour the husbandman's best friends as fast as the plow turns them up.

After two years of the poultry regime my red soil was like unto an eight-acre sunbaked brick, and I saw that a radical change must be made. I sowed alfalfa broadcast, furrowing out immediately after the seed had been lightly harrowed in. A year later the alfalfa was plowed under, having been mowed only once. The land is on a rather steep slope and therefore necessitated the use of a scythe in cutting—and it is an enthusiast who can swing Father Time's scepter over an eight-acre hillside as often as alfalfa demands.

As to the effect of the alfalfa on the soil I can say that it was very plain, the ground afterward taking water more readily and the trees showing a new interest in life. I intended to repeat the venture in a different way, sowing alternate lands only in the orchard and letting the alfalfa grow two years in order that the roots might make larger and deeper holes in the hard soil. I have delayed this, however, because I have been engaged in another experiment on the land in question—a venture whose cost runs into hundreds of dollars per acre, but which, so far as carried out, has effected a transformation, the story of which is comparable to an Oriental tale.

This venture is nothing less than covering the red soil with a six-inch layer of loose soil hauled into the orchard by wagons. Changing the face of nature? Yes; and to those who have seen the trebled number of oranges on the trees, and their doubled size, it is plain that we have made the old nurse smile. But I am not sticking to my text.

The effect of the alfalfa while it was yet growing in the orchard seemed to indicate that it drew largely on the

Every Rancher should own a Western Gas Engine

The Western Meets Every Requirement

No matter how severe your power requirements may be, the Western will meet them fully and will show the greatest efficiency, dependability and durability.

The Western is of simple construction, compact and get-at-able. Its simplicity and ease of control make it especially desirable for ranch work. Each Western is thoroughly tested before leaving the factory, and it must develop from 20 to 40 per cent more horse power than that at which it is rated.

One-third of a cent per horse power per hour is all it costs to operate a Western when a Special Gas Oil at 2¾c per gallon is used.

Write for our Illustrated Catalog. It's free.

nitrogen in the soil, for the trees took on a lighter green in the fall, and the oranges when weighed at the packing house averaged 10 per cent heavier than those from adjacent groves. I have no reason to doubt the statement of our agricultural scientists that leguminous plants take nitrogen from the air, but it is plainly apparent that they are better pleased to find it in the soil. I applied no fertilizer while the alfalfa was growing; perhaps if I had used some nitrate the effect of the alfalfa on the trees would not have been so marked. Whatever pale green means aboard ship or on the rail, in the orchard it is the signal of distress. It was to overcome this condition that I decided to have alfalfa growing only in alternate lands, plowing under every two years and sowing the lands which, in the meantime, have been under cultivation.

All of this logic and planning, however was tentative, and now that I am ready for an intensive cover crop campaign, two new candidates for the office of soil leavener have entered the lists. I refer to Melilotus indica, the annual sweet clover bearing yellow blossoms and which grows in the winter season, and Melilotus alba, the biennial variety which bears a white flower and makes its principal growth in the summer. I have had no personal experience with either of them, but two Highland neighbors, R. S. Thompson and C. L. Frazer, have plots of the alba which were sowed late last spring and which are now covered with dense masses of verdure which will shortly be plowed under.

In response to my question, "Why don't you let it grow two years, cutting it and plowing under the hay in alternate lands?" Mr. Thompson referred to the new declaration of the soil scientists that dry vegetable matter upsets in some way the favorable nitrogenous conditions in the soil. I confessed that I had not heard of this newest promulgation of our soil experts and admitted that I was born in a state which borders on Missouri. There are people in this region who are buying straw and cheap hay to spread in their orchads in lieu of stable manure. If there is any well-founded objection to the practice I think it the duty of some one to warn them.

As I write I have before me the circular of an Iowa seedsman, headed "Truth About Sweet Clover," which reads, in part as follows:

"Sweet clover is used as either a feed crop or as a fertilizer to plow under to improve the soil. It is equal to red clover or alfalfa to plow under, makes a larger growth than either, grows faster and is easier to start.

"It will thrive on almost any kind of soil. It will grow on any soil that will grow clover or alfalfa and on many soils that will not grow either. It will grow and thrive on thin, sandy soil, hardpan, gumbo, rocky upland, clay and alkali land.

"Sweet clover lives two years. It makes large, rapid growth the first season and can be cut for hay or pastured the last half of the summer, but does not bloom or bear seed. The second year it blooms, bears seed and dies. Can be plowed under either the first year or the second year. It makes a heavy yield of seed which can be either threshed or hulled.

"It seems to do best sown very early in the spring, either alone or with a nurse crop of small grain. Use 10 to 15 pounds of seed per acre. Cover very shallow. It can also be sown on pasture or rough land, right on top of the ground without breaking up, and is often sown on such land in the winter, especially the unhulled seed. The freezing and thawing seem to make it grow better.

"We have never found it necessary to inoculate to get a start of sweet clover. On the other hand, it starts very easily, soon shows a good supply of the helpful bacteria nodules, and as they are the same breed as those on alfalfa, it inoculates the ground ready for alfalfa.

"There is no danger of its becoming a pest. Our seed is northern grown. Southern seed is less hardy and more likely to contain dangerous weeds, especially Johnson grass.

"The only variety recommended is the big white, Melilotus alba. We do not grow or advise the yellow."

So much for a northern man's estimate of Melilotus alba. It has been suggested that the two varieties used in summer and winter, respectively, may make a strong team for the California orchardist. For those who doubt the summer and winter growing characteristics of plants so nearly related it is only necessary to allude to the beans and the peas, which are closely related and yet flourish in summer and winter, respectively.

Present-day tillers of the soil discourse knowingly of things they know only by hearsay. We talk of soil conditions, but, even with the aid of the soil chemists, are not positive concerning their causes or their cures. But nearly every owner of an orange orchard twenty years old knows that something must needs be done to rejuvenate his trees. Rotation of crops is counted not only good practice, but absolutely necessary in ordinary farming. If it be true that any certain plant poisons the ground for itself if grown for years on the same land, it follows of necessity that the orange tree must do the same. In other words the decadent condition of our trees may not be due alone to the compacted state of the soil following years of irrigation and tramping. If this is true the growth of cover crops is, to all intents and purposes, crop rotation.

A few years ago the six-horse subsoil plow was much in demand. My limited experience with alfalfa leads me to believe that it, or some other deep-rooting legume, will loosen the soil more deeply, more systematically and more cheaply than any mechanical implement, at the same time improving both its physical and its chemical condition. The growing of a summer cover crop will require a greater outlay for water, but if the water is available its price may well be drawn from the fertilizer fund and without fear of regret for the transfer.

CYANIDE INJURY AND BORDEAUX PASTE

Written for California Cultivator by H. J. Quayle

The attention of citrus growers and fumigators is called at this time to possible cyanide injury where fumigation follows the treatment of trees with Bordeaux paste for gummosis and scaly bark. It has been known for a number of years that serious injury is likely to result from fumigation following Bordeaux spraying. The injurious action in such cases is easily explained and accounted for, but it was not sus-

pected that injury would result where Bordeaux paste was applied simply to the trunk and larger branches. Many cases have been observed during the present season, however, where fumigation injury has been intensified on trees that had the Bordeaux paste on the larger branches. Where the paste is limited strictly to the trunk no increased injury occurs so far as observed, but since injury has been noted where the paste occurs but a very short distance on the branches, it is suspected that even where the paste is limited to the trunk, the tree may also be rendered slightly more susceptible to injury.

It is not the purport of this statement to advise against fumigation because trees have been treated with Bordeaux paste, but simply to call attention to the fact that trees so treated seem to be more susceptible to fumigation injury. In most of the cases noted the Bordeaux paste was not the only factor in the injury. Bordeaux paste on the branches and high humidity has been the most usual combination where injury has resulted and in the case of unhealthy trees. Whether the moisture acts directly upon the paste is not known. It is more probable that since moisture under normal conditions increases danger of cyanide injury, the limit of safety is more quickly reached with Bordeaux treated trees. Where trees are to be treated with Bordeaux paste during the present season it would be best to delay this treatment until after the trees have been fumigated.

Spraying trees with Bordeaux where fumigation is to follow the same year should be absolutely avoided. Where the trees are sprayed for a foot or two up from the ground for brown rot and where fumigation follows, there will also result very serious injury to the entire tree. Where Bordeaux paste is limited to the tree trunk there has been no increased injury so far as observed. Where the Bordeaux paste occurs on the trunk and up into the larger branches the tree is more susceptible to injury, and fumigation should be carried on carefully when weather conditions are such as to make cyanide injury more likely under ordinary conditions.

A WORD ABOUT POTASH

A believer in the application of nitrate supplies the following as a possible temporary solution of potash shortage:

The European war having put a stop to shipments of potash salts from Germany to this country, we find some of our friends disturbed over the likelihood of not being able to get potash with which to plant their spring crops.

Potash is one of the three elements most essential to plant growth. Practically all soils suitable for farming contain potash in available and unavailable form. As plant life takes potash only to the extent of its needs, if there is any excess in the soil it will remain until used, as potash does not leach out of the ground. Fortunately many farmers have been using potash in increased amounts each year, so that the soil is better supplied with available potash than was the case a few years ago, and there probably remains in the soil a supply which has not been assimilated by the crops.

The problem of the individual farmer is to conserve his potash, which can be done in the following way: Green manuring or turning under a cover crop, dressing heavily with barnyard manure, balancing chicken manure with nitrate of soda and acid phosphate, saving wood ashes to mix with nitrate of soda and acid phosphate, rendering inert soil potash available.

Nitrate of soda will do more than any other agent to render soil potash available. The potash that can be made available in the soil is usually in the form of hydrated silicate of potash and alumina. The nitrogen in nitrate of soda, having been assimilated by the plants, leaves a residue of soda which acts on the hydrated silicate of potash and alumina and renders the potash available. As the amount of potash which can be made available in any soil is quite limited, the process of freeing it is only a temporary measure to meet an emergency and it must eventually be replaced. Every 100 pounds of nitrate of soda will split off 50 to 55 pounds of actual potash and assure successful crops for a time where no additional potash is used.

Organic ammoniates such as blood, cottonseed meal, etc., will not render soil potash available, and in the absence of potash nitrate of soda should be used as the sole source of nitrogen or ammonia in all formulas up to and including three per cent.

THE CAROB

"The popular name for this tree in Palestine is the 'locust,' and the fruit is known everywhere as the 'bread of St. John,'" writes Dr. De Hass in the Journal of Agriculture. "In Arabia it is called carob, from the horn-like shape of its pods or fruit. These pods are sometimes called 'husks,' and without doubt are the 'husks' the prodigal in his distress would fain have eaten. This tree is found all over Palestine. It is a dark evergreen with heavy foliage, affording a delightful shade, and bears a crescent-shaped bean about six inches long and one inch wide. The fruit is fed to horses, cattle and swine. The trees are generally registered; property in them is capital, and marriage portions are frequently given in locusts, or the fruit of the carob. The fruit, when ripe, contains a sweet pulp, which is compressed and made into honey, called 'dibs,' which is the honey in general use among the peasantry of Palestine."

UNITED STATES OF EUROPE

A day will come when the only battle field will be the market open to commerce and the mind opening to new ideas. A day will come when bullets and bombshells will be replaced by votes, by the universal suffrage of nations, by the venerable arbitration of a great sovereign senate, which will be to Europe what the parliament is to England, what the diet is to Germany, what the legislative assembly is to France. A day will come when a cannon will be exhibited in public museums, just as an instrument of torture is now, and people will be astonished how such a thing could have been. A day will come when these two immense groups, the United States of America and the united states of Europe, shall be seen placed in presence of each other, extending the hand of fellowship across the ocean.—Victor Hugo.

The Tires Men Want

You'll Be Glad When You Get Them

You don't know what you miss—you men who are buying other than Goodyear tires.

All this sturdiness, this safety, this trouble-saving—you are bound to demand it sometime. Why not in the next tire that you buy?

How They Excel

It is evident that Goodyear tires excel. They hold top place in Tiredom—outsell any other. And none but the best tire built could do that, after millions have been used.

Their advantages are these:

The No-Rim-Cut feature—which we control—makes rim-cutting impossible. Tires which rim-cut mean enormous waste.

Our "On-Air" cure—used by us alone—ends a major cause of blow-outs. This one exclusive process costs us $450,000 per year.

Our rubber rivets—formed by a patent method—reduce by 60 per cent the risk of tread separation.

Our All-Weather tread—used on Goodyears alone—is a matchless anti-skid. It is tough, double-thick and enduring. It is flat and regular, so it runs like a plain tread. It grasps wet roads with deep, sharp, resistless grips. No wheel should be without it.

Say That You Want Them

Say to your dealer that you want Goodyear tires and you'll get them. Then your major tire troubles will be wiped out or minimized. Hundreds of thousands have proved this, and have adopted this Goodyear tire. You'll be glad when we get you to join them.

DORMANT AND NON-DORMANT FREIGHT RATES

Written for California Cultivator
By Chas. A. Chambers

As secretary and manager of the Fresno Nursery Company, I was constantly annoyed during the past nursery shipping season by the variation of freight rates when receiving and making shipments of nursery stock. It seems the railroad companies have made classes of dormant and non-dormant nursery stock, which has caused the confusion and annoyance. On some shipments we were charged first class rates, on others double first class rates, and when the railroad companies were asked for an explanation they claimed that dormant and non-dormant conditions covering shipments in question were the cause of this variance. You can imagine how watchful one has to be to keep track of all shipments when paying freight bills to prevent being overcharged. The railroad companies have been claiming that an evergreen tree, plant or shrub, inasmuch as this class of stock retains its leaves, should be classified as non-dormant, while trees, plants or shrubs of a deciduous nature or those that drop their leaves are dormant. This ruling is rather hard on the nurseryman and planter and, I contend, an imposition.

An evergreen tree, particularly a citrus tree, is invariably balled. In the case of an orange tree, the roots are covered with a ball of earth, wrapped in a burlap covering. This ball usually averages at least 25 pounds. It seems to me where we are paying freight on a lot of mud, presuming that an evergreen tree is non-dormant, that we are paying enough freight at the regular nursery stock rate, without having an additional amount to pay simply because a tree happens to possess leaves.

Dormancy does not mean on the verge of death. A deciduous tree, while it does not show any leaf growth when removed from the nursery, is not different from the evergreen tree because the latter retains its leaves. The sap in a deciduous tree is just as much alive as the sap in an evergreen. An evergreen tree is rendered just as dormant as a deciduous tree when the roots are cut to enable it to be balled and taken up for shipment. If grown in a pot for commercial purposes the tree or plant so grown, inasmuch as the roots are hampered and cramped in a small container, is more or less dormant until actually given its freedom by being removed from the pot and planted in the open. I think that every nurseryman will bear me out on these points. All nursery stock, whether evergreen or deciduous, where the roots are cut for the purpose of taking them up and preparing them for shipment, and where they could not possibly live unless replanted in the open ground, should be classified as strictly dormant stock and entitled to the lowest freight rate quoted on shipments of nursery stock. Tender potted plants that continue to grow and thrive in the container, and those that are not removed from the vessel, pot, can or box they are growing in when received, would be, strictly speaking, non-dormant nursery stock. Everything else in the tree and plant line as described above should be classified as dormant.

The freight rates at the present time are as much as the traffic will bear, and I see no reason to be so strict on classifying nursery stock into so many classes. It is very confusing as well. Very often these so-called non-dormant and dormant trees are packed together—a shipment may contain all dormant trees except one little, measly geranium or two in a pot—and if the geranium happens to stick its head out of the covering the railway company's receiving clerk may chalk up the whole shipment with a double first class rate, claiming that the entire shipment is non-dormant. This is a hard matter to regulate when filling orders for assorted stock. The method of packing should regulate freight rates, as formerly.

This dormancy and non-dormancy of nursery stock reminds me of a happening which came under my notice several years ago. A party in Florida made a shipment of a large box of alligator eggs, packed in coarse sand, to a man in Fresno. The shipment, when leaving Florida, was freight-billed as eggs, taking a certain rate of freight. When it arrived in Fresno a greater part of the eggs had hatched, and instead of a box of alligator eggs, the box contained live alligators, and the rate was changed at destination from the egg rate to the rate charged when shipping wild horses. Perhaps these rate fixers who classify dormant and non-dormant nursery stock got their inspiration from this incident.

Take, for instance, our friend George C. Roeding's blastophagated figs. If billed out as figs they would take the fig rate; if billed as Capri figs with fig wasps, they would probably take the livestock rate, and with each shipment it would be necessary to have a human being accompany the shipment with a first-class ticket, to water and feed the blastophaga in transit. It seems to me that the railway companies should pay more attention to poundage and tonnage rather than the commodity itself.

DYNAMITE FOR TREE PLANTING

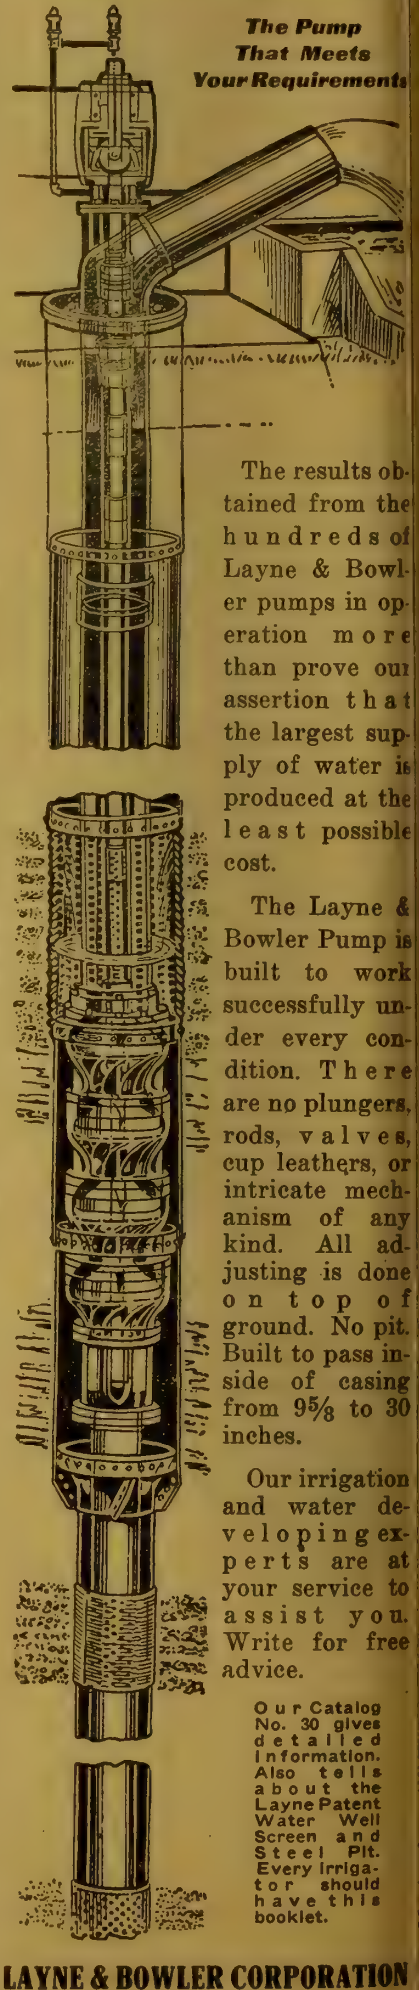
The New Mexico experiment station has issued a bulletin on the use of dynamite on the farm, written by Roland Harwell, assistant in agronomy.

From it we quote a few paragraphs on tree planting:

In heavy adobe soils, such as require quite an excavation in order to secure proper development of the young root system, it has been found advantageous to explode small charges of a low grade slow acting dynamite (20 per cent ammonia), at a distance of from 18 inches to 36 inches from the surface, thus forming a hole for the tree and at the same time loosening the soil to a greater extent, both in surface area and depth, than is possible when holes are spaded.

The charges must of necessity vary with the condition of the soil. There is no "rule of thumb" to be applied in this case. The resistance offered by the soil measures the quantity of dynamite necessary; as does the depth at which it is placed. In general, for the above mentioned depths, the charges vary from ¼-pound to 1½-pound. A little experience and understanding of what constitutes a dynamited tree hole will solve the problem. A few simple experiments always repay the slight additional cost.

An ideal tree hole, strange to say, isn't a hole, after all. Should the operator use a charge sufficiently strong to blow the earth entirely out from about the dynamite, he might be embarrassed by the fact that there would be little dirt left at a convenient distance to replace about the tree. Further, there would be a decided waste of energy in raising the earth to a scattering distance. Once the surface gives way, the expanding gases slip from beneath the soil particles and join the atmosphere, where space is less contested. The ideal hole is produced by charging in such a manner as to raise the surface soil to a height of four feet or such a matter, and then let it fall back in place. This soil, when falling back, will become caught at the surface of the hole, and by giving it a few downward pushes with a spade a hole large enough for the tree will result and plenty of loose earth for packing about the roots will be at hand. In this manner a large radius of dis-



The
LAYNE &
BOWLER PUMP
Secures the Largest Supply of Water
At The
Least Possible Cost
The Pump That Meets Your Requirements
The results obtained from the hundreds of Layne & Bowler pumps in operation more than prove our assertion that the largest supply of water is produced at the least possible cost.
The Layne & Bowler Pump is built to work successfully under every condition. There are no plungers, rods, valves, cup leathers, or intricate mechanism of any kind. All adjusting is done on top of ground. No pit. Built to pass inside of casing from 9⅝ to 30 inches.
Our irrigation and water developing experts are at your service to assist you. Write for free advice.
Our Catalog No. 30 gives detailed information. Also tells about the Layne Patent Water Well Screen and Steel Pit. Every irrigator should have this booklet.
LAYNE & BOWLER CORPORATION
900-910 SANTA FE AVE.

turbed or subsoiled earth will be produced.

The method in some instances can compete in cost with spade holes, with the advantage of much more soil being loosened. As far as known, no harm results from the fumes remaining in the soil for several hours after the hole is made and the tree is planted.

In general, the cost will range from six cents to 27 cents per tree hole, for dynamite, fuse and caps. The labor cost also varies with the soils from one cent per hole to five cents.

The holes for the charge are put straight down, and are one and one-half to two inches in diameter. A bar may be driven down and pulled. A pipe can be driven, its core of earth being removed several times before the desired depth is reached; or an earth auger can be used for this purpose. Generally, the latter method is the best.

In subsoiling for other purposes the method is identical, except that the earth is not lifted so high in the air, and the holes are so spaced that all the soil of a given area is loosened. This spacing varies from four feet, zigzag to ten feet. The condition of the soil determines this, the heavier clay soils requiring the closer spacing. The method is expensive, and only to be used where cheaper methods fail.

FRUIT CROP OF WASHINGTON

The Washington state department of agriculture has issued a report estimating fruit shipments from all of the leading commercial fruit districts of the state for the present year at 17,000 cars, as compared to 11,895 cars for last year.

The report says that in spite of the ravages of fire blight and other pests, a "good average crop" may be predicted. Estimates of the production of the various districts are as follows:

Wenatchee Valley, Okanogan, Lake Chelan, 6,800 cars.

Yakima Valley, Kittitas and Benton counties, 7,000 cars.

Spokane district, 700 cars.

Walla Walla, Touchet Valley, 900 cars.

Clarkston and Palouse districts, 650 cars.

Klickitat and Skamania Counties, 100 cars.

Stevens and Ferry Counties, 250 cars.

Puyallup Valley, 650 cars.

In addition, the Puyallup valley will ship 470 cars of canned fruit and the islands and lower Puget Sound district 240 cars of berries. The Clarke County dried prune crop shipment is estimated at 1,500,000 pounds.

THE WOOLLY APHID OF THE APPLE

The woolly aphid is one of the most insidious and dangerous of apple pests. It occurs on the roots and above ground, also on the branches. The branch form can be easily controlled by contact insecticides, but it is practically impossible to stamp out the aphids on the roots.

Winter weather of eastern Washington is usually severe enough to destroy what individuals are above ground, so that developing colonies in the spring come from wingless aphids of the roots or crown. These aphids are apt to locate on a bruise of the bark and soon become conspicuous because of a growth of "wool." Their feeding poisons the tree and results in a local swelling and ultimately in a weak tree with small-sized fruit. After a couple of generations some winged individuals appear which migrate to other apple trees, thus spreading the pest. The summer generations are less vigorous, and in early fall other winged migrating individuals are produced. These rarely seek apple trees, but are attracted to elms, if near by, and there give birth to wingless sexual aphids, the female of which produces a single egg, which is laid for the winter deep in a crack of the bark. The following spring the insect inhabits the leaves of the elm, forming rosettes of curled leaves. Its third generation is the winged spring migrant that returns to the apple tree.

The woolly aphid is prevalent on nursery stock, and thus gets access to a new region. Apple stock showing swellings or galls should not be planted, and elm stock should be carefully searched for black eggs. When the woolly aphid occurs above ground it can be destroyed by a light swabbing of alcohol, gasoline or kerosene, or if numerous by a spraying of tobacco-soap, such as is given for green aphis. The underground form can not be effectively reached and is consequently most dangerous. Kerosene emulsion, Sulphur-lime or an abundance of tobacco dust applied to the roots have been recommended, but give only partial benefit. Plowing and cultivation to force the roots down are thought to be helpful since the aphids do not thrive much below a foot. Northern Spy trees are remarkably free from attack, and such stock would prove valuable in a badly infested district. The woolly aphid is too delicate and weak to force its way through the soil, but it will work along cracks and roots and thus spread through the orchard or nursery row. To prevent branch infection from below, the trunk may be banded with equal parts of rosin and castor oil melted together and applied on burlap or cotton strips, or if in a dusty district where this method would be inapplicable, it has been suggested to pack around the trunk of the tree a good layer of sand through which the aphids cannot crawl.—A. L. Melander, Entomologist, Washington State Experiment Station.

There are two kinds of cranks: one is impractical, the other is an expert who pays little attention to the rules others have laid down.

HOTHOUSE GRAPE CULTURE IN BELGIUM

According to a consular report, more than 15,000 hothouses in Belgium are devoted to growing grapes and the annual production is from ten to eleven million pounds. It is said that new hothouses are being constructed each year and that the industry is becoming more and more important. Belgian growers of hothouse grapes who have visited hothouses in the United States consider the methods used in Belgium for growing these grapes, and especially the construction of the buildings and the system of heating, far superior to the American way. It is said that some of these growers are thinking seriously of establishing hothouses for grape culture in the United States, as they consider the opportunity good.

The usual type of hothouse used for growing grapes is 65 feet long, 26 feet wide and seven to nine feet high. They are heated by means of large tile pipes from hot air furnaces built underneath at each end. It is said to cost about $20.00 a month to heat one of these houses during the forcing season, anthracite coal being used as a fuel. The average cost of building a hothouse of this size is $290.00. Wages paid workman average about 67½ cents a day. One hothouse of the size described will contain 60 grape vines and the average production is 775 to 1000 pounds. Peaches, pears, and tomatoes are also grown in large quantities in the same hothouses. One house will accommodate 800 pots of tomatoes. From September to April salad plants are sometimes grown with the grapes in the hothouses, lettuce, spinach and radishes being the most important crops thus grown.—Market Growers' Journal.

Ground Limestone
for
Agricultural Purposes

WESTERN ROCK PRODUCTS COMPANY · SAN FRANCISCO · WESROCK QUALITY

When land begins to need lime it is a waste of time and money to continue cultivating it until this need is supplied, for the economical use of every fertilizing material including manure, depends upon the lime supply. If this is deficient everything else must fall short of its possible attainment.

Our ground limestone for fertilizing is made of the highest quality of lime-rock obtainable, is an honest material, honestly prepared. It is ground to that fineness which the Agricultural Department recommends as rendering the greatest efficiency.

You can get prompt deliveries from us either in bulk or packed in 100-pound sacks. Write us for further information, prices, terms, etc.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Delayed

We ask the pardon of many who have sent queries to the Cultivator recently because of the delay in answering them. Our columns have been so full that the department has been of necessity greatly reduced. It will not be long now, however, until all will be answered.

Dry Mash

I would like a formula for a dry mash for laying hens. Should the same amount of fish meal be used as of beefscrap?—Subscriber, Beaumont.

Fish meal does not quite take the place of beefscrap, so it is customary instead of substituting fish scrap altogether for beef scrap to use half and half.

The "association mash," which is used quite generally in Southern California, consists of (to a ton of mash): 600 lbs. of bran; 400 lbs. ground barley; 300 lbs. shorts; 100 lbs. feed meal; 200 lbs. Kafir meal; 150 lbs. beef scrap; 150 lbs. fish scrap; 70 lbs. fine ground bone; 100 lbs. alfalfa meal; 10 lbs. salt. If you wish to mix this in small quantities the proportions can be reduced to the following: Three parts bran, two parts ground barley, one part Kafir meal, one and one-half parts shorts, one-half part feed meal, one-half part alfalfa meal, three-fourths part beef scrap, three-fourths part fish scrap, one-third part ground bone. The salt is not important, and in mixing a small quantity of the mash I should not bother with it. I have found a mash of two parts bran, one part middlings, one part feed meal (coarse corn meal), one part alfalfa meal, one part ground oats, one part fine beef scrap (or beef scrap and fish scrap mixed) and one-half part ground bone very satisfactory, but it is a good plan, whatever you use, to change it occasionally. The fowls like a variety, and sometimes certain feeds can be bought more cheaply than others. At molting time I add about one-half part linseed meal to my mash formula. It helps the new feathers to grow and is good for occasional use during the laying season.—J. A. K.

A Mustard Problem

A subscriber in Santa Barbara county asks the reason for a short crop of mustard; whether it is the season or soil conditions, and what fertilizer should be used to replace fertility removed by the mustard crop.

In order to help in solving his problem we must have many more facts. If rainfall was so short as to cause failure of the crop on other land known to produce satisfactory yields, the season may be the cause. If rainfall was ample, it is possible that faulty culture methods, which did not conserve the moisture properly, are the reason for a shortage. If all other conditions except soil fertility were favorable, a soil analysis made and interpreted by a reliable soil expert will show the essential elements lacking, and the expert will be able to suggest the best fertilizer and the proper amount to use. He will also be able to analyze the plant and determine the amount of fertility a crop will remove annually. We are not able to find an analysis of mustard in any of the experiment station bulletins or other literature.

State Fair Secretary

A letter comes from Pomona with stamp for answer, requesting the name of the secretary of the state fair, but the inquirer failed to sign any name, so that we are unable to answer directly. However, the name of the secretary is C. W. Paine, and he may be addressed care State Board of Agriculture, Sacramento.

Slobbers

What is the matter with rabbits when they move their jaws up and down and slobber and smear themselves? They will not eat, and I find, upon examination, that the liver is streaked?—Subscriber, Anaheim.

They have that disease which is dreaded by all rabbit fanciers, and which is so prevalent among many rabbitries. To remove the cause keep them isolated from all healthy animals, as it is contagious. This disease is usually caused by those affected being kept in draughts or cold, damp and wet pens or hutches, also where the air is foul or contaminated.

Animals afflicted should be kept in a warm place on a nice bed of clean, dry straw. Unless they are valuable animals, would advise doing away with them, even if compelled to use the hatchet. Think it would be advisable to feed dry feed only for awhile, cutting out fresh, green grass, alfalfa and green vegetables.—R. V. M.

Aphis on Milo

What is affecting my milo maize and sorghum? I send leaf with sweetish substance on it, also many very small insects.—Subscriber, Antelope Valley.

This is an exceedingly bad case of aphis, and the sweetish substance accompanying it is probably caused by the aphis. Spraying with any of the contact insecticides, especially a weak tobacco solution, will reduce the pest, but presume that would hardly be practicable with such a crop as milo. The state insectary has at times distributed colonies of lady bugs, which have proved a valuable aid in controlling the pest.

Mililotus

Would like to know the name of the clover enclosed. It grows very tall and rank and horses seem to eat it, and I would like to know if it would be good forage for milch cows.—Subscriber, Selma.

This is a clover, Melilotus alba. When young and lush think it would be good for milch cows.

Book on Swine

What is the best book on swine husbandry, one which treats of breeding, feeding, handling and diseases?—Subscriber, Turlock.

Probably one of the best is "Swine in America," by Coburn, published by the Orange Judd Company. The Cultivator will be glad to secure the book for the inquirer at the publisher's price, which is $2.50 or, with the Cultivator one year, $3.25.

Grafting Over Peach Orchard

The question involved in the enclosed clipping [in which we spoke of difficulty in grafting over bearing peach trees] has appeared several times of late in your columns. I would like the privilege of correcting a mistaken impression.

I know from much experience that deciduous fruits can be budded over to advantage even when well grown trees. I have found it profitable and feasible in every respect. Ten year old trees are not too old. Usually the buds can be inserted in the heavy bark just as in the case of old orange trees. If this does not take well the second budding may be done in suckers, which will grow from the decapitated limbs in a few weeks. The first budding may be done as soon as the sap flows in the spring and after about three weeks the limbs may be removed. By June there will be good growth to bud into to replace all buds which have failed at the first budding. At the June budding practically everything should take. These may then be forced on so that by fall there will be a good top. Such

trees will bear well the third summer. Having strong root action they will far outstrip any trees that might be planted to take their place. It may be urged that the peach tree is a short lived tree. But is this the case? I have peach trees that are 35 years old that are still bearing from one to two hundred pounds of peaches annually. It is a matter of care, not age. With trees of this age at least one year will be gained by budding them over. The expense will not be much more, either. —E. L. Koethen.

Whitewash.

Please give formula for a whitewash that is durable.—Subscriber, Encanto.

Formulas formerly given in the Cultivator are as follows:

1. Slake fresh quicklime in water and thin it to a paste or paint with skim milk. The addition of two or three handfuls of salt to a pail of the wash is beneficial.
2. Two quarts skim milk, eight ounces of fresh slaked lime, six ounces of boiled linseed oil and two ounces of white pitch dissolved in the oil by a gentle heat. The lime must be slaked in cold water and dried in the air until it falls into a fine powder; then mix with one-fourth part of the milk, adding the mixed oil and pitch by degrees; add the remainder of the milk. Lastly add three pounds of the best whiting and mix the whole thoroughly.
3. Slake one-half bushel of lime in boiling water, keeping it covered; strain and add brine made by dissolving one peck of salt in warm water, three pounds rice flour, then boil to a paste; add one-half pound whiting and one pound of glue dissolved in warm water. Mix and let stand for a few days before using.

Any of the above may be colored any desired tint by adding yellow ochre, lamp black; burnt umber or Indian red. For the formula used by the government on lighthouses and other buildings see Cultivator of August 21, 1913, page 173.

Leaf Spot.

Please tell me the name of the blight or insect working on the alfalfa twig which I send. The alfalfa is in its first season, has been well cared for and thoroughly watered. The lower leaves of the plant are first affected and the brown spots increase in number until the whole leaf is covered and falls off, leaving bare stalks.—Subscriber, Edenvale.

This is leaf spot, a fungous trouble of alfalfa, which has been prevalent this year. Some crops have been entirely destroyed. It is a trouble which will be corrected by warmer and dryer weather.

Bermuda in Alfalfa.

Please suggest best treatment of alfalfa run out by Bermuda grass. I will plow up (shallow) after next cutting. I understand that next year cultivated crops are in order, but this winter could not a heavy crop of hay be raised without the grass gaining much if any? As to detail of working, would you disk thoroughly after plowing or not? Cultivating or harrowing will drag up a lot of stuff that might otherwise rot. As I contemplate the necessity of plowing up the alfalfa probably every five years, wish to work out a good rotation. Land is rich sandy loam and have all the water I can use. Could part of the land be cleaned up by February (by frequent discing), so that there would not be too much trash for potatoes? Your advice would be much appreciated.—Subscriber.

In this matter of rotation we ask subscribers to give suggestions. As a rule sugar beets are perhaps one of the best crops to follow alfalfa, this in case the Bermuda is not too heavy. If Bermuda is very heavy I would fall plow, seed to barley, follow with beans or corn, then sugar beets, alfalfa and so forth. This is a long question and is well worth a conference meeting. Let us have it in the columns of the Cultivator.

Oregon Strawberry.

Will someone give information as to the new improved Oregon strawberry, especially on the point as to whether the flowers are perfect or it is necessary to interset with other varieties in order to pollenize.—Subscriber, Carmel.

We are not acquainted with this particular berry and will appreciate information from those who have grown it.

Advice on Soils.

If we could have a chemist in connection with the Cultivator to answer questions as to soils and fertilizers it would be very valuable.—Subscriber, Carmel.

The Cultivator has access to a number who are qualified to answer questions fully and has often answered queries as to fertilizers and soils. As to soils, there is so much diversity that an analysis is of value only to the owner of the particular piece of soil analyzed and would have no interest for other readers. Any question of a general nature we will be glad to look up for our readers. In the matter of determining soil conditions there are chemists and soil physicists advertising in our columns who will be able to answer personal questions.

Carnations from Cuttings

Please give information regarding growing carnations and roses from cuttings. What is the best month in which to start them? How are carnations pruned?—Subscriber, East Bakersfield.

Regarding reproducing carnations from cuttings, McLaren, in "Gardening in California," says: "In propagating by cuttings use only wood which is short-jointed and carries strong healthy leaves. Dibble them about one inch apart in boxes filled with sandy leafmold, and place them, in March, in cold frames or in a shaded, sheltered spot out of doors. They may also be put in, in a similar situation, in September with equally good results. As soon as they are rooted, transplant them three inches apart into boxes or into a sheltered border until ready for their permanent quarters.

"Where only a few growths of any desirable variety can be had propagation by layering is perhaps the surest of all methods. Layering is effected by simply bending one of the branches or shoots into the soil (after, with a sharp knife, having cut a slit into the shoot on the underside, about half

Deep Wells

A tip to those figuring on buying a deep well pump

First of all satisfy yourself as to the reliability of the firm that makes the pump, then find out the kind of service it is giving to those who have purchased one or more. Both of these points can be easily determined in relation to the Pomona Deep Well Pump.

We invite you to come to Pomona and find out for yourself the advantages of the Pomona Pump.

—see the Pomona Plant.
—see how the Pomona Pump is built.
—see the largest deep well pumping section in California.
—see how we meet the deep well pumping problem.
—study the experiences of those who have spent years of time and thousands of dollars in obtaining the present high efficiency.

If you cannot come to Pomona write for our pump catalog No. 54 "C" and state the depth of your well, etc.

Plant For Big Crops That Never Fail

$UDAN GRASS

You can make your hay crop a certainty—rain or no rain. Profits can be counted from sowing time. One of the biggest, best and safest investments any farmer or stockman can put his time, money and land into.

Sudan Grass—the wonderful new forage crop—will grow in any climate—any soil, except in water-logged land or absolute desert. Has been tried out fully from Washington to Texas. Can't get too much rain or too little.

It gives three to four cuttings each season, yielding from one to two tons of hay per acre every cutting, and 400 lbs. of seed. Produces more and better hay than millet—finer and more leafy than sorghum—doesn't become a pest like Johnson grass. No danger of infesting the land—the roots die at first frost.

Live stock prefer *Sudan Grass* to any other food—it is both nutritive and palatable. Is easily cured and handled as hay and makes splendid ensilage. Has been specially endorsed by the Director of Texas State Experiment Stations.

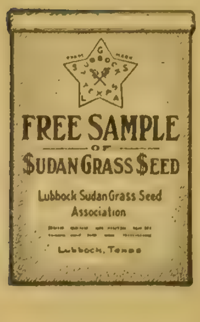
Pure clean seed is necessary to get good results. Adulterated seed will sow your fields with weeds and pests. Our seed is guaranteed to be grown, harvested, cleaned and packed under the most careful inspection. There is no chance of adulteration or bad mixture.

Lubbock Sudan Grass Seed is absolutely pure, genuine and thoroughly reliable. It has been grown under the supervision of Texas Sub-Station No. 8, located in Lubbock County, V. L. Cory, Supt., and every field has been officially inspected, certified to and passed before harvesting.

WARNING—We are the only authorized agents for selling LUBBOCK ASSOCIATION GUARANTEED SEED. Be sure that all seed you buy has our name and trademark stamped on the bag. None other is genuine. This is the only way you can get protection from adulterated seed and insure a profitable harvest.

Put up in 1-2-5-10-25-50 and 100 lb. packages. Retail prices delivered:

1-10 lb.	$1.00 per lb.
11-25 "	.95 "
26-50 "	.90 "
Excess of 50 lbs.	.85 "



FREE Sample Package of Seed and Booklet on request.

The booklet tells the story of *Sudan Grass.* Gives expert directions how it should be sown, grown and harvested to produce best results. Every stockman and farmer in the country should post himself on this wonderful forage. It means money.

Small Fruits Vegetables

VEGETABLE GARDENING IN THE SACRAMENTO VALLEY FOR THE MONTH OF OCTOBER

Written for California Cultivator by S. S. Rogers

The planting calendar for this month includes vegetables which are more or less resistant to frost. Many vegetables can be grown to good advantage at this time of year, planting such crops as beets, turnips, carrots and other root crops which are especially adapted to the cooler weather. There is also each year a large acreage devoted to growing winter peas, cabbage, cauliflower, lettuce and onions. As this month is especially favorable for planting peas, onions and lettuce, the following article, which takes up somewhat in detail the culture of these crops, might be of interest at this season:

Growing Winter Peas

Peas which are planted during this month generally command good prices in the markets, for at the season of the year when they mature this vegetable is somewhat of a luxury. Peas do best on a rather heavy, rich soil, and are suited to many localities through the central and southern portion of the valley.

The preparation of the soil should be thorough before the seed has been planted, and unless there is considerable moisture in the soil it will be found advisable to irrigate thoroughly before planting. The writer has tried several methods for preparing the soil at this season of the year, and the best results were obtained by irrigating, followed by plowing as soon as the land is in proper condition. After being plowed the field should be worked down as soon as possible and planted.

Seed can be sown in drills or in hills from two to three feet apart. The latter method aids somewhat in the picking, and if this is to be pursued, about one dozen peas should be dropped in the hill, planting from one to two inches deep, varying somewhat according to the character of the soil, planting deeper in soil which dries out rapidly than in the heavier soils which retain the moisture longer. The rows are generally planted far enough apart to allow cultivation with horse-drawn implements.

There are several varieties which can be grown, the choice depending somewhat on the local market. The Stratagem, Telephone and Premium Gem will be found very satisfactory to plant. The latter variety is a small pea, although sweeter in flavor than either the other two.

Growing Winter Lettuce

Winter lettuce should be planted during this month, and will be found a very satisfactory vegetable to grow. There are two methods for growing this crop: One is by planting the seed directly in the field; the second by planting the seed in a hotbed or cold frame and transplanting the young plants after they have attained the desired size.

Before the ground is to be planted to lettuce it should be thoroughly prepared, having the moisture well up to the surface and free from all clods. It is better at this season of the year to plant the young plants in raised beds, which have been previously described in the columns of the California Cultivator. If the Los Angeles variety is to be grown, the plants should be set 15 inches apart. If a smaller variety, such as the California Cream Butter or the Hanson, the plants should be set one foot apart. There are several varieties of lettuce grown throughout this valley, but the Los Angeles has been found the most satisfactory.

Culture of Onions

Growing winter onions in the different parts of this valley which are suited to their culture has been very successful. The common method for producing onions at this season of the year is by planting seed in cold frames or in the open, and transplanting the young plants during November or December. The seed is generally planted in hotbeds during September, although it is not too late to plant them during the early part of this month. The young plants should be ready for transplanting during November and December, maturing a crop in the spring, at which time this vegetable commands a good price. In a future issue of the California Cultivator the field culture of this crop will be dealt with in detail.

"SOIL MANAGEMENT"

"Soil Management," by the late F. H. King, D. Sc., published by Orange Judd Company, New York, $1.50 net. The Cultivator will be glad to secure the book for its subscribers at the above price, or including a year's subscription to the Cultivator, at $2.35 postpaid.

"This volume is the outgrowth of the remarkable soil investigations of the late F. H. King, of the University of Wisconsin. Professor King had projected a book on soil management many years ago. For the past ten years he had been assembling material with this idea in mind. His untimely death prevented the fulfillment of this purpose, but fortunately for the agricultural and scientific world his widow, Mrs. C. B. King, has brought together such of his papers and lectures as contain materials that he would have worked into an organized form. His study of Chinese, Korean and Japanese agriculture was part of his plan for the work on soil management, which he was unwilling to put forth until he knew something of this oldest management with its present marvelous results."

It would please us very much if our readers, when they have occasion to write to an advertiser, would say that they saw the advertisement in these columns. Such a statement might operate to the advantage of the reader. Surely it would place him at no earthly disadvantage, so you would better do it.

There are 12 chapters in the book, touching upon productive capacity of fields, principles governing productive capacity, functions, availibility and conservation of moisture, soil moisture and plant feeding, principles and practice of mulches, why lime soils are strong, physical features of soils, development and maintenance of good conditions, conservation and application of water, reclamation of swamp lands. The last chapter touches upon agriculture of three ancient nations and is the work of Mrs. King from notes made by her late husband when they were on their trip through Oriental lands.

The book is almost as fascinating as "Farmers of Forty Centuries," which we doubt not many of our readers have in their libraries.

Not all of the surplus income from the farms should be returned to it in buildings, fences, wells, improved machinery, etc. The home should have its share of improvements, which may be termed an investment. These are an investment, because they bring in dividends in human happiness as a result of comfortable living.

A great many people plant their gardens as they do the farm crops; they plant all at once and have an abundance for a short time and then have nothing the rest of the year.

No burden is so heavy as the one we are trying to shirk.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Citizenship of Wife

May a woman, native of this state, be allowed to register, whose husband is a foreigner with only first papers?—Subscriber.

A woman upon marriage acquires the status of her husband, and is a citizen of such country as that husband may be.

Powers of Railroad Commission

What are the powers of the railroad commission—that is, can the commission break a contract if considered unfair? Does releasing one party on a contract release the other? Is there any appeal from the decision of the railroad commission?—Subscriber, Madera.

The railroad commission has very extensive powers, but the constitution of the United States provides that no state may pass any act impairing the obligation of a contract. It has been frequently thought that the railroad commission of this state has impaired the obligation of contracts, but no case has yet been decided in the federal courts. As a general rule a release from the obligation of a contract upon the part of one party thereto would release the other. An appeal may be demanded from a decision of the railroad commission by writ of review to the supreme court of this state, but if a federal question is involved or if the question arising under the laws or statutes intrudes into the matter, the case may be filed in the federal courts.

Chattel Mortgage

A, B and C take a three-year lease on a ranch and are joint owners of stock and implements. A left the ranch six months ago and has not returned since. He placed a chattel mortgage on said property without the knowledge of B or C, and, as I understand it, swore to an affidavit that he is sole owner of said property. In how far can B and C be held responsible, or can any foreclosure be made on the ranch? The whereabouts of A is not known.—Subscriber.

It is quite important to know whether A, B and C were copartners or merely tenants in common. If they were tenants in common, as appears from the communication, it is clear that one tenant cannot, unless specially authorized to do so, sell or dispose of more than his own interest; and a sale, conveyance or encumbrance upon the property held in common by one tenant would have no effect upon the title or interest of his cotenants in the absence of prior authority or subsequent ratification, expressed or implied, and it carries only the undivided interest of the grantor, whatever the description. Non-signing cotenants may recover the value of their undivided interest or may claim cotenancy with the vendee or mortgagee. The mortgagee of a person's share of firm assets takes subject to all the equities of the copartners of the mortgagee. Of course, unless you take active measures to establish your rights in court you may lose your property. Delay in a case such as you state may be fatal to your case under the doctrine of implied ratification and laches.

Title to Homestead

If a husband files on a homestead would the wife have to live there in order to get a deed to the land? If the wife's health is such she can't live there, can they get a deed?—Subscriber, Riverside.

Residence upon a homestead under United States land laws is absolutely necessary to acquire patent thereto; it matters not where a man's wife's residence is, his residence must be upon the land. It is possible to commute the five years' residence by paying $1.25 an acre at the expiration of 14 months.

Statute of Limitations

In regard to note of $166.50, dated the 7th day of September, 1905, payable 30 days after date and showing payment endorsed upon the back in the sum of $100, under date of March 1, 1910.

The statute of limitations upon a promissory note is four years after date when same is due. This time may be extended by making payment upon such a note, whereupon the four-year period commences to run anew; thus in the present instance the four-year period expired on the 28th day of February, 1914. An acknowledgment in writing of the debt, even after the statute has run, will renew the period of the statute. A note upon which the statute of limitations has run is nevertheless a valid, enforceable obligation, providing the party does not affirmatively plead the statute of limitations.

Damages

An intoxicated man on the wrong side of the road ran into me damaging my motorcycle. Can I get damages from the company if the man was not working for it at the time? What procedure should I take to get damages?—Subscriber.

According to your statement of facts the man with whom you collided was evidently upon an excursion of his own. The employer for whom he worked could not therefore be held, although it is very clear that the man himself could be held for the damages to your motorcycle. A case of this nature you should take to an attorney to draw your complaint and attend to your case for you.

Collecting Query

About two years ago A asked B the price of four sacks of coal. B replied, 70 cents per sack, but if you will take five sacks I'll make it cheaper, $2.80. A gave B check for this amount and received the coal. A few days later B wrote A that he made a mistake and sent a bill for 70 cents. Can A be sued for this amount?

According to your statement of facts it is quite clear that you paid full price demanded by the coal dealer and you would not be liable for the additional amount demanded. In any event the matter is so small that it would hardly be subject to a suit.

Unsigned

This department has received two inquiries, one from Earlimart, another from Madera, which were unsigned, the subscribers apparently not understanding the rule of this paper to pay no attention to communications which do not have names of writers attached. We do not publish names but they must be signed to communications. The Earlimart inquirer would probably be advised by mail, for the inquiry hardly has sufficient general interest to use in the columns of the Cultivator. It is an inquiry, however, which is entirely proper. The Madera inquirer would be dvised that the ceremony might be legal in Nevada but would not hold in California.

LITTLE WILLIE

Little Willie had been very naughty—so much so, in fact, that, after having reproved him several times, his mother was at last forced to severely punish him. When his father arrived home in the evening he at once perceived that Willie's eyes were suspiciously red. "What's the matter, sonny?" he cried. "Oh, nothing," responded Willie uneasily. "Come, don't be frightened," said the father, in coaxing tones. "Tell me all about it; I want to know." Willie remained silent for some time, then he suddenly burst out: "Well, if you must know, I've had a thundering row with your wife." — Pearson's Weekly.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

APPLE DAY.

Everybody eat an apple on next Wednesday, which is National Apple Day. The United States never had a finer nor a better apple crop. Europe hasn't a very good stomach for apples this year so Americans must eat more than ever. They will probably not be higher priced. Eat an apple; eat a box.

TREES TO PLANT.

Nurserymen of California are discussing matters concerning their business at San Diego this week. The nurserymen of this state are a great factor in its development, for the greatest of our industries is the fruit industry and the nurserymen must supply the trees for the orchards which are its foundation. It is wise that the people who follow this calling should meet and discuss methods of production of better stock and of protecting and advancing their interests.

NOVEMBER PHOTOS.

Photos for the November contest should reach this offiice not later than the morning of October 29. Do not wait to mail until that day, for photos would not reach the office in time, though if belated ones come they will be held over for the December contest. The prizes are: $2.00 for first, $1.00 for second best and a six months' extension of subscription for all who send photos which are retained for later use in our columns. The Cultivator already has a fine supply of California home life scenes, but we wish more and hope this month's contest will bring out another half hundred photos to compete for the prizes.

DAIRYMEN AT MODESTO.

Thursday, Friday and Saturday of this week are the days of the annual convention of the dairymen and creamerymen. The convention this year is held at Modesto in Stanislaus County, the county which boasts of being the greatest producer of dairy products in California. It boasts loud and long, partly because the banner has been held from almost the beginning of the state by Humboldt County, but within the past year Stanislaus has passed the farther northern county. Humboldt is still some producer of butterfat and the state is proud of her. We doubt not many delegates will come from Humboldt to the state convention at Modesto and take honors in the butter scoring contest which is a feature of the convention. The dairy industry of California is growing rapidly, and that is wise, because no dairy country ever existed which was not a rich one.

48 ON BALLOT.

The amendments to the constitution initiative and referendum measures, to be voted upon at the polls this year pass a great number of questions up to the people of California to study. Daily and other papers are discussing more or less certain measures, but we have seen no complete list of them given as they will appear on the ballot. In order to give the readers of the Cultivator opportunity to at least get a general idea of their order on the ballot we give in the fewest words possible the following list of the various measures as they will appear.

Of the 48 measures 22 are constitutional amendments proposed by the legislature; four are bonding propositions submitted by the legislature; two are acts of the legislature, or laws which were duly signed, but submitted to referendum; two are bonding propositions submitted by initiative petition; two are amendments to the penal code submitted by initiative; five are general laws submitted by initiative.

Abbreviations are: S. C. A., Senate Constitutional Amendment; A. C. A., Assembly Constitutional Amendment; I. C. A., Initiative Constitutional Amendment; B. P. S. L., Bonding Proposition Submitted by Legislature. The measures are:

1 CALLING CONVENTION FOR REVISION OF CONSTITUTION. Concurrent resolution submitted by legislature.

2 PROHIBITION. Initiative. Prohibits manufacture, sale, gift or transportation of intoxicating liquors.

3 EIGHT HOUR LAW. Initiative. Makes it a misdemeanor to employ any person more than eight hours in one day or more than 48 in one week.

4 ABATEMENT OF NUISANCES. Referendum. Closes questionable lodging houses.

5 INVESTMENT COMPANIES ACT. Referendum. Creates state corporation department having control of corporations. Known as Blue Sky Law.

6 WATER COMMISSION ACT. Referendum. Creates state water commission for control of all waters in state.

7 LOCAL TAXATION EXEMPTION. A. C. A. Empowers any county or municipality to exempt from local taxation any personal property except franchises.

8 EXEMPTING VESSELS FROM TAXATION. S. C. A. Exempts from taxation until Jan. 1, 1935, except for state purposes, all vessels over 50 tons.

9 REGULATING INVESTMENT COMPANIES. Initiative. Authorizes governor to appoint auditor of investments.

10 ABOLITION OF POLL TAX. Initiative.

11 UNIVERSITY OF CALIFORNIA BUILDING BOND ACT. Initiative. Provides bond issue of $1,800,000.

12 CONSTITUTIONAL CONVENTIONS. A. C. A. Provides method of choosing delegates at non-partisan primary election and authorizes legislature to submit for adoption plan of selecting delegates, and that conventions shall meet within nine months after election.

13 QUALIFICATIONS OF VOTERS AT BOND ELECTIONS. Initiative. Provides that no elector may vote on bonded indebtedness unless property owner.

14 VOTING BY ABSENT ELECTORS. Initiative. Provides for issuance of certificate of identification and ballot to absent voter.

15 DEPOSIT OF PUBLIC MONEY. I. C. A.

16 CONDEMNATION FOR PUBLIC PURPOSES. S. C. A.

17 EXPOSITION CONTRIBUTION BY ALAMEDA COUNTY. S. C. A.

18 NON-SALE OF GAME. Referendum. Makes misdemeanor of buying or selling game.

19 CONSOLIDATION OF CITY AND COUNTY, AND LIMITED ANNEXATION OF CONTIGUOUS TERRITORY. I. C. A.

20 PRIZE FIGHTS. Initiative Amendment to Penal Code.

21 CITY AND COUNTY CONSOLIDATION AND ANNEXATION WITH CONSENT OF ANNEXED TERRITORY. I. C. A.

22 LAND TITLE LAW. Initiative Amendment of Act for Certification of Land Titles. Popularly known as Torrens Law. Provides for certificate of title issued by state and insures greater safety and economy in real estate transfers.

23 ELECTIONS BY PLURALITY, PREFERENTIAL VOTE AND PRIMARY. A. C. A.

24 ASSEMBLY PAYROLL EXPENSE. A. C. A. Increases amount allowed for expenses of officers and others of the state assembly.

25 ADOPTION AND AMENDMENT OF MUNICIPAL CHARTER. A. C. A.

26 LEGISLATIVE CONTROL OF IRRIGATION, RECLAMATION AND DRAINAGE DISTRICTS. A. C. A.

27 COUNTY CHARTERS. A. C. A.

28 REGULATION OF PUBLIC UTILITIES. A. C. A. Gives greater powers to railroad commission, especially power over public utilities in municipalities.

29 INCORPORATION OF MUNICIPALITIES. A. C. A.

30 IRRIGATION DISTRICTS CONTROLLING INTERNATIONAL WATER SYSTEMS. A: C. A. Provides that irrigation districts may acquire control of stock in international water systems which have title to part of system situated in foreign country. A. C. A.

31 VALUATION OF CONDEMNED PUBLIC UTILITIES BY RAILROAD COMMISSION. A. C. A.

32 ELECTION OF U. S. SENATOR. A. C. A. Eliminates provisions of present section preventing governor from being elected during term of office and provides that senators shall be elected by people of state.

33 PUBLIC UTILITIES IN MUNICIPALITIES. S. C. A. Authorizes municipal corporations to acquire and operate public utilities.

34 TAXATION OF PUBLIC PROPERTY. A. C. A. Declares taxable all lands not within municipality or county owning them by county within whose boundaries they lie.

35 SACRAMENTO STATE BUILDING BONDS. B. P. S. L. Provides $3,000,000 bonds for state buildings at Sacramento.

36 FOR OR THE AGAINST THE SAN FRANCISCO STATE BUILDING ACT. B. P. S. L. Provides $1,000,000 bonds for state building in San Francisco.

37 FOR OR AGAINST THE STATE FAIR GROUNDS BONDS. B. P. S. L. $750,000 bond for improvement of fair grounds.

38 LOS ANGELES STATE BUILDING BONDS. Initiative. Provides for $1,250,000 for state building and site in Los Angeles.

39 SUSPENSION OF PROHIBITION AMENDMENT. Initiative. Provides that if amendment to constitution, which is number 2 on the ballot, passes that the section relating to manufacture and transportation for delivery outside the state shall be suspended till Jan. 1, 1916.

40 EXTRA SESSIONS OF DISTRICT COURTS OF APPEAL. A. C. A.

41 MISCARRIAGE OF JUSTICE. S. C. A.

42 PLACE OF PAYMENT OF BONDS AND INTEREST. S. C. A. Permits payment of interest at any point in U. S.

43 EXEMPTING EDUCATIONAL INSTITUTIONS FROM TAXATION. S. C. A.

44 MINIMUM WAGE. A. C. A. Authorizes legislature to establish minimum wage for women and minors.

45 ONE DAY OF REST IN SEVEN. Initiative. Prevents work more than six days per week and more than 48 hours in week.

46 DRUGLESS PRACTICE. Initiative. Creates state board of drugless physicians.

47 PROHIBITION ELECTIONS. Initiative. Prohibits state election on question touching upon manufacture and transportation of intoxicating liquors for eight years.

48 FOR OR AGAINST THE SAN FRANCISCO HARBOR IMPROVEMENT ACT OF 1913. B. P. S. L.

Agricultural News Notes

Texas citrus growers expect to ship something over 2000 cars of fruits this year.

Census reports of Germany showed that on June 2, 1914, that country had over 25,000,000 pigs.

Florida's coming citrus crop, for the season 1914-15, is estimated at about 9,000,000 boxes, an increase over last season's shipments of 1,000,000 boxes.

Experiments in alfalfa breeding and value of alfalfa meal in feeding hogs are being carried on at the Colorado agricultural experiment station at Fort Collins.

Officers of the Okanogan national forest in the state of Washington are installing powerful signal lanterns for night use in reporting forest fires from lookout peaks.

In addition to the difficulty of harvesting crops in France by inexperienced hands, mostly women and children, the stormy weather has greatly handicapped the work.

The first shipment of cotton direct from this country to France since the war began was made last week. It went to Havre. About half the cotton exported this season has gone to Japan.

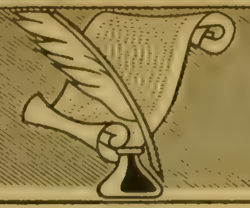
"The cultivation of citrus trees for profit is now an established industry in all the Australian states except Tasmania," says the Fruit World of Australasia. Does that interest California citrus growers?

In connection with the buy-a-bale-of-cotton movement which has been discussed in the newspapers, the Nashville, Chattanooga and St. Louis has announced that it will buy 125 bales of cotton at 10 cents a pound.

"There have been all kinds of predictions as to the grapefruit crop of Cuba and the Isle of Pines, and perhaps no other crop has been over-estimated more than this," writes a buyer who has been visiting those sections. Even some of the growers on the Isle of Pines have been estimating the yield to be between 250,000 and 500,000 boxes. "Now there is every indication that the early estimates can be cut in two."

A federation of egg circles was this spring formed in Kansas with central organization and headquarters at Emporia. Eggs must be gathered at least once a day, twice on very hot or very cold days. They must be kept in a cool, dry place and marketed at least twice a week. Every member agrees to pen up or otherwise dispose of all male birds from June 15 to September 1. Breach of rules is punishable by loss of membership.

Agricultural News Notes of the Pacific Coast



Northern California

Sacramento Valley day at the Panama-Pacific Exposition will be August 7, 1915.

The Davis unit of the Yolo County farm bureau held a big meeting yesterday.

There is some agitation in Shasta County for the appointment of a livestock inspector.

The shipment of fresh figs has been an important item in Auburn's fruit industry this season.

Woodland, Yolo County, is completing arrangements for a harvest festival to be held October 23.

Eldorado County growers of Bartlett pears are most enthusiastic over the outlook in the pear industry.

A fruit box shook factory at Placerville reports shipments to date this season amounting to over 100 carloads.

Olive culture is becoming more important yearly in Shasta County, where there is one orchard of 120 acres.

The Mendocino Farmers' and Apple Growers' Association is making plans for an apple show to be held the 27th of October.

Yolo County expects to plant several thousand acres to rice the coming season, as this year's plantings have been so successful.

At the meeting of the Newark center of the Alameda County farm bureau on September 28 there were 250 people present.

It is claimed that California will harvest 500,000 sacks of rice this year, most of which will come from Butte and Colusa Counties.

Eldorado County has shipped out this year over 300 carloads of fresh fruits, most of which was consigned to the Atlantic seaboard.

Heavy shipments of barley are going from San Francisco to foreign ports. One British steamer left last week with 8,000 tons of barley consigned to Antwerp.

October 30 has been set apart by the farm bureau of Yolo County as Harvest Festival. It is to be held at the county seat and prizes will be offered for exhibits.

Farm Adviser Searles, of Yolo County, reports during the month 57 personal visits to farms in the county. During the same time 80 cows have been added to the County Cow Testing Association.

An organization whose members are composed of poultrymen from all parts of the state was formed at the state fair held in Sacramento. It is to be known as the California State Poultry Association. N. E. Luce of Los Angeles is president and the secretary is C. A. Wilkins, Sacramento.

In a conference held at the university farm recently by members of the university faculty and representatives of the state dairy bureau and the Milk Improvement Association of San Francisco, a state wide movement was launched to secure standard grading of milk for California on a plan similar to that now in effect in the state of New York.

Central California

The Porterville cannery is experimenting in the canning of dried peaches.

Ducor, Tulare County, has already shipped out 125,000 bags of wheat and barley.

Kings County's 16th annual fair was held last week at Hanford and was attended by thousands of visitors.

The board of supervisors of Tulare County has passed an ordinance requiring fumigation of citrus trees.

A cooperative packing house is being planned for Ahwahnee, Madera County, for use of apple growers.

Porterville canneries have started packing olives. About 125 tons is estimated as the yield for this section.

The citrus packing houses of Porterville have decided to employ day labor instead of box labor in handling oranges.

Greenfield, in Monterey County, captured first prize for most artistic table display at the California apple show just closed at San Francisco.

A number of fruit growers of the state met at Sacramento recently and discussed introduction of a standard fruit law before the next legislature.

Forest Supervisor Patterson reports more than 100 fires in the Sequoia national forest this season, most of them brush fires that did little serious injury.

Farm Adviser Mayhew of Madera County will visit Oakhurst October 20, 21; Nipinnawasee, October 22; Coarse Gold, October 24, 26; North Fork, October 27, 28.

The Visalia Poultrymen's Association announces the opening of a cooperative grocery store to sell supplies to members. The association has an active membership of 68.

The annual state convention of Farmers' Unions will be held in San Jose November 10-11. The Santa Clara County convention will be held the 24th of this month, also at San Jose.

Secretary Eberhart of the Fresno County fair announces that the week's attendance was over 55,000, an increase of 13,000 over the attendance at last year's fair. Total gate receipts were $36,000.

The counties convention of the California Development Board will be held in Santa Rosa, October 23-25. The subject to be discussed is "Legislative Measures Now Under Consideration in California."

The California Inland Waterways' Association held a three-days' session at Stockton the last week in September. The principal topic of discussion was conservation of waters for irrigation purposes.

It has been determined not to hold a citrus fair at Fresno this winter. The principal objection to the proposal for holding the fair is that it will, in a sense, detract from the exhibits at the Panama-Pacific.

Fruit workers who have been idle since the closing of the cannery season at Exeter began packing grapes October 10. By the end of the grape season the navel orange packing season will open.

Southern California

The duck and quail seasons open October 15, the dove season closes November 1.

The suggestion has been made that a Southern California fair be held at San Diego.

The Riverside district has shipped to date 4200 cars of citrus fruit for the season.

Ranchers of Escondido in San Diego County are manifesting much interest in Sudan grass for feed.

The Indian fiestas are passing since the order came from Washington that no gambling will be allowed.

The celery crop of Orange County is in fine condition. The total acreage at the present time is about 800.

The slight rain which fell the first of the month has been of considerable benefit to cover crops in citrus groves.

Celery shipments to the East from Southern California will probably start the first of December. Orange County expects to ship over 500 carloads.

A new citrus organization in the La Habra Valley is about to begin the erection of a packing house. Practically all the members are growing lemons.

Winthrop Howland, raiser of Swiss milch goats at Redlands, captured a number of prizes at the state fair. There is talk of establishing a goat cheese factory at Redlands.

From San Diego comes the report that Japanese interests have arranged to buy all the Imperial Valley cotton crop, to bring it by motor truck to San Diego and ship it from that port.

Arroyo Grande has become one of the largest globe artichoke growing sections of the state. The output amounts to several thousand dollars a month during the harvesting season.

The green chile crop of Garden Grove in Orange County, it is estimated, will this season be worth $300,000. The same section is now planting pimientos on a commercial scale.

Low prices prevailing in Los Angeles for butterfat are believed by some creamery operators to be due to the new 90 per cent score recently adopted. San Francisco demands a higher standard.

Operators of sugar beet factories have been informed that the conference between sugar manufacturers and the department of commerce has resulted in the decision to secure beet seed directly from Rotterdam.

The shipping house of the La Habra Walnut Growers' Association is now in operation. The president of the association reports the crop smaller than was estimated early in the season, but of finer quality than was anticipated.

Sugar beet growers and factory men of Southern California and the San Joaquin Valley met last week in Los Angeles and took preliminary steps for permanent organization of an association the purpose of which is largely educational, the study of beet culture in all its aspects, particularly the problems presented by diseases and pests.

The Coast

The Utah agricultural college is recommending growers to plant English walnuts.

Stock raisers in Cochise County, Arizona, report cattle in better condition than for years.

Two million dollars' worth of cattle have been contracted in northern Arizona for delivery this fall.

Apple growers of Wenatchee, Washington, are carrying on a strenuous fight against Washington's proposed eight-hour law.

The Portland hop market, it is reported, is forcing down prices to growers. Some sales have been made as low as 14 cents.

The Arizona agricultural experiment station at Tucson is issuing circulars telling farmers how to prevent smut on wheat, barley and oats.

The United States department of agriculture estimates this year's apple crop of the state of Washington at 7,200,000 bushels, as against 6,900,000 in 1913.

Threshing in the grain fields of Montana will not be finished until the end of the month. Growers are generally holding, with expectation of getting better prices.

The state forestry department of Arizona is conducting demonstrations in preservative treatment of fence posts at the various fairs now being held throughout the state.

Orchardists and commission men of eastern Washington are getting together in an effort to halt the price cutting which has been a ruinous feature of the early fall market.

Willcox, Arizona, is making big plans for its fair, to be held the last three days in the month. There will be exhibits of agricultural products, also household and educational exhibits.

Farmers of the Salt River Valley of Arizona have decided that they want a farm adviser. A general committee has been appointed to organize farm bureau work in the different sections of the valley.

The next annual meeting of the Arizona Cattle Growers' Association is scheduled for Douglas some time in January. At the same time and place cattle men of Cochise County will hold their annual meeting.

Fruit growers of the Spokane Valley in Washington estimate damage to the fruit crop from the recent wind and rain storm at between $10,000 and $25,000. One grower states that 1,000 boxes of apples were blown off his trees.

A Seattle representative of the apple growers is urging them not to rush their fruit on the market, but place it in cold storage and then scatter to the smaller communities throughout the United States, instead of piling all the shipments into the big centers.

The Arizona experiment station has turned over to the reclamation service 175 head of grade Tunis sheep, to be used in cleaning Johnson grass from the government canals and laterals. It is claimed that 90 days' feeding on Johnson grass will place sheep in excellent condition for market.

DE LAVAL
Cream Separators
Make Fall and Winter Dairying More Profitable

THERE are special advantages in using a good cream separator during the fall and winter months.

The milk from cows long in lactation is hardest to cream,—and likewise hardest to separate with an inferior separator.

Moreover, cream and butter prices are highest, so that the waste of gravity setting or a poor separator counts for most.

Then there's the sweet, warm skim-milk for stock feeding, alone worth the cost of a separator in cold weather.

There is surely no reason to delay the purchase of a separator or to continue the use of an inferior one.

You cannot afford to wait until next spring. Let the De Laval start saving cream for you right now and it will earn its cost by spring.

See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

De Laval Dairy Supply Co.

Feeding Roots: More and Better Milk—Beef Mutton

ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters
for both hand and power, prepare roots in the bes possible way. Cut so fine as to prevent all choking of animals. It's done with the "Non-Choke Curve Cut." Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.
O. E. Thompson & Sons, Ypsilanti, Mich.
BAKER & HAMILTON, San Francisco, Calif.

3 MACHINES IN 1
A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. Sold direct to you on one year's trial. Prices, $22.00 and up.

THESE WHEELS ARE THE SECRET OF OUR SUCCESS.

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.
WESTERN LAND ROLLER CO.
Box 441 Hastings, Nebr.

BLACK LEG LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen, because they protect where other vaccines fail. Write for booklet and testimonials.
10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Cutter's Blackleg Pill Injector 1.50
Discounts: 250 doses, 10 p. ct.; 500 doses, 20 p. ct.
Use any injector, but Cutter's simplest and strongest.
Every package dated, unused pills exchangeable for fresh after date on package. Do not use old vaccine (ours or any other), as it affords less protection than fresh.
Insist on Cutter's. If unobtainable, order direct. Send check or M. O., we pay charges and ship promptly.
THE CUTTER LABORATORY, Berkeley, California.

CURING MEAT ON THE FARM

The best way to eat meat is to eat it while fresh, for there is no way of preserving it that will retain all the nutrition and all the flavor. It is, nevertheless, frequently desirable to cure meat at home, and there is no reason why this can not be done satisfactorily and economically. Salt, sugar or molasses, baking soda, and a little saltpeter are the only ingredients necessary.

Ordinarily the curing of meat should be begun from 24 to 36 hours after the animal is slaughtered. This allows sufficient time for the animal heat to leave the meat entirely, but not sufficient to permit decay to set in. Once the meat is tainted, no amount of preservatives will bring back its proper flavor. On the other hand, if salt is applied too soon, obnoxious gases will be retained and the meat will possess an offensive odor. It is also impossible to obtain good results when the meat is frozen.

Three useful recipes for popular forms of cured meat are given below. The only equipment necessary for them are the ingredients already mentioned and a clean hardwood barrel, or a large stone jar or crock. In considering these recipes it is well to remember that, on the whole, brine-cured meats are best for farm use. They are less trouble to prepare and the brine affords better protection against insects and vermin. A cool, moist cellar is the best place for brine curing. The cellar should be dark and tight enough to exclude flies and vermin.

Corned Beef.

The pieces commonly used for corning are the plate, rump, cross ribs, and brisket, or, in other words, the cheaper cuts of meat. The loin, ribs, and other fancy cuts are more often used fresh, and since there is more or less waste of nutrients in corning, this is well. The pieces for corning should be cut into convenient-sized joints, say five or six inches square. It should be the aim to cut them all about the same thickness so that they will make an even layer in the barrel.

Meat from fat animals makes choicer corned beef than that from poor animals. When the meat is thoroughly cooled it should be corned as soon as possible, as any decay in the meat is likely to spoil the brine during the corning process. Under no circumstances should the meat be brined while it is frozen. Weigh out the meat and allow eight pounds of salt to each 100 pounds; sprinkle a layer of salt one-quarter of an inch in depth over the bottom of the barrel; pack in as closely as possible the cuts of meat, making a layer five or six inches in thickness; then put on a layer of salt, following that with another layer of meat; repeat until the meat and salt have all been packed in the barrel, care being used to reserve salt enough for a good layer over the top. After the package has stood over night add, for every 100 pounds of meat, four pounds of sugar, two ounces of baking soda, and four ounces of saltpeter dissolved in a gallon of tepid water. Three gallons of water should be sufficient to cover this quantity. In case more or less than 100 pounds of meat is to be corned, make the brine in the proportion given. A loose board cover, weighted down with a heavy stone or piece of iron, should be put on the meat to keep all of it under the brine. In case any should project, rust would start and the brine would spoil in a short time.

It is not necessary to boil the brine except in warm weather. If the meat has been corned during the winter and must be kept into the summer season, it would be well to watch the brine closely during the spring, as it is more likely to spoil at that time than at any other season. If the brine appears to be ropy or does not drip freely from the finger when immersed and lifted, it should be turned off and new brine added, after carefully washing the meat. The sugar or molasses in the brine has a tendency to ferment, and, unless the brine is kept in a cool place, there is sometimes trouble from this source. The meat should be kept in the brine 28 to 40 days to secure thorough corning.

Dried Beef

The round is commonly used for dried beef, the inside of the thigh being considered the choicest piece, as it is slightly more tender than the outside of the round. The round should be cut lengthwise of the grain of the meat in preparing for dried beef, so that the muscle fibers may be cut crosswise when the dried beef is sliced for table use. A tight jar or cask is necessary for curing. The process is as follows: To each 100 pounds of meat weigh out five pounds of salt, three pounds of granulated sugar and two ounces of saltpeter; mix thoroughly together. Rub the meat on all surfaces with a third of the mixture and pack it in the jar as tightly as possible. Allow it to remain three days, when it should be removed and rubbed again with another third of the mixture. In repacking put at the bottom the pieces that were on top the first time. Let stand for three days, when they should be removed and rubbed with the remaining third of the mixture and allowed to stand for three days more. The meat is then ready to be removed from the pickle. The liquid forming in the jars should not be removed, but the meat should be repacked in the liquid each time. After being removed from the pickle the meat should be smoked and hung in a dry attic or near the kitchen fire, where the water will evaporate from it. It may be used at any time after smoking, although the longer it hangs in the dry atmosphere the drier it will get. The drier the climate, in general, the more easily meats can be dried. In arid regions good dried meat can be made by exposing it fresh to the air, with protection from flies.

Plain Salt Pork

Rub each piece of meat with fine common salt and pack closely in a barrel. Let stand over night. The next day weigh out 10 pounds of salt and two ounces of saltpeter to each 100 pounds of meat and dissolve in four gallons of boiling water. Pour this brine over the meat when cold, cover and weight down to keep it under the brine. Meat will pack best if cut into pieces about six inches square. The pork should be kept in the brine till used.

Sugar-Cured Hams and Bacon

When the meat is cooled, rub each piece with salt and allow it to drain over night. Then pack it in a barrel with the hams and shoulders in the bottom, using the strips of bacon to fill in between or to put on top. Weigh out for each 100 pounds of meat eight pounds of salt, two pounds of brown sugar and two ounces of saltpeter. Dissolve all in four gallons of water, and cover the meat with the brine. For summer use it will be safest to boil the brine before using. In that case it should be thoroughly cooled before it is used. For winter curing it is not necessary to boil the brine. Bacon strips should remain in this brine four to six weeks; hams six to eight weeks. This is a standard recipe and has given the best of satisfaction. Hams and bacon cured in the spring will keep right through the summer after they are smoked. The meat will be sweet and palatable if it is properly smoked, and the flavor will be good.

BIG SALE PAVILION FOR CORCORAN

The Holstein-Friesian breeders of the San Joaquin Valley are contemplating the erection of a large sale pavilion in the near future either in the town of Corcoran or on the Geo. A. Smith fine stock farm two miles south of town.

The pavilion is to be round with a seating capacity of over 1000. The sale ring is to be in the center, with an entrance on one side, above which will be the auctioneer's stand. Opposite will be the exit. The seats will be arranged in theater style so that no view of the stock will be obstructed. Around the entire pavilion will be box stalls for the viewing, care and preparation of the stock, and so arranged that they can be quickly and conveniently handled at time of sale and also conveniently seen by prospective purchasers before the sale. The pavilion, its entire equipment and its every appointment will be especially designed and adapted to the holding of auction sales of live stock, including cattle, horses and hogs, especially registered Holsteins. A movement is on foot now to make Corcoran the Holstein center of the Pacific Coast.

WOOL GROWERS CONVENTION

The National Wool Growers' Association will meet in its 51st annual convention at Salt Lake City, Utah, November 12-14.

Among the topics for discussion will be national legislation, the wild animal question, better marketing of lambs, feeding sheep on the range, producing and marketing wool, the land question, national forests, railroad rates and service, running sheep in range pastures, better types of range sheep, diseases of sheep, etc. Several of these topics are of pressing importance to wool growers, and, if our flock masters are to solve them correctly, the fullest discussions must be indulged in.

It seems to me that a new era is opening before our sheep breeders, the benefits of which can only be grasped by united and concerted action. In order that the problems confronting us may be correctly solved, I most earnestly urge every wool grower and those engaged in allied branches of the industry to meet with us in Salt Lake City, Utah, November 12, 13 and 14, 1914.—F. J. Hagenbarth, President, National Wool Growers' Association.

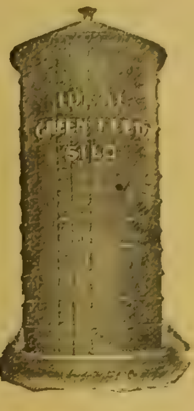
WHERE THERE'S A WILL THERE'S A WAY

The farmers of Arroyo Grande, in San Luis Obispo County, possessors of one of the richest valleys of the state, have not been fully satisfied with their condition. The market for their products has been the problem. Easy matter to raise the fruits, vegetables, etc., but not so easy to find markets at satisfactory prices. The Farmers' Union has now taken hold of the matter. Having the will, they have found a way. They have incorporated and opened a general produce commission house in Los Angeles. C. A. Cheadle, a successful poultry raiser and a stockholder, is manager, working on a salary. The idea is, a square deal for everyone. Poultry and eggs are their specialty, but all kinds of produce, fruit, beans, hay, etc., are handled. Sales are made promptly if market is at all satisfactory, at the highest going prices, and returns are promptly made. The unsatisfactory methods attributed to some commission firms are conspicuous by their absence. It is somewhat on the cooperative plan, the necessary funds having been supplied by members of the Farmers' Union and the profits, if any, accruing to them. The idea is not so much to make money as to furnish a satisfactory marketing headquarters.

Men who come to breeding farms expect to see something above the ordinary. It will not satisfy them to be told that all your cattle need to make them look as fine and large as those of Mr. So-and-So is more feed and the same care he gives his stock.

Here is something of a new argument for sheep, coming from the Canadian Northwest: Of the 300 known Saskatchewan farm weeds, the sheep will eat and make splendid mutton of 260, while stock and horses will merely take 60 or 70 of them.

Make Hay While the Sun Is Not Shining



by putting your last crop of alfalfa in an Ideal Green Feed Silo.

You Need Not Wait on the Weatherman

if you have an IDEAL GREEN FEED SILO, in which to put this last cutting of alfalfa. It will make better feed as silage, than when cured in the usual way. A great many Pacific Coast farmers have tried out this plan and are enthusiastic over it. QUALITY should be the first consideration in the purchase of a silo, and can be expressed by the words

"Permanence"
"Airproofness"

The exclusion of air is necessary to the production and preservation of silage. Both permanence and airproofness are assured in the IDEAL GREEN FEED SILO by the quality of the material used (California Redwood selected Tank Stock), and the many patented features of mechanical construction as used exclusively by ourselves in its manufacture. The Ideal will save its first cost every year used and will last a lifetime.

If interested, write for testimonial letters and descriptive Circular A.

"Full milk pails all thru the dry season, while neighbor's cows are dry."

—that's what O. H. Holmes, Clatskanie, Oregon, writes as his experience in feeding Larrowe's Dried Beet Pulp.

It is the one best feed for dairy cows, both as a milk producer and conditioner. Fine also for horses, hogs, poultry and other live stock. Larrowe's Dried Beet Pulp can be had either plain or with molasses. Some prefer the molasses dried on account of its sweetness, but stock will eat either with great relish.

ONE TO 5 LBS. MORE MILK PER COW A DAY

Larrowe's Dried Beet Pulp is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage with as great or greater succulence—swelling to fully six times its original bulk when moistened. It will not only increase the quantity and quality of milk, but keep the herd in better health with less bag trouble and greater contentment. Try it now. Go to your feed dealer today and buy one sack. Test it on one cow whose milk record you know, and watch results.

Write for booklet, "PROFITABLE FEEDING" — giving valuable information on feeds and feeding; also instructions for using dried beet pulp. Your name and address on a postal will bring you a copy free.

PRODUCTION OF CLEAN MILK

Persons engaged in the production of milk and consumers interested in procuring clean, safe milk, will be interested in the factors for producing the same as outlined by the United States department of agriculture in a recent farmer's bulletin, No. 602, entitled "Production of Clean Milk." The essential factors are outlined as follows: Clean, healthy cows kept in clean, light, well ventilated stables; stable so constructed as to be easily cleansed; a clean, well-drained barnyard; clean utensils, thoroughly sterilized; clean, healthy milkers that milk with dry hands; a small-top milking pail; immediate cooling of the milk to 50 degrees Fahrenheit or lower; storage of milk at a low temperature until delivered; a separate house for handling the milk; an abundant supply of pure water.

How Milk Becomes Diseased

Bacteria, according to the bulletin, find their way into the milk from various sources. Some may come from the udder itself where they grow in the milk cisterns and ducts. The greater number, however, come from the dust of the air, the dirt from the udder and flanks, from the milker, and from unclean utensils. Disease-producing bacteria may get into the milk from cows having such diseases as tuberculosis, or from people who handle the milk, who may themselves have contagious diseases or who have been taking care of patients afflicted with such diseases as typhoid fever, diphtheria, and septic sore throat.

The consumer is sometimes responsible for the contamination of the milk. Milk bottles should not be taken into a sick room, because infectious diseases can be spread by carrying infected bottles back to the dairy farm. If bottles are left where there are contagious diseases they should not be collected by the milkman until they have been properly disinfected by the board of health. In the case of typhoid fever or other serious diseases which may be carried in the milk, it is better for the consumer to put out a covered dish for the milk or have it delivered to some member of the household. Until official permission has been granted, no milk bottles should be removed from a home in which there is or has recently been a case of communicable disease. The consumer should not use milk bottles for holding vinegar, kerosene or liquids other than milk.

Why Clean Milk Is Important

The consumer is interested in clean milk primarily because no one cares to use a food which is not produced and handled under sanitary conditions. There is a more direct interest, however, because of the danger of contracting disease which may be communicated by this means. Serious epidemics of typhoid fever, septic sore throat and other diseases have been disseminated through the milk supply. The weight of scientific evidence at the present time leads to the conclusion that tuberculosis may be transmitted from animals to human beings, particularly children, who consume raw milk containing tubercle bacilli.

Cleanliness is the greatest factor in preventing contamination. From the health standpoint there is great danger not only from the specific disease-producing bacteria previously mentioned, but from milk that contains large numbers of miscellaneous bacteria which may cause serious digestive troubles, especially in infants and invalids whose diet consists chiefly of milk. There is also the minor consideration of the loss to the consumer from milk souring or otherwise spoiling before it can be used. The cleaner the milk, the longer it will keep good and sweet.

Clean milk not only benefits the consumer, but the milk producer who will consider this subject from an unbiased standpoint will find many ways in which he himself is benefited by producing clean milk. There are a number of items in this connection which, when considered alone, may seem unimportant, yet collectively they are of great importance. Moreover, they are not only of immediate value, but have a cumulative value reaching far into the future. Tuberculin testing, for example, is not only a safeguard to the purity of the milk supply for the consumer, but is a means of assisting the producer to protect his herd against future ravages of tuberculosis.

Most producers of market milk have experienced the chagrin of having a shipment of milk refused or returned because it reached the market sour, tainted, or otherwise in poor condition. Although such milk may be used for feeding pigs, it usually means a complete loss to the producer, as it costs too much to transport it back to the farm, and because, depending on the market as an outlet for his milk, he has no means for utilizing small amounts at uncertain intervals. Another important consideration is the unpleasant effect upon the purchaser. Delivering sour or tainted milk usually results in losing the confidence of the dealer; or if it is delivered direct to the consumer, it means the loss of good customers. A reputation for clean milk means fewer complaints, a better class of patrons, and a steady market for the product of the dairy.

BEAUTY, PERFORMANCE, LONGEVITY

The head of Mr. Huston's dairy herd in the Imperial Valley. Mr. Huston says regarding this fine young fellow recently introduced from the east and placed at the head of his herd that he comes with blood which combines beauty, performance and longevity.

The bull, which is two years old, is Kathies Eminent, and his sire is Imp. Lily's Fairy Boy, dam, Eminent Kathie, sired by Eminent Stockwell, 50 per cent Stockwell and 25 per cent Eminent. Eminent Stockwell won nine first prizes and was never beaten in the show ring. The dam of Kathies Eminent gave 2 lb. 2 oz. butter fat in one day as a two-year-old; her dam 2 lbs. 8 oz. as a sixteen-year-old.

Purebred Registered
HOLSTEIN CATTLE

Twenty-five cows and one bull, all purebred registered Holsteins, were recently unloaded at Williams, Minn. They were purchased by the Security State Bank of that place, and sold to farmers on easy terms. These far-sighted financiers selected purebred registered Holstein cattle because they were sure that it was for the best financial interest of the community. They acted on their knowledge of Holsteins as producers as compared with other breeds. If purebreds were good for them, why not for you?

Poultry for Profit

THE MOIST MASH

Written for California Cultivator by
Jean A. Koethen

The pendulum never swings so far in any given direction but that it will in time swing just as far in the opposite direction. This is just as true of feeding poultry as it is of real estate booms, and with just as good reason. We poor human beings seem to be constantly carried too far by our enthusiasms, and so we have to come back.

When I was a little girl I never heard of anyone feeding anything but a wet mash. It was usually corn meal mixed with cold water and made the chief item in the baby chick's bill of fare. If the chick died we were sorry, but we never blamed the feed. As for the hens, they were lucky to get corn. Why bother them with a mash?

When I came back, after many years, to raising chickens, every one was talking about the dry mash. There must have been a gradual development of the moist mash before this, from the simple corn meal and water of my childhood to a balanced mixture of ground grains mixed with cooked vegetables and table scraps or cooked meat. Mr. Felch speaks of it in his book, written in 1885, and gives some very elaborate formulas, a new one for every day in the week, for the breakfast mash. Evidently when the wet mash became too elaborate the pendulum had to start somewhere, so it swung slowly toward the less laborious dry mash.

It must have been about the time Mr. Felch's book was written, perhaps earlier, that the Little Compton poultry colony in Rhode Island came into existence. This colony has been one of the most successful examples of a community specializing in market eggs, and is still in existence, if I am not mistaken. The Little Compton egg farmers followed the simplest of methods. The hens were housed in colony houses which were scattered over many acres of pasture land, entirely without fences, and foraged for a good part of their living. In the morning the egg farmer made a trip among his houses with his "dough cart," carrying a wet mash of cooked vegetables and ground grain, and at night he went around again with their evening meal of grain. For the rest the birds "hustled," and being Rhode Island Reds, they hustled to some purpose.

The moist mash proved, after years of trial, to be rather laborious, and like all methods of feeding, it was easily abused. Left in the troughs in the sun, it soured and produced various ailments when it was eaten. Carelessly mixed, so that it was sloppy or gummy, it was found to cause bowel trouble. As the number of fowls kept on a single plant grew larger and larger, it was found almost impossible to mix a wet mash for so many, and so presently the dry mash, fed in hoppers, came into vogue, and poultrymen and writers were loud in their condemnation of the wet mash. Hardly a good word was said for the wet mash anywhere for several years.

But the moist mash had too many good qualities to permit of its being abandoned forever, and of late a sentiment has arisen in its favor again. We are beginning to learn, maybe, that no method is wholly bad or wholly good, and that the same rule cannot be applied to all circumstances and conditions of fowls. Just recently Tom Barron, the great English breeder of White Leghorns, has said in an interview that he uses the moist mash exclusively, so we may now expect it to become fashionable again.

The advantages of the moist mash over the dry, as I see them, are the following:

It permits of greater variety in the feeding. Many things may be incorporated in the wet mash which can hardly be fed in any other way. Potatoes, for instance, are a valuable food if used in moderation. Turnips, carrots, beans, peas and other vegetables which fowls will not eat raw can be cooked and mashed and mixed with ground grain in the moist mash. Scraps of fresh meat, "pluck" and fish refuse can be cooked and fed in the same way, and stale bread, which is a very valuable feed and often to be had cheap, may be made palatable in this way. In fact, there is nothing that is used on the family table which cannot, if it is to be had at a reasonable price, be used.

It is economical, because it permits of using table scraps, potato parings and waste vegetables.

It can be fed warm, and this on a cold morning is a distinct advantage, especially when it is well seasoned with pepper, mustard and salt. Chickens like something warm in the morning as well as we do, and while it is considered better for some reasons to feed the warm mash at night, many poultrymen find it hard to get away from the feeling that fowls get more good out of a warm mash in the morning than later in the day. My reason tells me it is wise to feed the mash at night, so the hens can go to roost with that well-filled feeling which is so comfortable, but sentiment leads me to feed it in the morning, because the hens are so eager for it.

The hens like it better, when properly prepared, than they do a dry mash, and this is a very good reason indeed. The tastes of the fowls must be consulted if we are to get the best work out of them, and they do like a rich, well-seasoned warm mash.

There are several ways of preparing a moist mash, and each one, those who use it will tell you, is the best ever. My way is to put all table scraps and vegetable refuse in a kettle after dinner at night—potato peelings, tomato peelings, apple parings (if there are not too many), cold mush from breakfast, bits of stale bread, anything that is left over from the day, and cook it well. When it is nearly done I add a couple of handfuls of corn meal and a little salt and pepper. After this is taken from the stove I thicken it with bran and middlings—it really doesn't matter just how much of each—till it is dry and crumbly, and add a handful or two of beefscrap if there is no meat in the mash mixture. Sometimes I use the dry mash I feed in hoppers, just as it is, but if the cooked mixture is quite rich I think bran and middlings or bran alone will answer.

After my mash has cooled till it is right to eat I cut up lettuce, or sometimes an onion or two, or if I have no lettuce, a little green alfalfa. This is what the hens like particularly, and they all make a grab for the green. When it is gone they come down to the real mash.

Another way of making this mash, when green feed is scarce, is to add alfalfa meal before any ground grain is put in and just let it steep a little. Alfalfa meal does not take the place of green feed, but it is a little better than nothing.

I always feed the dry mash in hoppers, whether I give a moist mash or not, and I am careful not to feed more of the moist mash than the hens will clean up in a few minutes. It is just an appetizer, as you might say, and not enough to make them lazy, which is the objection most often made to warm mash in the morning. If I had sour milk or buttermilk I should always feed a moist mash, and always mix it with the milk, except for just enough water to cook the vegetables. There is no better food for poultry of

(Continued on Page 383)

QUESTIONS AND ANSWERS

(Continued from Page 369)

through the stem) and with a hooked peg pegging it into the ground about one-half inch below the surface. Then to a light stake tie the point of the shoot in an upright position, which will open the cut or slit, care being taken not to sever entirely the point of the shoot from the main stem. Next cover the cut part with light sandy soil and give a good watering. Keep the soil moderately moist, and in a few weeks the layers will be rooted, when they may be severed from the parent stem and planted where they are to bloom."

We take it the layering could be readily done at this time of the year, and perhaps it is not too late to start the cuttings. Roses are easily started from hardwood cuttings, say six, eight or ten inches long, these to be made when the bush is as nearly dormant as possible, imbedded from two-thirds of the length of the cutting in sandy soil and irrigated the same as any garden crop. The nurseryman uses shorter herbaceous cuttings and roots in sand with under heat in the glass house, but often fine results are had from ordinary garden propagation. To keep carnations from excessive blooming best results are secured by pinching, also as soon as the flower begins to fade be sure it is cut.

Permanganate of Potash

How much permanganate of potash to a gallon of drinking water is necessary to cure roup in fowls?—Subscriber, East Bakersfield.

Permanganate of potash in the drinking water will not cure roup. It is a mild antiseptic, and if fresh and strong may perhaps kill disease germs in the water, but to be effective in roup it must be brought into contact with the diseased tissues of the head and eyes. The treatment is as follows: Prepare a solution of premanganate of potash, about a tablespoon of the permanganate to a quart of water, in a cup or pail of such size that the fowl's head may easily be immersed in it. Press the nostrils together between thumb and forefinger in the direction of the beak two or three times, and press also between nostrils and eyes in an upward direction. This is to loosen the discharge in nostrils and eyes. Then plunge the bird's head into the permanganate of potash solution and hold it there for 20 to 30 seconds. Repeat this treatment twice a day till all symptoms have disappeared. The birds which are being treated should be kept in a dry, sunny, well-ventilated coop and fed plenty of nourishing food.—J. A. K.

Transplanting Blackberries

Can I transplant two-year-old Mammoth blackberry roots and roses at this time of the year without danger of their dying?—Subscriber, East Bakersfield.

It depends on the condition of the plants. If they have been deprived of water long enough to be almost entirely dormant at this time it is possible they might be moved without danger. However, we would prefer to defer the moving for two or three months. At that time they should be entirely dormant, and if reset with an abundance of water to settle the dirt about them they should start with the first warm days, and every plant should give something of a crop next year, though not as much as if left in the present location.

Grape Cuttings

What is the best month to start grape cuttings?—Subscriber, East Bakersfield.

The best month to start grape cuttings is when the vine is entirely dormant. The usual method is to gather the brush at pruning time and work into cuttings 10 or 12 inches long, burying them two-thirds of their length in sandy loam soil, and handling the same as any other nursery stock as to irrigation and cultivation.

Preserving Flowers

Is there any way of sending orange blossoms east so they will retain their form and fragrance? Attempts which I have made so far have proved fail-

(Continued on Page 383)

The Household Department

HALLOWEEN COMES BUT ONCE A YEAR.

Written for California Cultivator by Mrs. J. W. Coolidge, Porterville.

Prize Article.

When the boys and girls of a certain village school appeared one morning in late October, there was a pleasant excitement in the air. Many nods, smiles and "Did you get one?" 's passed among them. Even the teacher seemed interested, for she, too, smiled and nodded when asked the question.

It appeared that quite late the previous evening door bells were rung in many homes. When the doors were opened no person stood there, but small packages lay on the steps. Upon investigation these proved to be walnuts wrapped in yellow tisue paper and tied with red ribbon. Within the nuts were small slips of paper bearing mysterious inscriptions which, when puzzled out, were found simply to be written backward. They ran as follows:

"Halloween comes but once a year
Out at our house you will find good cheer.
Unless the ghosts shall have fastened the gate
Be sure to come at half past eight
—Helen Lane."

Helen herself had nothing to say but "Come and see."

Her home was situated on the extreme edge of the village, and was a large commodious farm house set in pleasant grounds with many trees. When the guests began to arrive that night the whole place was in total darkness, but as they approached the gates leading to the grounds a faint glimmer of light proved to be pumpkin lanterns on each pillar. Just as they reached the gate a tall ghostly figure appeared in the gateway and "Follow the rope" was heard in deep awe-inspiring tones. A few of the more timid ones were inclined to stay outside but were encouraged to take hold of the rope, and keeping their hands on it followed where it led. This was through the grounds from tree to tree, behind bushes, through fences (which they had to climb), and finally to the back door of the house. The kitchen was very dimly lighted with one pumpkin lantern, and another ghost without speaking pointed to the stairs. Upon reaching the second floor the same scene was enacted and they went on to the third floor.

This was a great old-fashioned attic decorated with autumn leaves and lighted by many pumpkin lanterns. There was a tent in one corner with a real witch in it who told the fortunes of all who dared approach. All of the old-fashioned games were played, bobbing for apples, and so on.

One game which caused much merriment deserves description. The boys and girls were lined up facing each other and about six feet apart. They were each given one end of a cord six feet long with a raisin tied in the middle, and directed to put the end in their mouths and chew towards the raisin, the one reaching it first getting the prize.

When games were exhausted refreshments appeared. They consisted of dainty sandwiches, doughnuts, individual pumpkin pies and cider, and were served from tin plates and cups, paper napkins with Halloween decorations being used. Refreshments over, the sounds of a stirring march were heard from below stairs and a grand march was started for the first floor. The boys and girls passed out two by two, and as they reached the stairway each was handed a tiny lighted candle with a shining red apple for a candlestick; tied to the candles were little slips of paper with rhymed lines written on them telling the fortune of the bearer. When they were all downstairs the music changed, and soon to a merry tune they were dancing the Virginia reel which ended the evening's entertainment, and, the ghosts having disappeared, they went home voting this the merriest Halloween.

For older guests it adds greatly to the mystery and fun to invent as many obstacles as possible to the progress through the grounds and it is really thrilling when deep groans are heard in the darkest places.

The ghosts were draped in sheets with tall peaked caps made from stiff white cambric muslin. These were drawn over the head, concealing it entirely, holes being left for the eyes and mouth.

Recipes.

Doughnuts—Three eggs, one cup sweet milk, one even cup sugar, four tablespoons melted butter, about one quart flour sifted with three rounding teaspoons baking powder. Roll as soft as possible and roll all out before frying any. They are even better if left to stand a short time before frying. Then drop into deep hot fat with the upper side down. Fry only a few at a time, drain and roll in granulated sugar and cinnamon mixed. Must be eaten to be appreciated.

Individual Pumpkin Pies—Use any good pastry formula. Cut in rounds with scalloped cooky cutter and press down into muffin tins, thus making little pastry shells. Fill with following mixture and bake nice brown:

Filling—Beat four eggs thoroughly. Add one pint finely mashed pumpkin (I use canned and like it), and beat again, adding about one-half cup sugar, or sweeten to taste; one tablespoon ginger, one tablespoon cinnamon, also little nutmeg. Finally add one pint rich milk or, better still, one pint cream. Beat all well together, fill shells and bake.

OUR HOUSEHOLD

The household contests have brought in some splendid and very helpful material. We want to make this department an exchange for helpful ideas. The contests merely suggest some definite line to bring out communications from our friends, but we want to hear from you on any subject which you find of great interest as a housewife or which you would like to have discussed. If you have a problem, send it in. We will put it before our other Cultivator readers. We can help each other.

Next week some questions received recently will be answered on this page.

November Contest

Many excellent suggestions have been sent in by subscribers for the subject of the November prize contest; all will probably be used later, but the one which seems most timely is that of Mrs. J. W. Coolidge of Porterville. She writes: "By all means let us have for the November contest articles on 'A Safe and Sane Christmas,' one which would eliminate the dreadful strain of the week before."

That is a subject, surely, which is close to all our hearts. We don't want to eliminate Christmas; few of us would eliminate Christmas giving, but would we not all joyfully eliminate the "dreadful strain of the week (or month) before" and the flat feeling of the week after? If we put in more love and thought and substracted social obligation, would that go a long way toward solving the problem?

In reading an exchange recently this sentence caught our fancy:

"When we shall have schooled ourselves to saying to the unexpected guest. 'Roast turkey and cranberry sauce have I none, but sausage and apple pie give I unto thee,' we shall have reached the acme of hospitality."

Is not that also the thought which should actuate Christmas? The giving, not the gift, is the essential without which Christmas is not made ours.

Are you on your way to solve the Christmas problem, or are you sitting back thinking that perhaps this year you will start? Give us your ideas.

Two Dollars

For the best article two dollars in cash will be given; for the next, one dollar; for all that are published, six

ZENO

The Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

For Sale by
Producers' Supply Co., Los Angeles; Rialto Protective Association, Rialto; Kessler Brothers, El Cajon; Harry Highfield, La Mesa.

Costs You Nothing

to try this wonderful new Aladdin kerosene (coal oil) mantle lamp 10 days right in your own home. You don't need to send us a cent in advance, and if you are not perfectly satisfied, you may return it at our expense.

Twice the Light on Half the Oil

Recent tests by noted scientists at 14 leading Universities, prove the **Aladdin gives more than twice the light** and **burns less than half as much oil** as the best round wick open flame lamps on the market. Thus the Aladdin will pay for itself many times over in oil saved, to say nothing of the increased quantity and quality of pure white light it produces. A style for every need.

Over Three Million

people now enjoy the light of the Aladdin and every mail brings hundreds of enthusiastic letters from satisfied users endorsing it as the most wonderful light they have ever seen. Such comments as "You have solved the problem of rural home lighting"; "I could not think of parting with my Aladdin"; "The grandest thing on earth"; "You could not buy it back at any price"; "Beats any light I have ever seen"; "A blessing to any household"; "It is the acme of perfection"; "Better than I ever dreamed possible"; "Makes my light look like a tallow dip"; etc., etc., pour into our office every day. **Good Housekeeping Institute,** New York, tested and approved the Aladdin.

We Will Give $1000

to the person who shows us an oil lamp equal to the Aladdin (details of this Reward Offer given in our circular which will be sent you). Would we dare invite such comparison with all other lights if there were any doubt about the superiority of the Aladdin?

Get One FREE

We want one user in each locality to advertise and recommend the Aladdin. To that person we have a special introductory offer under which one lamp is **given free.** Just drop us a postal and we will send you full particulars about our great **10 Day Free Trial Offer,** and tell you how you can **get one free.**

months' subscription to the Cultivator. If your subscription has already been extended in credit for articles, recipes or photos submitted in the household contests, you are eligible as a contestant for cash prizes, but cannot secure further extension of subscription.

Send Articles Early

All articles for contest should be addressed to California Cultivator, Los Angeles, and should be in this office by Thursday, November 12, which is just one week before they will appear in the paper in the issue of November 19.

Many Halloween articles and walnut recipes for this contest came in too late to enter. Several communications dated October 5 were not received until October 12. Perhaps they traveled too long in somebody's pocket. Better give them to Uncle Sam at once. Please write on one side of your paper.

Among suggestions for future contests some excellent ones are: The School Lunch, Planning Meals Ahead, How to Keep the Boys and Girls on the Farm. What do you think of them? What is your suggestion? Write us when you send in your Christmas article or photo for the contest of November 5.

Photo Contest

The next photo contest will close Thursday, October 29. Be sure to get your photo of farm life in early.

Two dollars will be paid for the first prize-winner, one dollar for the second, and then for all photos which are accepted and retained a six months' subscription to the California Cultivator will be given. We will only keep photos from which we can make clean-cut engravings. This means that everyone who sends a photograph which will answer for an engraving will receive a prize, except that only one extension of subscription will be made in credit for photo retained.

FAVORITE WAYS OF USING WALNUTS.

Prize Recipe.

Nut Loaf.

Chop together one and one-half cups nuts, one stalk celery, two tablespoons parsley, one small onion. Add one cup cooked rice, two cups bread crumbs, one tablespoon olive oil or butter, one tablespoon flour, add one and one-half cups hot milk, and two eggs (yolks and whites beaten separately), salt and pepper to taste. Bake three-quarters of an hour. Serve hot with Hollandaise or tomato sauce.

Tomato Sauce—1 tablespoon butter, 1 tablespoon flour. Put over the fire until well blended. Add 1 cup strained tomato. Cook until it thickens. Salt to taste; add a pinch of cayenne if liked.—Mrs. C. G. Warren, Riverside.

Walnut Loaf.

Two cups milk, ⅔ cup flour, ½ teaspoon salt, 2 cups bread or cracker crumbs, 1½ cups chopped walnuts, 2 beaten eggs, ½ teaspoon grated onion. Stir the flour smooth with part of the milk. Heat the rest of the milk to boiling, and stir into it the flour mixture. Cook until thick. Add to this the remaining ingredients, put into an oiled bread pan and bake one-half hour. Serve with gravy or plain.—Mrs. R. G. Lantz, Salida.

Nut Sausage.

One and one-half cups cooked rice, 1 cup ground nuts, ½ teaspoon ground sage, 1 teaspoon (scant) salt. Mix well, form in small cakes and fry as you would meat sausage.—Mrs. L. C. Buhl, Pomona.

Nut Salad.

One cup of well-flavored apples cut in small cubes, one cup celery chopped fine, one cup walnuts chopped. This is the well known Waldorf salad, but when used with the following cream dressing is especially delicious and always much appreciated by the masculine members of the family:

Cream Salad Dressing—Two eggs, one cup cream, 2 tablespoons sugar, 2 tablespoons butter, ½ cup good vinegar, not too sour. Beat the eggs thoroughly, then beat in the cream. Put in double boiler over boiling water, add sugar and butter, and while stirring constantly pour in the vinegar very slowly. Take off the instant it becomes creamy and season to taste with salt and a liberal dash of paprika. This is very good with any fruit salad. —Mrs. J. W. Coolidge, Porterville.

Toasted Walnuts.

You need not wait until you have some ingredient which you are out of to try this. Put walnut meats, as whole as possible, on a large pie plate and set in moderately hot oven. Stir occasionally to keep from burning; leave about 15 minutes, and you have a crisp, slightly browned nut with a delicious flavor. Sprinkle with salt and put away in fruit jars until used. They remain crisp and are always ready to serve.—Mrs. G. H. P., Los Angeles.

Baked Apples With Walnuts.

Remove cores of apples and sprinkle in sugar, add just a little water so they will not burn, and bake until soft. When cold sprinkle fine chopped nut meats over the top.—P. S. R.

Grapes With Nuts.

Six pounds Muscat grapes, four pounds white sugar, two pounds walnut meats. Seed grapes, cook with sugar until thick. Add nuts (first run through the grinder), and seal in glasses. You will wonder why you did not have it before.—Mrs. Charles R. Austin, San Fernando.

Delicious Walnut Conserve.

Peel ripe figs and mash the pulp. To each pound of pulp add one pound of sugar and cook to a thick jam. This is a slow process and should be done over a slow fire, and the jam must be constantly watched and stirred, for the slightest scorching will spoil the flavor. Prepare English walnuts by shelling, and chopping up the meats to a medium fineness. Do not put them through a meat chopper as that will make them too fine and oily. A cupful of chopped meats to two quarts of cooked jam will make a good proportion, but one can have as many nuts to the jam as liked. When the jam is cooked add the nuts and stir them thoroughly in the hot jam, but do not cook them. After stirring in the nuts fill jam glasess with the conserve, and when cold, cover with paraffine and set away in a cool place. This is one of the most delicious conserves imaginable, and when served with whipped cream can not be equalled for delicacy.—Georgina S. Townsend, Azusa.

Carrot Pudding.

Mix 1 cup grated carrots (raw), 1 cup grated potatoes (raw), 1 cup brown sugar, 1½ cups flour, 1 cup raisins, 1 cup currants, 1 cup chopped suet, 1 teaspoon soda, 1 teaspoon cinnamon, ¼ teaspoon cloves, one cup walnut meats. Steam 3 hours. Serve with hard sauce.—Rebecca Strutton, San Diego.

Tomato Mince Meat With Nuts.

One peck green tomatoes cut or chopped fine, five pounds granulated sugar, one and one-half pounds raisins, one tablespoon each of cinnamon and cloves, one tablespoon salt, or more if desired; one cup good vinegar. Cook until thick, then add two or three cups of chopped walnuts. This can be canned and will keep a long time. It is a fine substitute for mince meat, and is much cheaper.—G. M. H., Long Beach.

Nutty Pumpkin Pies.

Prepare the usual pumpkin filling for your pies, but before putting into the crust add a cup of walnut meats. When the pie is baked sprinkle the top with fine nut meats. This makes a very pleasing variation from the ordinary pie.—H. W. Shepard, National City.

Walnut Raisin Pie.

When making raisin pie use a few walnut meats and see what a delicious raisin pie results. Delicious mince meat pies are obtained by using less meat and substituting walnuts, and many prefer them to those made with meat alone.—Mrs. P. Gilli, Bakersfield.

Walnut Bread.

Two cups whole wheat flour, 1 cup white flour, ⅓ cup sugar, 1 teaspoon

Spraying Time

and there is no better spray than

Scalefoe

Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years giving the greatest satisfaction without injury, but positive benefit, to the plant. Write for circular with testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

West Coast Seed House

TOMPKINS & CO., Proprietors
116-118 E. 7th St. LOS ANGELES

salt, ½ teaspoon each of cinnamon and cloves; ¼ teaspoon ginger, 1 teaspoon baking powder, ½ teaspoon soda, 2 tablespoons shortening, 2 tablespoons molasses, 1½ cups milk, 1 cup each of seedless raisins and broken walnut meats. Bake about 40 minutes. Do not cut till cold. Spices and raisins can be left out if desired and it is very good.—Mrs. J. F. Crawford, Hemet.

Nut Bread.

Four cups whole wheat flour, 4 teaspoons baking powder, 1 cup chopped walnuts, 1 teaspoon salt, ½ cup sugar, 1 egg, 2 cups milk. Let rise 20 minutes before baking. Bake one hour.—Mrs. S. G. Unland, Aanaheim.

Walnut Bread.

One egg, ½ cup sugar, 1 cup milk, 3 cups flour, 3 teaspoons baking powder, 1 cup chopped walnuts, pinch of salt.—Mrs. A. M. Larson, Kingsburg.

German Nut Loaf.

One cup chopped walnuts, 1 cup chopped seeded raisins. 4 cups flour, ½ cup sugar, 2 cups milk, 1 egg. 1 teaspoon salt, 4 teaspoons baking powder. Sift together flour, salt, sugar and baking powder, add nuts and raisins, well beaten egg; then the milk. Mix well, put in greased pans, and let stand 20 minutes. Bake in moderate oven 55 minutes. Cut thin and buttered it makes excellent sandwiches for the children's lunch box.—Mrs. G. A. Brunson, Artesia.

Walnut Molasses Loaf.

One and one-half cups coarsely chopped walnut meats, 2 cups Graham flour, 1½ cups white flour, 1 cup New Orleans molasses, 1 cup white sugar, 2 cups sweet milk, 1 egg, 1 large teaspoon soda, 1 small teaspoon salt. Place beaten egg, molasses, sugar and milk in mixing bowl. Mix together Graham flour, white flour, walnut meats, soda and salt. Now mix these with ingredients already in bowl and beat well for five minutes. Turn into well-greased loaf pan and bake in slow oven about one hour. This makes a pan eight by twelve inches level full. —Mrs. Burle Jones, Maxwell.

Walnut Bread.

Four cups of flour, 4 teaspoons baking powder, ½ cup of sugar, small teaspoon salt, 1 egg, 1 cup walnuts, (chopped or ground), 1½ cups sweet milk. After mixing, put in pan and let stand 30 minutes. Place in a moderate oven and bake 45 minutes.—Mrs. J. R. Beck, El Monte.

Walnut Spice Cake.

One and one-half cups sugar, 1½ cups butter, 2 eggs, 1 cup sour milk or buttermilk, ½ cup sweet milk, 1 teaspoon baking soda, 2 cups flour, 1 teaspoon cloves, 2 teaspoons cinnamon, ¼ teaspoon nutmeg, 1 large cup chopped walnuts, ½ cup seeded raisins. Bake as a loaf cake and cover with white frosting.—Mrs. N. C. Johnson, Chatsworth.

Nut Cake.

Three eggs, 1½ cups granulated sugar, 1 cup sour cream, 1 cup raisins, 1 cup English walnut meats, 2½ cups flour, 1 teaspoon soda, ½ teaspoon each cinnamon, cloves and nutmeg. Separate the yolks and whites of the eggs. Beat yolks until creamy with sugar and cream. Add spices. Sift together flour and soda. Dust fruit with some flour, add to the mixture and beat thoroughly. Lastly, fold in gently the stiffly beaten whites of the eggs. Bake in a dripping pan, ice when cold and place half of a walnut meat in the center of each square, when cut in square pieces.—Mrs. Alice Munro, Klink.

Fruit Cake.

One cup butter, 1½ cups sugar, 3 eggs, 1 cup sour milk or quite thick buttermilk, 1 teaspoon soda, 1 cup raisins, 1 cup English walnuts, 2½ cups flour, 1 teaspoon of cinnamon and nutmeg, ½ teaspoon cloves, flavor with a little lemon extract. Cream the butter and sugar, then put in yolks which have been beaten, then raisins and coarsely ground walnuts. Add sour milk (put soda in cup first then fill up with the milk), stir and add to above mixture, now add flour and spices, and lastly the whites of the eggs beaten to a stiff froth. This makes three large layers.—Emilie Dettweiler, Alta Loma.

Potato Cake.

One cup of butter, 2 cups of sugar, 1 cup of walnuts, 1 cup of potatoes, 1 cup of chocolate, 1 cup of sweet milk, 2 cups of flour, 1 teaspoon of baking powder, 1 teaspoon each of cloves and cinnamon, 4 eggs, beaten separately. This makes a splendid loaf cake.—Cora Smith, Tulare.

Potato Cake.

Cream 2 cups sugar with 1 cup butter. Into 1 cup of hot mashed potatoes stir ½ cup shaved bitter chocolate, 1 cup walnut meats, cut fine; 1 teaspoon allspice, 1 teaspoon cinnamon, ½ teaspoon cloves. Beat 4 eggs separately, add whites to creamed butter and sugar, yolks to other mixture, 2 cups flour, 2 teaspoons baking powder, 1 cup milk, combine mixtures, adding flour and milk alternately. Flavor with 1 teaspoon vanilla. Beat thoroughly and bake in a loaf 45 minutes. Frost and put nice halves of walnuts on top.—Mrs. J. F. Browning, Highland.

Nut Filling for Cake.

One cup white sugar, 1 cup sour cream, 1 cup chopped English walnuts. Bring ingredients to the boiling point, and leave over a slow fire to simmer until it thickens. Remove from fire and add 1 teaspoon of vanilla, beat until creamy and spread on cake.—Mrs. C. E. Peterson, Bard.

Mocha Walnut Filling.

Cream two cups of powdered sugar and two tablespoons butter. Incorporate 1 cup of walnut meats, chopped fine, and moisten with cold coffee until convenient consistency to spread quickly. This filling cuts without crumbling or breaking.—Mrs. T. P. Harrell, Los Angeles.

Russian Rocks

Three cups flour, 1 pound walnuts (1 pint kernels), 1 cup seeded raisins. Mix together. One and a half cups sugar, 1 teaspoon cinnamon, 1 teaspoon nutmeg, ½ teaspoon cloves, a pinch salt, 1 cup melted butter, 3 eggs well beaten, 3 teaspoons strong vinegar, 1 teaspoon soda disolved in a little hot water. Mix as given. Drop from spoon in baking pans, bake in moderate oven.—Martha Walsh, Bostonia.

Ozark Rocks

One cup butter, 1½ cups light brown sugar, 1 cup coarsely chopped English walnuts, 1 cup raisins, 1 cup sour milk, 3 eggs, 3 cups flour, 1 teaspoon each of cloves, cinnamon and soda. Beat eggs, sugar and butter together, add milk with soda stirred into it, then spices, nuts and floured raisins, ading the flour at intervals. Have pans greased. Drop mixture from a teaspoon into pans, some distance apart, Bake like cookies.—Mrs. H. P. Dralle, Sanger.

Nut Drops

Beat yolks of two eggs until thick, add gradually while beating one cup brown sugar pressed hard into cup, 1 cup chopped walnuts, the stiffly beaten whites of two eggs, 6 heaping tablespoons of flour and one scant teaspoon of baking powder. Drop on buttered tin and bake in a moderate over.—Myrtle E. Fishback, Woodland.

Walnut Jumbles

Three-quarters of a cup of chopped nut meats, ½ cup of butter, 1 cup sugar, 1 egg, pinch of salt, 1 teaspoon of baking powder, 2 cups of flour, ⅓ cup of milk. Cream the butter and sugar together, add the egg well beaten, the milk, salt, flour, baking powder and nuts. Mix well and drop in spoonfuls on buttered tins. Bake in a quick oven. One-half cup chopped raisins may be added.—Mrs. F. A. Rollins, Chino.

Walnut Cookies

Half cup lard, ½ cup butter and 2 cups white sugar. Cream together. Beat 2 eggs and add ten tablespoons

The Kitchen
Where We Live From

In well-equipped kitchens where the choicest foods are prepared, you will always find Ghirardelli's Ground Chocolate. The kitchen takes on a new delight when Ghirardelli's Ground Chocolate enters it, for then you may look for many new and delightful things to eat. It is easily and quickly made and is extremely economical. Is it in your kitchen? See that it is.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

D. GHIRARDELLI CO.

HAY

Under date of October 10 Scott,

WEATHER CONDITIONS

For week ending Oct. 10, 1914.

Report from the various stations of the U. S. Weather Bureau, by Geo. H. Wilson, director, San Francisco:

	Rainfall Data			Temperature Data	
	Past Week.	Seasonal to Date.	Normal to Date.	Maximum.	Minimum.
Eureka	.82	2.56	2.16	68	44
Red Bluff	.52	.52	1.24	80	52
Sacramento	.08	.08	.63	82	50
San Francisco	.01	.03	.55	74	52
San Jose	.00	.00	.59	80	42
Fresno	.00	.20	.53	82	48
Independence	.00	.20	.49	74	40
San Luis Obispo	.00	T	.69	76	44
Los Angeles	.00	.19	.18	76	56
San Diego	.00	.68	.18	72	56

T means trace.

Magner & Miller say:

Receipts of hay for the past week, 4151 tons, about the same as for the preceding two or three weeks.

Although the trade has expected to see a decrease in the receipts before this time, they still continue to be very heavy. It is to be expected that receipts will decrease very shortly.

Most of the arrivals continue to be of the poorer and medium grades. The few cars of choice that have arrived have moved without trouble. Some hay has moved for export during the week, although this demand has not been heavy. Arrivals of alfalfa from the river districts are quite heavy but have been cared for fairly well. Straw is without change.

We quote the average wholesale prices on carload lots on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	8.00@9.00
No. 2 Wheat or Wheat and Oat	6.00@7.50
Choice Tame Oat	10.00@11.00
Other Tame Oat	6.00@9.00
Barley	5.00@7.50

Citrus Fruit Market

LOS ANGELES, October 14, 1914.

The orange year is closing with a most satisfactory situation. There are no exceptionally long prices being paid for Valencias, but the excellence of the fruit is forcing the market to recognize it and fairly good returns are received for all shipments of good fruit. A period of five weeks shows an advance on good Valencias in the neighborhood of 40 cents. There are yet about 1200 cars to go, and while they will not all be cleaned up before November 1, which is the beginning of the new year, there is a market in sight for all which will be shipped. Before they are all gone the new crop from central California will begin going forward. Tulare reports ripening rather in advance of usual, possibly as much as two weeks, and by the 10th of November new fruit will be loaded.

Fancy lemons are commanding a strong advance over second grades in the New York markets. In addition another difference of perhaps a dollar is made in favor of desirable sizes, that is, 300's will command perhaps a dollar more than 360's. California lemon growers who desire greater returns must recognize this prejudice and grow more 300's and more fancy grades.

Shipments.

Shipments of oranges to date since November 1, 1913: 37,957 cars; lemons, 2,816; total, 40,773. To same date last season, oranges: 13,381 cars; lemons, 2,170; total, 15,551. Total all citrus fruits two years ago this date, 35,246.

ST. LOUIS, Oct. 12.—Cool, raining. Market steady. Two cars Valencias sold.

Pears, barrel, 1.00@4.00; baskets, one bushel, 40@1.25; per 100 pounds, 60@90. Persimmons, cases, 12 pints, 30@65. Quinces, barrel, 2.00@4.00. Plums, cases, 4 baskets, 65@1.00.

QUESTIONS AND ANSWERS

(Continued from Page 378)

ures. I often read of weddings in the east where the bride wore orange blossoms, and would like to know how they are obtained.—Subscriber, San Dimas.

The form and general appearance can be retained by dipping the flowers in melted paraffine, just warm enough to maintain its fluid condition. Use freshly cut flowers, free from moisture, moving about in the melted paraffine for an instant so as to get rid of all air bubbles. Of course this will not preserve the fragrance, but we think it is the only way to prepare flowers to ship long distances. We also give another formula, although we cannot vouch for its success. Five hundred parts ether, 20 parts transparent copal and 20 parts sand. The flowers are immersed in the varnish about two minutes, then allowed to dry off ten minutes, repeating this five or six times.

Maintaining Pests

Is there any law requiring one to clean up Johnson grass or similar pests and what procedure is necessary?—Subscriber, Tulare County.

There is a state law which gives entire control of this question into the hands of the county horticultural commissioner. In this particular case the inquirer can refer the matter to County Horticultural Commissioner Charles F. Collins at Visalia, and we doubt not his power will enable him to bring it under control.

Watermelons for Horses.

How much feed value have watermelons for horses or hogs? Are they a desirable feed?—Subscriber, Sacramento.

The feed value of melons is exceedingly low. We do not find, however, an analysis which gives the exact value, but it is somewhat lower than pumpkins and pumpkins contain only about one per cent crude protein and practically no fat formers or, to be more exact, .2 of one per cent. The principal value of such a feed lies in its succulency, conditioning and giving horses an appetite for dryer feeds of greater value. Of course, care should be exercised not to feed too heavily because an oversupply of such feed is liable to cause undue activity of the kidneys.

Fertilizer.

I would like to be informed as to best fertilizer for soil in this portion of Los Angeles County. It is a sandy loam. Peach trees are not looking as well as they should and fail to make thrifty growth. Is commercial fertilizer of more value than barnyard manure?—Subscriber, Lankershim.

The question of fertilizing is a long one. On general principles would say that stable manure, if it can be had at a reasonable price, is to be preferred. It has desirable physical action as well as chemical content, which, however, is not as complete a fertilizer as the tree needs, but it can be supplemented with phosphates and potash. The rich loam soils of the Lankershim section should not require very heavy fertilizing if it is receiving thorough cultivation. It is possible the peach trees referred to are affected by some disease like root knot, little leaf, curl leaf or one of the numberless troubles to which the peach is heir. The best answer to such a question can only be given after a visit to the orchard by a qualified tree doctor.

Fleas on Dog.

What is the best remedy for fleas on dog?—Subscriber.

The best remedy for fleas on a dog is one of the many makes of tar soap sold by any druggist. Bathe the dog in a tub of water, using the soap to make a lather, rubbing well into the skin and hair, and wash out with lukewarm water thoroughly. This method will also give the coat of hair a bright and glossy appearance and when properly done will destroy all vermin, as well as their eggs, which often are embedded under the skin.—R. V. M.

WALNUT RECEIPTS

(Continued from Page 381)

of sweet milk, add 3½ cups of dry rolled oats, 1 cup chopped raisins and 1 cup chopped walnuts. Sift together 3 cups flour, ½ teaspoon salt and 1 level teaspoon each of cinnamon, cloves and soda. Add dry ingredients to the wet mixture and beat well. Drop from a teaspoon upon a greased pan, leaving room for spreading and bake in a moderate oven. These cookies are delicious and will keep for weeks if put in an air-tight box and locked up.—Mrs. Willis Grove, Inglewood.

Walnut Chocolate Caramels

One cup molasses, 1 tablespoon butter, 2 teacups brown sugar, 3 tablespoons flour. Mix sugar and flour thoroughly before adding molasses. After boiling about 15 minutes stir in ½ cup of chocolate wet with ½ cup sweet milk (cream if convenient). Boil the mixture until it will harden in water. Remove from fire and add one cup broken walnut meats and 1 teaspoon vanilla. Pour quickly into buttered tins; when nearly cold mark off in squares.—Mrs. F. O. R., Kerman.

Karo Nougat

Two cups granulated sugar, 1 cup Karo corn syrup, ½ cup water, white of 1 egg, 1 cup walnut meats broken up. Cook the sugar, corn syrup and water till it forms a ball in water. Have the egg white beaten stiff and beat the candy slowly into it. Then add the nuts and beat till it becomes spongy when tried with the tip of finger.—A. G., San Dimas.

Candied Walnuts

Three cups sugar, 1 cup water; boil until it hardens when dropped in water. Then flavor with lemon. It must not boil after the lemon is put in. Put a nut on the end of a hat pin, dip, take out and turn until cool. If the candy gets cold set on the stove for a few minutes. Grapes and oranges quartered may be done in same way.—Mrs. O. O. Carpenter, Earlimart.

Divinity Fudge

Boil together 4 cups granulated sugar, 1 cup Karo corn syrup and 1 cup water until a little of it hardens when dropped in cold water. Have ready whites of 4 eggs stiffly beaten. Pour the above boiled mixture over the beaten eggs, stirring quickly. Have ready 3 cups of finely chopped English walnuts. Pour these in and beat till it begins to get hard. Do not stir too long as it will turn to sugar. Pour in buttered pans and when cool mark off in squares.—M. W.

Walnut Creams

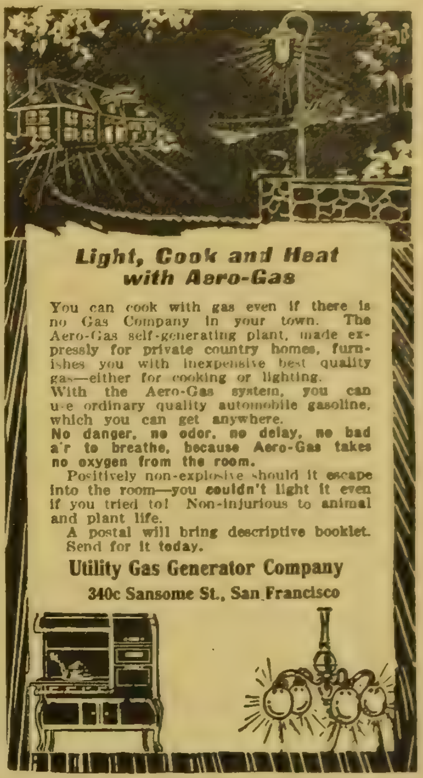
Crack walnuts, preserving halves. Make stiff cream of milk and pulverized sugar. Drop cream on one-half of walnut and place other half on top. Chocolate may be mixed in the creams when variety is desired. These are easily made candies for your bon bon box.—Mrs. W. E. Osgood, Ontario.

THE MOIST MASH

(Continued from Page 377)

all ages than sour milk. Sweet milk is good, too, but it is not a good plan to feed sour milk one day and sweet the next. Always feed it the same way; then the fowls' digestive organs will not have to be continually adapting themselves to the change in diet.

If a wet mash is valuable for laying hens, it is even more valuable for growing stock. It is sometimes objected that a moist mash affects the bowels of the chicks, but I have never found it so, and I have sometimes commenced feeding it as early as the tenth day. The Cornell mash for chicks is mixed always with sour milk, if it is used as they use it at Cornell, and there is nothing better. A very good mash for young chicks is composed of equal parts of bran, corn meal, middlings and rolled oats, with about 5 per cent beefscrap and 5 per cent ground bone added. It is better mixed with sour milk, but very good mixed with water. After a month the rolled oats can be dropped. It is always a good plan to cut a little lettuce or an onion into the chick mash. The chicks like it and it is good for them.



Light, Cook and Heat with Aero-Gas

You can cook with gas even if there is no Gas Company in your town. The Aero-Gas self-generating plant, made expressly for private country homes, furnishes you with inexpensive best quality gas—either for cooking or lighting.

With the Aero-Gas system, you can use ordinary quality automobile gasoline, which you can get anywhere.

No danger, no odor, no delay, no bad air to breathe, because Aero-Gas takes no oxygen from the room.

Positively non-explosive should it escape into the room—you couldn't light it even if you tried to! Non-injurious to animal and plant life.

A postal will bring descriptive booklet. Send for it today.

Labranza Ranch - Merced, California

The above analysis is on every sack of Surelay. "What's on the sack is in the sack, and that's what's in the egg." When you feed Surelay, the balanced egg food, to your chickens you give them the very elements that the egg is made of.

Surelay makes hens healthy. And a healthy hen is usually a laying hen---if the feed is right.

To obtain a perfectly balanced egg feed takes time, knowledge and scientific effort. More than that---it will cost you more than if you bought it ready-mixed.

SURELAY
Balanced Egg Food

is a by-product of the great Sperry Mills and in its manufacture the same rigid rules of cleanliness and sanitation are observed as in the making of the famous Sperry products for human consumption.

Ask about the Surelay Coupon in Every Sack

The more Surelay you buy, the cheaper you get it. There is a coupon in every bag, which entitles you to an additional quantity. This practically enables you to get a material rebate on every sack you buy.

Ask for the Booklet, "Makes Hens Happy."

We will send it to you free. It contains valuable facts about the raising of chickens.

Fill out the coupon and send for it today. Address all communications to the Stock and Food Department.

You Need an International Motor Truck

You need horses, and must have them, for field work, but on the road and at covering ground—on trips that come up continually—they are wasters of time and money. That is why farmers are buying International Motor Trucks to do their light hauling rapidly, all the year round. International trucks cost a low price to buy and less than horses and wagons to keep.

Their solid tires cut down tire troubles, and the wheels are high enough to insure good traction. The motor is simple and has plenty of power for emergencies. The brakes are safe on any hill. The ignition system is of the best. One lever controls the car. Springs are strong and resilient. The International is built to save you money.

Let us show you all that an International Motor Truck will do for you. Drop a card today for catalogues and full information to the

HAVE You Received *Your* Copy of "Progressive Cultivation"?

AMONG the hundreds of coupons we receive every month requesting copies of "Progressive Cultivation" there are always a few the senders of which have neglected to fill in the lines provided for the name and address.

We do not want any man to feel that we have neglected his request. In cases where name and address are lacking, however, we can do absolutely nothing.

Have you written for "Progressive Cultivation" and not received a copy? If so you probably mailed the coupon in a hurry and forgot to fill it out. Will you please send the one at the bottom of this announcement, giving your name and address in full. The book will reach you promptly.

If you have never asked for a copy of "Progressive Cultivation" it is high time you did. From cover to cover it is filled with money saving, time saving information. It tells how and when to use dynamite for sub-soiling, tree planting, irrigation work, rock and stump blasting, drainage work, excavating, felling trees, and many other purposes.

Thousands of farmers are now using Hercules Dynamite and with its aid doing more work and getting better results. If you are not among them please fill out the coupon below *fully* and mail it to us. Your copy of "Progressive Cultivation" will be sent you at once.

What Mr. Hospers of Los Angeles saw *in* Milford Valley

The following letter was written by a practical farmer, Mr. P. Hospers of 3015 Budlong avenue, Los Angeles, who has just returned from a thorough investigation of Milford Valley lands. Mr. Hospers was kind enough to permit us to use this letter which was written to a friend (F. P. Gallagher) of Armour, S. D. This is a practical man's opinion of a practical farm land offering. If you are in the market for the best fruit, potato, grain and alfalfa land in the west—read this letter carefully.

Los Angeles, Cal., Sept. 28, 1914.

F. P. Gallagher,
Armour, S. D.

Dear Friend:

I want to tell you about my trip to Milford Valley, Utah, last week. I found one of the finest valleys I have ever seen, nothing like it in South Dakota, Montana, Colorado or Texas, and you know I've been all over those places, having bought and sold land there.

These Milford lands have an extra fine soil and plenty of the best water, mighty cheap, too, for this western country. It is a fine fruit, grain and stock country. Saw wheat that threshed 55 bushels to the acre; saw oats 100 bushels to the acre weighing 55 pounds to the bushel. Saw alfalfa fields that cut 3 tons to the acre and they cut it three times, so you see they got some hay, and it is of the best quality. Saw fields of potatoes that will go 500 bushels to the acre. I saw some of the finest hogs and cattle and I know that is what you like. Climate is just right, nothing like it in the middle west. A man can work outside every day here. Milford is a live town of 1500 people and has a pay roll of $50,000 a month. These lands are from two to six miles from the center of town. The railroad is the main line of the Salt Lake. You asked me several times to let you know when I found a good place. I am sure this is just what you want. You had better come at once and see. I expect to move to Milford in the spring. This land is selling very fast and I would advise you to act quick. The cost is only $30 per acre and the water right is sold at $70 per share, sold on 12 years' time, if desired. This is the cheapest land of this class I've seen out here. With best wishes, I am

Yours truly,
P. HOSPERS, 3015 Budlong Ave.

California Cultivator
Rural Californian combined with California Cultivator
Vol. XLIII No. 17 LOS ANGELES: THURSDAY, OCTOBER 22, 1914 One Dollar Yearly

Planting and Culture of Almonds

Address by Geo. W. Pierce Before State Fruit Growers Convention at Davis

OLD as is the almond, it is grown on a commercial scale today only on the shores of the Mediterranean Sea and in California. Some attempts have been made to produce almonds in Arizona and Mexico, but the output in these and numerous other sections is consumed by the local demand.

The annual average output of almonds from California for the last 15 years is about 2000 tons. It has run from 450 tons in 1898 to 3300 tons in 1910. The crop of 1913, owing to drouth and frost, was but 1150 tons. During 1913 the per capita consumption of almonds in the United States amounted to but one pound for each five people.

There are two great varieties of almonds, viz., those having sweet meats and those having bitter meats. The bitter almond is not grown commercially in extensive quantities outside of the Mediterranean regions. These almonds are chiefly used in the manufacture of prussic acid, bitter almond oil and in perfumery. In California the bitter almond output is chiefly consumed by the nurseryman. It is claimed that nursery stock on bitter almond root is of superior quality.

The almond of commerce, having sweet meats, is divided into hard shelled, soft shelled and paper shelled varieties. These are again subdivided many times to meet the requirements of the trade and to gratify the fancy of supposed originators of varieties. Many of these are well known and standard; others have names known only locally. As a business proposition for the average grower it is best to produce standard varieties having an established market demand.

The almond is supposed to have found its way into California from Europe about 1853. It came to us after long centuries of existence with many of the imperfections that characterized its early career. To a Californian, Mr. A. T. Hatch of Suisun, is given the credit of first having undertaken the improvement of the almond along scientific lines. So marked were the results obtained by Mr. Hatch that the leading commercial varieties of almonds grown in California today are designated as the Hatch varieties. Chief among these are the Nonpareil, the I. X. L. and the Ne Plus Ultra. The first two are the leading and highest priced almonds produced in California at this time.

While Mr. Hatch greatly improved the quality of the almond, the varieties originated by him when planted in the orchard in solid blocks of a single variety rarely give a satisfactory yield. The quality of the product was improved at the expense of the output. To obtain cross-pollination and increased yield it has been found good practice to alternate the Hatch varieties with some hardier almond. Years ago hard-shelled almonds were used for this purpose, but now the Texas Prolific, Drake's Seedling, or other soft shelled varieties are generally used because of their higher market value. Usually two rows of the soft-shelled varieties alternate with four rows of the Hatch varieties. Planting in this manner is advised to facilitate gathering, which will later be explained. The rows should run, so far as may be, at right angles to prevailing winds at the time of blooming, i e., if the prevailing winds are from either the north or the south, run the rows by varieties east and west. This matter should be given the closest attention.

Varieties.

No general rule can be given for the distribution of the several varieties of almonds that will apply to all sections. Experience is the only safe guide as to what varieties should be planted in any given locality. For instance the I. X. L., an extremely shy bearer in many localities, excels all other varieties in certain localities where conditions of soil and climate meet its requirements. When you plant you plant for profit. Before deciding what to plant, find out what varieties have done best in your immediate vicinity, or experiment in a small way until you know what to plant. Neglect to follow this rule has caused great loss to individual almond growers in California and has been responsible for much demoralization in the industry. Apply business methods to the business you are to engage in.

A tree following nature's laws makes the best of existing conditions. Make the needs of the trees your study. Protect them from invasion of all kinds. These trees are your partners as well as your property. You have a right to demand of them full compliance with every term of the existing partnership. They in return are entitled to a full and complete performance of every detail of the contract on your part. It is your duty to make possible the greatest development on the part of the tree. If you have planted wisely and given proper care the trees will do the rest. Unless each member does his part the partnership will be a failure and the business unprofitable.

Locations Favorable to Culture.

The almond, because of its extremely early blooming period, is the most susceptible to frost of any orchard tree of general cultivation. It is best adapted to a light sandy soil, or a grade of land not far removed from a sandy loam. Heavy rains at the blooming period, especially if the weather be cold, are disastrous to the almond. The tree is a most profuse bloomer, but, previous to pollination, at the blooming period, requires mild weather to insure best results. After pollination has taken place, but while the bloom is still on the tree, heavy rains frequently occur without serious damage to the crop.

No soil, not well drained, will produce almonds successfully. Numerous instances are a matter of record where almond trees have been planted on soil apparently adapted to the tree, yet where the water plane during the winter months, stood within four to six feet of the surface, and the trees have died.

Almonds will not do well in a section where there are frequent and heavy fogs. As a rule they will no produce well when planted on low grounds, as they will be more subjected there to the frost than at a slightly elevated location.

From the foregoing it is evident that the productive area of almond culture is limited. Look well to the

(Continued on Page 390)

State Dairy Convention at Modesto

Dr. Leroy Anderson Represents the Cultivator and Writes of Discussions Touching Upon Cooperation and General Dairy Management. He Also Describes Many of the Exhibits

QUITE in contrast to dairy meetings of a decade ago were the gatherings at Modesto the last three days of last week. Thursday was Creamery Operators' day, with a morning attendance of 100, an afternoon attendance of 200 and an evening attendance almost equal to that of the afternoon. In the beginning of the Creamery Operators' Association, we were accustomed to having a score present where now there are a hundred. Friday was the Dairy Association day, or Dairyman's day—the producers' talkfest, as contrasted to the manufacturers' talkfest of the previous day. The numbers equaled those of Thursday, and the interest was even more keen, for Modesto is the greatest dairy cow center in California, and whether the discussion was on manufacture or production, the dairyman of Stanislaus County was the most prominent personage in the hall.

Modesto made excellent preparations for the event and entertained her guests royally. A new auditorium served as the place of meeting, and was large enough to hold several exhibts as well as seats for 400 or more people. Of hotel accommodation the city has all that can be desired, and all visitors were comfortably "slept and eaten." The cooperation between association officers, local dairy interests and the chamber of commerce was complete and cordial.

Quality.

The keynote of creamery discussion was quality of creamery products, especially butter. The concensus of opinion appears to be that butter quality has been retrograding during the past few years. The discussion of Thursday evening is indicative of the situation and the importance attached thereto. "Lowering of Butter Grades," by A. Jensen of San Francisco; "Competition and Quality in Creamery Work," by G. E. Frevert of Salt Lake City; "The Responsibility of the Creamery Operator in Relation to the Quality of California Butter," by S. N. Greene of San Francisco. It was all on quality, and there were three hours of it, the discussion not closing until nearly eleven o'clock. Professor Davis' paper, on stock page, was presented at the morning session, and the reader will see that it is about quality. The butter maker says he cannot make good butter out of poor cream, which implies that the dairyman does not deliver his cream in good condition. This is the beginning, and if a bad flavor injects itself into cream it is mighty difficult to eject it anywhere along the line of manufacture. I hope in a later report of the convention to go more into detail on the subject of

GROW INOCULATED LEGUMES

Alfalfa, Clover, Vetch, Field Peas and Beans

Inoculate Forage, Cover and Green Manure Crops with

The Improved German Soil Inoculator, Nobbe-Hiltner Process

NITRAGIN

TRADE MARK REG'D DEC. 6, 1898 NO. 32212

PURE CULTURE

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

ALFALFA

GUARANTEE

THE BACTERIA CONTAINED IN THIS PACKAGE ARE GUARANTEED TO RETAIN THEIR VITALITY AND VIRULENCE FOR SIX MONTHS FROM DATE OF SHIPMENT

"NITRAGIN" is the wonderful germ that unites with the legume root and draws from the air the precious *nitrogen*—necessary to *all* plant life, health and growth.

Failure to get a stand or a perfect "catch" is nearly always due to the absence or weakness of the nitrogen-gathering germ. "NITRAGIN" Pure Culture gives to your legumes *billions* of these active, vigorous germs; as a result the plants grow quickly and luxuriantly; they are big, strong, healthy, deep-rooted.

A legume inoculated with "NITRAGIN" Pure Culture is the best *shade or cover crop* because of the quick growth, vigor and luxuriance of plant, and because it is a *soil-enricher* instead of a *soil-robber*. It is the best green manure crop because of the immense quantity of new nitrogen it adds to the soil and the extra richness of the humus.

"NITRAGIN" Pure Culture is the *original*—discovered by Nobbe and Hiltner, famous German bacteriologists; it has been improved and perfected by twenty years of testing and proving. It comes to you in *granular* form, packed in ventilated tin cans. Easy to apply—ten minutes work—a boy can do it.

Alfalfa—You can't afford to risk failure on this wonder crop. For Alfalfa success, inoculate the seed with "NITRAGIN."

"NITRAGIN" invariably insures a perfect "catch," quick growth, enormous yield and extra food value.

Inoculate *all* legumes with "NITRAGIN" Pure Culture. A special strain for each legume—27 varieties.

Pure Culture inoculation is endorsed by Government authorities, state experiment stations, practical farmers, agricultural experts and soil culturists. Let us send you testimonials and other *proof*.

Price: Garden size $1.00 per can; acre size $2 per can; 5-acre size $9 per can. F. O. B. Postage and express extra. Parcel Post, 10c per acre extra. Ask your seedsman or fertilizer dealer for "NITRAGIN."

Prepared in the Laboratories of the German-American "NITRAGIN" Company, Milwaukee, Wis.

Citrus and Tropical Fruits

DISEASES OF THE OLIVE

By W. T. Horne

Before State Fruit Growers Convention.

IN a general way the olive is one of our most sturdy and healthy trees. When planted within the regions adapted to its culture it is tolerant of minor variations in soil and weather and is comparatively free from serious diseases.

Root Diseases.

Fungous root rot or oak fungus disease is the same trouble which affects most of our orchard trees. The fungus spreads to healthy roots from infected wood lying in the soil. The bark is first killed in a very characteristic manner, and the wood of the root decays gradually with a moist yellowish white uniform rot which progresses until the root is completely destroyed. The fungus goes over from one root to another, so that after one tree dies, usually in a few years those next to it die also, and a spot is formed in the orchard which continually enlarges. There is as yet no simple and single treatment for this trouble, but by careful study some means can probably be found to combat it in most situations.

The olive appears to be free from injury by crown gall or nematodes. Olive knot appears on exposed roots, but seems unimportant as a root disease. Cultivation so near the tree as to cut and mark the roots is wrong and should be avoided because such cuts give opportunity for wood decay and favor infection with olive knot.

Diseases of Trunks, Branches and Twigs.

Olive knot, or tubercle disease, is a disease primarily of trunks and branches, although exposed roots and leaves may be infected. It consists of localized abnormal enlargements or galls. These are usually about the size of walnuts on healthy twigs, but on weakened small twigs are much smaller, sometimes scarcely noticeable. On the thick bark of the trunk they may be several inches across. The knots are distinguished from the normal enlargements on olive trees by the fact that the normal structures remain healthy and green and give rise very often to new shoots. The olive knots, however, crack and the outer part dies while the inner part usually continues to grow for several years, finally forming a deeply cracked growth with the outer parts dead and pushed apart. When the knot is cut open it is found to be a mixture of bark and wood with watery cores or pockets in the center which later dry out.

The result of olive knot on the tree varies with the number of knots formed. A few knots apparently do little harm. Many knots choke and depress the vitality of the tree. I have not seen a tree killed by it, but some seen have doubtless been rendered unprofitable. It is important enough to merit serious consideration by the olive growers and it should be avoided or eliminated if possible.

One serious feature of olive knot is that it becomes worse with increase in the vigor of the tree. Gain in size and number of olives per tree will be accomplished largely by increasing the vigor of the trees. Therefore we may expect the disease to become more serious as the culture of the olive is improved.

The cause of olive knot is a specific kind of bacteria. These bacteria live in the fresh, moist part of the knots and sometimes work out into little pockets in the wood immediately below the bark, or in twigs sometimes get into the pith. They are not distributed throughout the healthy parts of the tree nor are they in the soil nor in manure. Practically they live only in the living knots or very near them.

Olive knot spreads through the bacteria being washed out of the knots by rain, by subsequent spattering and by accidental methods of transfer from tree to tree while the trees are wet, and by being washed down into crevices in the bark or by being brought into contact with living inner bark through being washed into new wounds. We believe there is no spreading of the knot while the trees remain dry. After a day or two of rain whitish drops can be seen in the cracks in the knots. If a little of this whitish liquid is pricked into healthy bark a knot begins to grow after a few weeks. If the whitish material is examined with the microscope it is found to contain great numbers of the bacteria which cause the disease. These bacteria can be grown rather easily in cultures and studied. One

San Dimas Citrus Nurseries INC

ESTABLISHED 1890 BY R. M. TEAGUE

San Dimas, Cal. U.S.A.

of the most interesting facts about them is that they are very easily killed by drying or exposure to sunlight. All the bacteria which might be on the surface of a tree after several days of rain would be killed by one day's exposure to bright sunshine. Some, however, might be protected from light and drying in crevices of the bark and would continue to live.

Remedies suggested up to the present consist in cutting off the knots on the trunks and larger limbs. The knots should be cut to the level of the sound wood and perhaps one-eighth inch of bark removed about the knot. The cut should be made so that a smooth, flat surface remains for healing over from the edges. Some knots will reappear at the edges of the cuts and these should be removed as early as possible. All cuts should be immediately washed with a disinfectant. Corrosive sublimate, one part to 1000 of water by weight, is recommended. The first cutting should be made in early summer and the second in early fall, and the process repeated each year. At the fall treatment the wounds should be coated with asphaltum to prevent wood decay. So far as possible twigs with knots should be pruned out, but I do not now recommend excessive reduction of the bearing wood, as I hope within a few years to get results which will justify me in recommending a definite course of treatment.

Withholding water or in any way reducing the vigor of the trees cannot be recommended. No varieties are immune, though the Mission is doubtless much less injured than the Manzanillo. The most desirable varieties should be planted regardless of knot resistance. Probably many oil olives can be profitably grafted over to pickling varieties, but where the trees are infected with knot I should recommend that the knots be carefully eradicated from the tree one or two years before grafting over. Several varieties of oil olives are very susceptible to knot, as well as being undesirable in other ways even for stocks. I have not observed the comparative resistance of the Ascolano.

Wood Decay.

This is an important factor with olive trees, although its results will not be seen so quickly as with trees ike peaches. We have repeatedly found olive trees infected with wood decay fungi from pruning wounds and sunburn.

Exanthema.

Exanthema is a disease of olives not previously reported. Several years ago a case was called to my attention and examined in a preliminary way, in which the symptoms corresponded very closely with those of exanthema of citrus trees. It was called exanthema in my notes. The disease consists in the dying back of growing tips and the pushing out of numerous shoots from the nodes beow. There is a more pronounced puffing of the bark than in citrus rees, with areas of dead tissue in he puffed regions and an unusual prominence of the lenticels. During he past year the disease has been much more carefully studied by Proessor Smith and Mr. Boncquet and believe the general correctness of my idea of the disease has been supported rather than disproved.

The trouble appears to be associatd with defective drainage and peraps alkali, but these may not be the cause. It seems to be as serious for the olive as exanthema is for citrus fruits, but thus far has not appeared widely distributed.

Leaf Diseases.

Leaf-spot is the name given to the disease caused by the fungus Cycloconium oleaginum. Rather large sooty spots appear on the leaves, but apparently cause only slight injury. Some leaf spot diseases of other countries have not come to my attention from California. I am not aware that any of these are particularly dangerous.

Fruit Diseases.

Dry Rot is of rather common occurrence, especially on some varieties. Sevillano is said by some to be especially susceptible. I do not know the cause of this trouble nor any remedy to suggest.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Appointment of Guardian.

A. is a weak old man of 75 who has deeded to his housekeeper his home and all the furnishings, reserving to himself a life interest. In January of this year the deed was recorded. The children of A. wish to know if there is a possibility of getting the old home back into the estate. The value is about $4,000.00. Is it best to await the demise of A., or have a guardian appointed and sue at once? What must be shown to get appointment of a guardian?

In order to procure the appointment of a guardian it is necessary to file a petition verified by the oath of a relative or friend of the old gentleman, stating facts to show that he is mentally incompetent to manage his property. The phrases incompetent, mentally incompetent and incapable are defined as meaning a person, who although not insane is by reason of old age, disease, weakness of mind or from any other cause unable unassisted to properly manage and take care of himself or his property, is by reason thereof likely to be deceived or imposed upon by artful or designing persons. For many reasons it would be far better to have a guardian appointed and empowered to take such proceedings as may be necessary to properly protect the property of the old gentleman and procure the return thereof.

Trespassing Stock.

If one cultivates a garden or orchard must he fence against stock which the owner may allow to roam at will? What protection has one under the state law; also, do different counties have ordinances covering this matter, or have they power to enact ordinances covering the matter?—Subscriber, McFarland.

Under the common law of England the owner of animals trespassing upon unenclosed property could be held liable in damages for all injuries to said lands or the crops theron. The stockmen in the early days of California procured laws changing this rule so that no damages could be recovered where the property was not enclosed, and suits brought by the owners of unenclosed property against the owners of stock were merely thrown

Deciduous Fruits

PLANTING AND CULTURE OF ALMONDS

(Continued from Page 387)

soil and climatic conditions of the section in which you propose to plant.

Planting.

The almond, being a long-lived tree that attains large proportions, needs more space than the average deciduous orchard tree. It requires a large area from which to draw nourishment and obtain sunlight. Early orchardists in California planted almond trees from 16 to 20 feet apart. Many of these later dug out every other tree. Many who did not do this finally dug them all out. It is best not to plant the trees less than 25 feet apart. Some of the wide spreading varieties should not be less than 28 or 30 feet apart. There are two methods of planting. The one largely used is where the trees are equally distant in the rows and between the rows. Its chief disadvantage is a large open space between each series of four trees. Another and more equitable one so far as the trees themselves are concerned is the equilateral triangle method. In this the trees are equally distant from each other in the several directions. The chief objection to this method is that cultivation is somewhat hampered.

Before planting have the ground well plowed, harrowed and free from large clods. Do deep plowing and break up any hardpan that may be there as a result of previous shallow plowing. You cannot do this after planting. It is most essential that this be done to induce roots to seek permanent moisture below.

Be generous with the trees in digging holes. Dig a hole large enough to give the spreading roots ample room to straighten out. Dig deep enough so that you can put some fine surface earth in the bottom of the hole to bring the tree up to about the height it stood in the nursery. Fill the hole at least half full of well pulverized surface earth before returning any soil taken from the hole. Clods in a tree hole mean air spaces that will dry out the roots.

Too much care cannot be given to the nursery stock you plant. Get the best stock obtainable. A tree that has been neglected or badly handled in the nursery will prove poor property. One cannot afford to accept such a tree as a gift. Get good healthy stock, but do not imagine you must get a tree full grown. A tree of medium growth is better for planting. Look well to the roots of the nursery stock; they are the dividend payers. If they are numerous and healthy you can grow a top cheaper than you can buy it. As the very existence of the tree, not to mention its productivity, depends chiefly on its root system, that system should be as near perfect as it is possible to realize. Almond nursery stock is usually on almond root, and in most instances it is the best. It gives a hardy, long-lived tree with a great network of roots, some of which penetrate the soil to considerable depths in search of moisture. Almonds on peach root are shorter lived and require more moisture.

Frequently the roots are bruised or broken in digging. These damaged roots should be cut off. The remaining ones should be spread out in the hole in such a way that when they grow the tree will receive sustenance and support from all directions. In cutting the roots cut in a slanting direction from the under side of the root so that the freshly cut part may rest on moist soil. It is well to dip the roots in thin mud at time of planting to exclude air and assist in starting growth. If the soil be dry at time of planting five or ten gallons of water thrown into the hole will greatly help the tree in beginning the struggle for existence under new and frequently trying conditions.

When the tree is planted cut the top off to within about 18 inches of the ground. Cut in a sloping direction on the north side of the tree to prevent exposure to the sun. Leave a bud near the top on the south side of the tree that early development may protect the wound. Shield the body of the tree from the blistering rays of the sun and the depredations of animals and insects. Specially prepared tree protectors can be obtained easily and cheaply in the market. If these be not available, paper, burlap, shakes or whitewash will, if installed in time, prove a good investment.

Cultivation

Cultivate thoroughly to retain moisture in the soil as well as to destroy noxious weeds. A well pulverized soil surface for the summer months is a contribution to future success that you cannot afford to neglect. It retards the evaporation of moisture stored in the earth by winter rains, thus forming a reservoir to be drawn upon as needed. One must not lose sight of the fact that the period of annual growth and activity of the almond extends over the greater part of the year. If the tree is to have vigorous buds from which to mature profitable crops, conditions must be such that the moisture nature intended for the tree shall be available at the proper time. In the wild state in most instances the trees find sufficient moisture to maintain existence. With the domestic tree, however, additional burdens are added. It must not only maintain its existence, but it must produce profitable crops.

Pruning

Beginning with the second year shape the tree for further usefulness. Start it low down as a matter of protection to the tree itself, also to shade the ground, to prevent evaporation and for convenience in harvesting the crop at time of maturity of the tree. Carefully train main branches so that nuts may be produced on all quarters of the tree. Do this carefully and later pruning will consist of an occasional thinning out only. Remove all water shoots or suckers. They rob the tree of much of its substance that should go to the crop.

Troubles

The almond tree, while perhaps as free from insect and other pests as any other cultivated tree, still has its troubles.

Shot hole fungus sometimes appears. The ravages of this can be checked or lessened by spraying with Bordeaux mixture during the dormant period of the year, and at the beginning of blooming.

The peach moth is a worm that at times causes much damage to the almond crop if neglected. Should it appear treat it with a mixture of Paris green and lime in the proportion of about 1 to 20. Apply with dust spraying apparatus.

Red spider is the most persistent insect pest of the almond tree. It is effectively handled by spraying with sulphur. Any of the flowers of sulphur will prove effective. It is best to mix the sulphur with lime as a carrying medium in the proportion of 25 to 50 per cent sulphur.

If sulphur is to be applied at the same time that the peach moth needs attention, add Paris green to the sulphur and lime mixture and save one spraying. These suggestions have been made on the supposition that the average almond grower will use a dry rather than a liquid spray. The dry spray is much more economical in its application than is the wet. It is far less disagreeable for the operator and has generally proved itself effective when properly applied. For a dry spray use lime, 40 pounds; sulphur, five pounds, and Bordeaux, three pounds.

A home-made mixing machine is easily constructed. Take any good heavy barrel, bore a hole in the middle of each head and put a round shaft completely through the barrel, leaving it project at each end far enough to give bearings on which to revolve. Put a crank on one end. Cut a door in middle of barrel at point of greatest diameter and fix so that it can be tightly fastened. Put in materials and turn until all are thoroughly mixed.

The best way to apply the dust spray is with a specially prepared dust spraying machine. These are made in different sizes. The smaller ones are made to run by chain geared to a sprocket which is attached to a wagon wheel. The larger ones are run by gasoline power. Those geared to the wagon wheel are cheapest and easiest to operate. They are efficient and well adapted to the needs of the average grower. The first cost is moderate and anyone having the least adaptability to machinery can run them. Add to this a man, a span of horses and a wagon and the equipment is complete. Having this, use it. The ingredients for the mixture cost but little. The ravages of the insects and other pests run into dollars very fast.

Use the dust spray early in the morning while the dew is on the foliage. Begin on the side of the orchard from which the wind is blowing. Drive alongside each fourth row. The machine will blow the spray high into the air. In settling it will be distributed over the entire adjacent trees. Repeat this operation several times each season, each time going in different rows. It is best to select for spraying a morning when there is a dew and but little wind.

Harvest

Provide yourself with some kind of mechanical huller and separator. Life is too short and time too valuable to hull almonds by hand. While there is some loss from machine hulling and separating it is more than offset by the saving in expense and the lessening of the number of employees. Machines of varying capacities and more or less efficiency are in the open market. While the almonds may be left on the tree for a time after the hulls have been opened, without serious loss, it is best and most economical to gather them as soon as the hulls open and expose the nuts sufficiently to hull easily. If left much after this time some of the hulls will begin to dry and draw closer to the nut, making hulling more difficult. Then, too, the nuts will begin to fall to the ground of their own accord. Should a heavy wind occur at this time many nuts will be blown from the tree. The expense of picking almonds up from the ground is fully three times that of gathering them in the usual manner. Promptness pays in the handling of almonds. Be ready for the harvest and have a crew of gatherers in proportion to your acreage.

Provide canvas sheets to spread beneath the trees on which to knock the almonds. The size of the sheets needed will depend upon the size of the trees in the orchard. Have two sheets for each tree. The two sheets when spread out should cover from 24 to 40 feet square. It is false economy to use a sheet too small for your trees. Almonds will be continually knocked off the sheet on to the ground, thereby increasing the cost of gathering, to say nothing of the many nuts that will not be picked up and thus become a total loss. The methods of using almond sheets vary with the whims and ingenuity of the users. Some spread the sheet beneath the tree, knock the almonds and either box or sack the product of each tree, direct from the sheet. If but few nuts are obtained some drag both sheet and nuts to the next tree before sacking to save time. Another and better way is to have a sled 16 feet long, about 40 inches wide and 6 inches high, with a tight bottom. Have one end of the sheet tacked to one side of the sled. Have boxes ranged inside sled along the side next to sheet and when sheets are emptied the almonds go directly into the boxes. Another and still better way is to have a 16-foot pole sewed into a part of one end of each sheet and have that pole on arms so hinged to the sled that the sheet may be used on either side of the sled. In this way two rows can be gathered at once and thus save time in moving. While boxes are largely used to move almonds from the orchard to the almond shed, they are expensive and deteriorate rapidly. Their hauling and the gathering up of surplus boxes consume time.

Many growers use grain bags. They are easily carried on the sled, cost but little to distribute, and there are no stragglers to gather up. When bags are used, dump almonds into sled and have one man shovel them into a sack, using a simple device for holding the sack, while the others are knocking the next tree. If you are in the grain business as well as almond growing, use new sacks for your almond work. After the season is over put the sacks away carefully and use them for grain the following year. In that way the sacks for almond use cost you nothing save the interest on the first investment.

One good heavy horse will pull an almond sled from tree to tree and save much of the wear and tear incident to dragging sheets over the

ground. If you employ labor you will find it not averse to having the horse do what men would otherwise be expected to do.

Gathering

To knock the almonds from the tree good, tough, springy poles should be used. The poles should be as light as consistent with the service expected. A tamarack or fir pole 16 to 24 feet long and about an inch and a half in diameter at the butt is an ideal pole for knocking almonds. Take the bark off while green. If too heavy at the butt end shave it down so that it can be easily handled. Tie in bundles to keep straight and store inside the house. With proper care and careful handling a good pole will last several seasons. Sawed Oregon pine lumber is sometimes used for poles, and if good lumber is obtained the result is a good pole. Hickory, too, is used with good results. Bamboo has been tried, but while easy to handle, it cracks so badly when exposed to the sun that it can hardly be considered a success. Have your crew use poles of different lengths. One or two very long poles is all that is needed at a tree. Almonds on the lower limbs can be gathered more cheaply with short poles. If the trees be old and extremely high, have a man climb into the upper limbs with a short pole.

Do not imagine that because you have a pole you must necessarily beat the tree to loosen the nuts. Put the pole between the branches and vigorously work it back and forth, shaking the limbs and loosening the nuts. Some seasons almonds are harder to knock than others and require harsher treatment, but remember that tree is your friend. Do not permit it to be abused. The buds you knock off this year may be the ones that next year would be fruitful. Every limb you break off means a wound to heal. Every unnecessary burden placed on the tree draws from vitality that should be expended in the production of nuts.

Hulling

Almonds should be hulled as soon after gathering as practical. Spread the clean nuts in the sun to dry. Tip the trays slightly toward the south that the nuts may dry quickly. The time allowed for drying depends upon the condition of the nuts at the time of gathering. No almonds should be sulphured until sufficiently dry and brittle to break without bending. A good and convenient size of tray is one three feet wide by eight feet long, having two-inch sides. In the early part of the season while the nuts are quite green they should be raked frequently in the trays to insure drying quickly, and evenly and to prevent mold.

Sulphuring

When the nuts are thoroughly dry the outer shells should be slightly moistened that they may readily take sulphur and be bleached in the shortest possible time. Great care must be taken in sulphuring lest the kernel be affected. Should this take place the nut will soon become rancid and be ruined. Less bleaching is being done now than formerly. Stack the trays of nuts on a car and run them into a sulphur house. Twenty to 30 minutes is sufficient for paper shell varieties. Soft shells would take a little longer. Hard shells are rarely bleached and never are when used for nursery purposes. After bleaching the car containing the almonds should be allowed to stand 24 hours in the open to permit the almonds to become dry. Do not expose them to the direct rays of the sun after bleaching, as it will darken them. When thoroughly dry sack and they are ready for market.

Marketing

We have now reached a very critical stage of the almond business. It is the goal we have long had in our mind's eye. After all the months of anxiety, is our year's work to be a success? Having the crop, it all depends on the marketing. Almost anyone at all adapted to the business can attain average success as a grower. To dispose of the crop to the best advantage, and at the same time to do something to build up the industry and place it on a firmer commercial basis is a task worthy of the best business ability. The latter requires a different sort of ability, a special training and time to devote to the work which the average grower has not at his command. A grower, in the disposal of his product, comes in competition with, or deals with expert salesmen. The grower is at a disadvantage. He has not the data upon which to base conclusions and establish values. He is not familiar with the tricks of the trade. He may occasionally make a creditably fair sale, but in the long run the experience of the specially trained man will beat him. The trade is organized. The grower must meet organization with organization. Organized producers hold the whip hand. Singly, they are easy prey. It is one thing to produce an almond. It is quite another thing to sell it.

Previous to 1910 the almond growers of California were without effective organization. In that year the California Almond Growers' Exchange was organized. Since that time the output of the state has greatly increased, foreign importations have increased at the same time, but prices have been much better, markets have been steadier and speculation in our products has been largely eliminated. Improved conditions generally prevail. Cooperative buying of supplies has proved an economy. New markets have been exploited. Further exploitation will be necessary when the recently planted orchards come into bearing. Lend a hand in the business end of the occupation. You are needed. The benefits will be mutual. Join a local association. Present your troubles, for you will have them, to the organized growers. Get the benefit of their combined intelligence and experience. Get the benefit of the expert salesmen employed by them. In other words help develop and protect the almond industry. Remember there are two equally important branches of the almond business. The first is the production of the almond. The second is its marketing.

RIVERSIDE FAIR

Saturday at the Riverside fair was called "Everybody's Day," and it seemed so from the crowds which attended. The day opened with one of the finest stock parades the southern end of the state has seen for years. The blue ribbon winners led off with high heads as the bands played the marches. The exhibits were fully up to the best, excepting, perhaps, the implement exhibits, which for some reason were not so extensive as one would expect. The poultry exhibits brought out some very fine specimens, though in much fewer numbers than was hoped. The dairy classes were well filled and some remarkably fine animals were in the stalls. Livestock men from many sections of Southern California were present with blue ribbon winners.

Financially, the management announces that the fair was a complete success. This statement was issued by one of the officials:

"The attendance every day has been beyond our expectations—we could hardly have handled larger crowds. All expenses of premium awards and other expenses of the week will be met, and I believe we will have a balance to apply toward permanent improvement. The officers of the association are certainly appreciative of the way the people of Riverside, of the county as a whole, and of the neighboring cities have supported us. It makes our annual fair a certain success, and we will be able, with the encouragement of this sucess, to make it bigger and better next year."

The final feature of the fair was the horse show of Saturday evening at which roadsters, fancy harness animals, hunters and jumpers combined with Riverside's best society in making a notable social function.

The management is already planning for another and greater fair for 1915.

Under right conditions, one can perform an incredible amount of labor and suffer no ill effects, while half that amount to which one is driven, is irksome.

FOOD VALUE OF AVOCADO

Mr. Chappelow of Monrovia writes: "I have lately sent samples of fruit from the original 'Chappelow' avocado tree for analys's to the College of Agriculture, Berkeley. I have just had returns, which are as follows:"

Weight, edible portion	139.0 grams
Weight, skin	19.5 grams
Weight, seed	22.0 grams
Total weight	180.5 grams

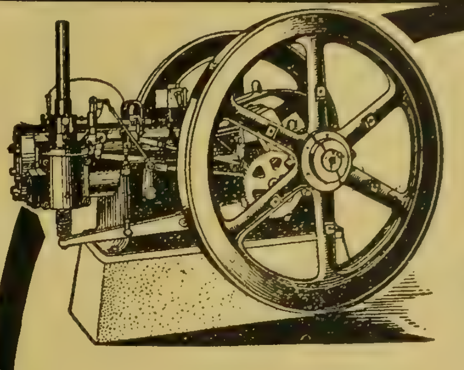
Analysis of edible portion:

Water	60.94 per cent
Protein	1.40 per cent
Fat	29.10 per cent
Ash	1.71 per cent
Carbohydrates, including crude fiber	6.55 per cent
	100.00 per cent

This makes a splendid showing. —Wm. Chappelow.

The exposition grounds at San Diego were visited by over 13,000 people last Sunday.

DEPENDABLE POWER AT LOWEST COST



The price you pay for an engine is an important consideration. But the amount of steady power the engine will develop on a given quantity of fuel is a consideration of *still greater* importance.

Consuming Special Gas Oil at 2¾c per gallon, WESTERN GAS ENGINES cost one-third of a cent per horse power per hour to operate.

WESTERN GAS ENGINES are perfectly balanced and proportioned throughout—no excess friction to overcome—the highest possible percentage of fuel is converted into directly transmittible power.

Our catalogue makes the whole engine question plain—if you have a power problem write for a copy.

WESTERN GAS ENGINE CORPORATION

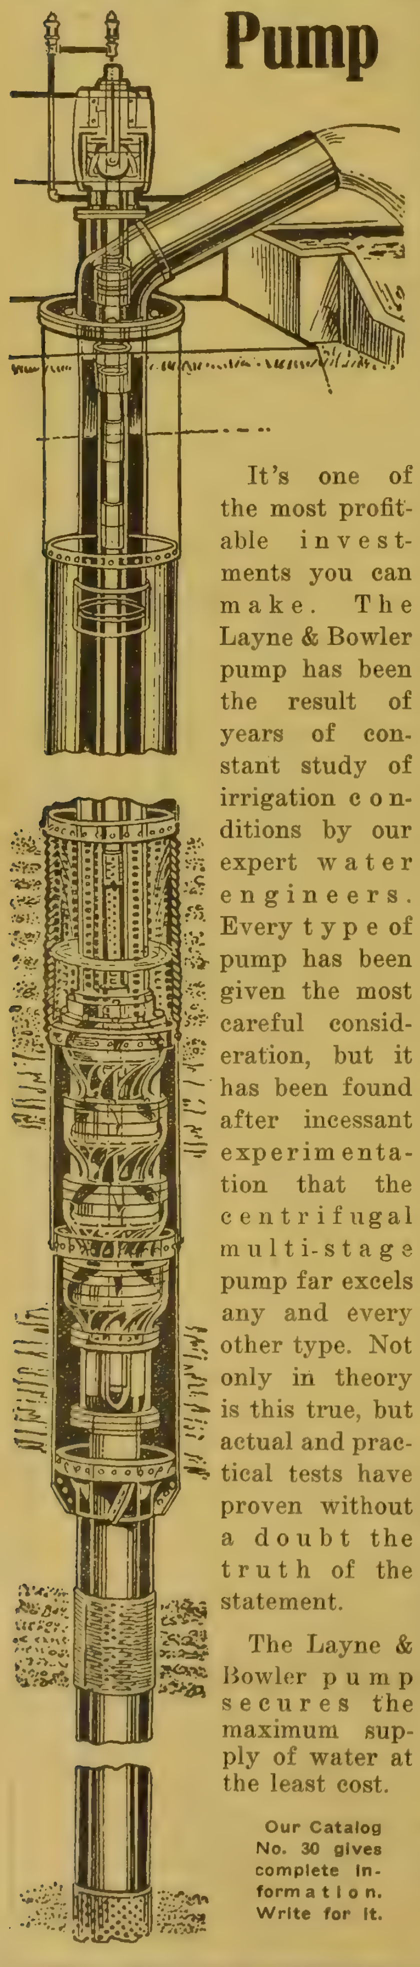
BE ON THE SAFE SIDE OF THE IRRIGATING QUESTION

There Should Be No Need To Worry About Your Water Supply If You Install The

Layne & Bowler Pump



It's one of the most profitable investments you can make. The Layne & Bowler pump has been the result of years of constant study of irrigation conditions by our expert water engineers. Every type of pump has been given the most careful consideration, but it has been found after incessant experimentation that the centrifugal multi-stage pump far excels any and every other type. Not only in theory is this true, but actual and practical tests have proven without a doubt the truth of the statement.

The Layne & Bowler pump secures the maximum supply of water at the least cost.

Our Catalog No. 30 gives complete information. Write for it.

THE VALUE OF FALL PAINTING ON THE FARM

Written for California Cultivator by Roy C. Sheeler

THE use of paint on the farm is not an expense. It is a tremendous asset, provided the right kind of paint is used and it is applied the way it should be. Well painted farm buildings spell prosperity in capital letters.

Results obtained by paint depend upon several things. First, the selection of the paint. In times past white lead and linseed oil have been considered standard paint materials. Scientific investigation and tests, however, have proved that these do not give the maximum protection. While paint is a beautifying agent its main purpose is to afford the necessary protection from the elements to the surface on which it is used. It is a well-known fact that carbonate of lead is one of the easiest pigments to break up and incorporate with linseed oil. If carbonate of lead is examined under the microscope, it will be found to consist of large, irregularly-shaped crystals which do not intermingle with one another but leave large open spaces between them. The formation of carbonate of lead can be compared to a number of coins laid edge to edge. They do not fit together closely, but leave spaces between them. A paint composed of carbonate of lead and linseed oil, when mixed by hand, will have such open spaces in it, allowing the moisture and dampness to penetrate the lumber and cause the paint coating to peel and crack. Even if the basic elements just mentioned were found to produce the best results, yet if mixed by hand the paint will not have the covering capacity nor the durability of a paint made by the up-to-date paint manufacturer who uses modern machinery in the manufacture of his product.

The reliable paint manufacturer today, who puts out a trade-marked brand on which dependence can be placed, has found that a combination of certain pigments overcomes the chalking and cracking incident to the use of carbonate of lead only when mixed with linseed oil. Such a paint, if stirred thoroughly so that no pigment is allowed to remain in the bottom of the can, and brushed out well when applied, will present a smooth, solid coating through which moisture cannot penetrate. You will therefore see that if no moisture is allowed to go through the paint coating the lumber must be preserved from decay.

Second, the time of applying the paint has a great deal to do with its wearing qualities. In the fall the heat of the summer has dried out the lumber, putting it in condition to absorb the paint coating to the largest degree. It is extremely important that the surface to be painted should be absolutely dry. Some paints when used over damp surfaces do not crack or peel, but are so porous that the moisture passes through it. Such a paint is not fit to paint with, for it stands to reason that if it allows the moisture to pass through it from the lumber it will also allow the rain to pass through it to the lumber, thus failing completely to perform its duty as a protective covering. The presence of insects is diminished in the fall so that the appearance of your building will not be spoiled by their coming in contact with the painted surface. After the grain has been harvested and the majority of the heavy farm work done, you could have the painting of your house, barn and other outbuildings done at odd moments.

Third, the method of applying the paint. If a package of mixed paint is bought, the can opened and not stirred thoroughly so that the pigment is mixed with the oil perfectly, you will not obtain the proper covering capacity nor the protection you should from such a paint. A paint must be stirred so that no pigment is allowed to remain at the bottom of the can. This may take a little time, but it will be worth while. If the building has not been painted for some years and the present paint coating has almost entirely disappeared from the surface, you should add from a pint to a pint and a half of pure raw linseed oil and a half pint of pure spirits of turpentine to each gallon of paint for the first coat. Make sure, however, that these thinners are absolutely pure. There is nothing that will kill the life of a good paint quicker than to use some of the doped and cheap oils and linseed oil substitutes on the market. See that the first coat is brushed out well. By adding these thinners you will insure deep penetration of the first coat, which is absolutely necessary for the best results. The second coat of paint should be used just as it comes from the can, after seeing that it is thoroughly stirred. See that this coat is brushed out well also. Much better results will be obtained by the use of two thin coats, brushed out well, than by one heavy coat.

ALKALI AND ITS TREATMENT

By R. F. Hare, Chemist, New Mexico College of Agriculture

Alkali is an accumulation of soluble salts formed from the weathering of the rocks and retained in the soil because of insufficient rainfall to leach them out into the streams and thence to the sea. The heavier precipitation in the mountains and highlands causes a partial leaching of these salts and a resulting concentration in low places in sufficient quantity to injure plants or wholly prevent their growth.

The term "white alkali" is a misnomer, since the salts composing this "alkali" are all neutral. Sodium chloride (common salt), sodium sulphate (glaubers salt), and magnesium sulphate (epsom salt) are the salts usually present in this alkali. They are associated with some carbonate of lime and gypsum that are not only harmless, but may be beneficial.

The term "black alkali" is given to carbonate and bicarbonate of soda (sal soda and baking soda). They are true alkalies, and because of this property, will corrode the stems of plants. For this reason they are very much more injurious than the neutral salts constituting white alkali. They are called "black alkali" because they dissolve humus and form a black deposit when brought to the surface during dry seasons. Black alkali cannot exist in the presence of gypsum, which is its chemical antidote. Since gypsum is present in Rio Grande water, no soil irrigated with this water will be troubled with black alkali. The moist, "greasy" spots in this valley sometimes called black alkali, are more likely due to come of the neutral deliquescent salt called calcium chloride, mixed with the white alkali salts named above.

Treatment

No chemical antidote is known for white alkali, as is the case for the black alkali. It must, therefore, be removed by mechanical means. When the water-table is so near the surface that capillarity is established (i. e. "subbed land"), the only remedy is drainage. Experience has shown that where "subbed" lands have been drained they are rendered highly productive.

Alkali can sometimes be leached from the surface to the underflow waters, or beyond the point at which they are likely to rise by capillarity to the surface. Attempts to wash the surface accumulations to a lower locality are not very successful, because of their extreme solubility and the readiness with which they soak into the soil. Attempts to remove alkali by "absorbing" it with certain growing crops have proven very unsuccessful.

Frequent cultivation and irrigation, or any treatment that will prevent surface accumulation, is desirable, because the damage is likely to result near the surface; hence the alkali should be kept down.

Tolerance to Alkali

Fruit trees, as a rule, are quite sensitive to alkali. Pears and figs are the most resistant. Cottonwoods, mulberries and willows are resistant ornamental trees.

Kaffir corn, milo maize and all the sorghums are quite resistant to alkali, as are also barley, and, apparently, some varieties of wheat. Bermuda grass will stand large amounts of alkali; as will old alfalfa, unless the alkali is from "subbed" land in which case the alfalfa might die from excess of water around its roots.

Veterinary Queries

Answers in this column by Dr. Wm Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Milk Suppression.

I have a three-year-old heifer that calved yesterday, but she has no milk. I have not milked her for four weeks. When I started to dry her up she was giving six quarts of milk a day. She is in good condition and was never sick in her life. Am feeding pumpkins, alfalfa hay and green alfalfa. Did I let her go dry long enough and will she come to her milk again? —Subscriber, San Jacinto.

No one has yet discovered the cause for the milk not starting in such cases as you describe, but the records show that now and again just such cases do present themselves. Treatment in a general way only can be suggested. Give plenty of sloppy feed and rub the udder with the hands and go through the motions of milking for ten minutes or more at the regular time of milking. This has started some cows and they came to their milk again as good as ever. This is only another case to prove that what has been said before in these columns is true, that is, that more damage is done in drying up cows than in milking them as long as they give any milk. When a cow is doing well do not try to change her habits.

Scours

I would like advice about my sick calves. They get sick when from one week to two months old. The first symptom is scouring. In two or three days they stop drinking milk and take very little water, and in five or six days most of them die. Three or four days after they are taken sick they also show difficulty in breathing. Post mortem examination shows inflamed bowels and lungs. Last year the same trouble occurred. Called a veterinarian and he did not seem to know what was wrong, only said it was bowel trouble and advised giving castor oil but it did not seem to do them any good. I feed them sweet milk for 15 days then change to skim milk and add a handful of middlings. What can be done for them?—Subscriber, San Luis Obispo.

There is surely something wrong about your place, either in the water, feed or surroundings. Would advise whitewashing everything where the calves are kept and put lime on the discharges from the sick ones. As soon as one is noticed ailing put it by itself in a small enclosure and sprinkle the place white with lime. You can often get a barrel of air-slaked lime from a dealer for little or nothing. For treatment give Zenoleum. Put a teaspoon of the Zenoleum in a teacup of water. Stir well and give a teaspoon of the solution with two or three tablespoons of milk at one dose. Repeat this three or four times a day. This treatment will generally cure scours in a day or two. Zenoleum is a good disinfectant and germicide and you would do well to have a quantity on hand. Another good remedy for scours is Tannoform. Give 15 or 20 grains once a day for a week. It may be given in a little milk or on the tongue. If you are feeding milk that comes from a separator you should add some fresh milk to it. It is said that the air that is forced into the milk by the separator causes indigestion.

Broken Wind

I have a fine mule that acts as if he was just off a fast drive or long pull. He puffs for want of breath but does not sweat much. He does not seem to be able to get enough air into his lungs, and he puffs when he is not working. Otherwise he is very healthy. Your advice will be appreciated. — Subscriber, Tulford, Florida.

It may be broken wind or heaves, or sometimes in the fall of the year the hair on an animal gets very thick and seems to close the pores of the skin, and we find such symptoms as you describe. We would suggest that you clip him and then give him a good grooming every day. For internal treatment get the following: Tincture of aconite four ounces, tincture of digitalis eight ounces, tincture of stramonium 12 ounces and spirits frumenti enough to make one quart. Mix and give half an ounce on the tongue morning and evening. Get a black rubber syringe that holds one-fourth of an ounce and give it twice full for a dose, or maybe he will eat it in some ground feed.

Lymphangitis.

One of our mules has a badly swollen hind leg. She was taken with what seemed to be cramps in this leg and then it began to swell. It is swollen from the ankle way up into the udder. What is the cause of this and what would you advise as a remedy?—Subscriber, Hinkley.

Inflammation of the lymphatic glands retards the circulation and the refuse matter is not carried off, so of course the parts swell. It is caused by overfeeding and a sluggish condition of the circulation. To get relief a good purge is necessary. Get a pint of raw linseed oil, two ounces of turpentine and four drams of aloin. Mix and give at one dose. Following this get your druggist to prepare the following powders: Nitrate of potash eight ounces, powdered gentian three ounces, powdered nux vomica two ounces and bicarbonate of soda three ounces. Mix and divide into 20 powders. Give one powder every night. Rub the limb with a stiff brush several times a day and exercise the mule some, but not to the extent of hard work. If the swelling does not leave soon, then use this lotion: Chloride of zinc one ounce and water one gallon. Mix and apply enough to wet the swollen parts once a day. The lotion will do more good if you warm the amount you use just before applying it. Do not pour it into a metal dish. Warm it in an earthen or granite dish.

Coffin Joint Lameness.

Can a horse, sprained in the coffin joint of the front foot last march, be cured? Have used liniment and blistered it, but she is not well.—Subscriber, Watsonville.

Coffin joint lameness or navicular disease of long standing cannot be cured, but often lameness of the foot is thought to be one of those diseases when it is really something else that can be cured. Remove the shoes and cut the wall and heels short, as you would when preparing the foot to be shod. Do not cut the frog. Let the horse run barefooted for several months. Soak the foot in cold water once a day and once in two weeks put a light blister just above the hoof. This treatment will allow the heels to spread and has cured many a lame foot.

Paralysis.

Will you kindly advise me what can be done for hogs that are weak in the back legs and unable to stand?—Subscriber, Modesto.

Such conditions often follow when hogs are confined in small quarters and fed heavily. Get them out into the sunshine and give them a field to run in. For medical treatment give them tincture of juniper one pint and salicylate of soda two ounces. Mix and give each hog two teaspoons of the medicine once a day in a little feed.

Eczema.

What can I do for a high-grade Holstein heifer 20 months old that has sore legs. About two months ago we noticed both hind legs looking rough and they felt hard and leathery. Now the left leg is soft and matter and blood ooze out at the hock joint. The hair is matted with blood to the foot. She does not seem very lame, but it seems to pain her a great deal.—Subscriber, X.

Grease the parts well with lard or fried meat fat until the scabs loosen. Then with warm water, soap and a scrub brush clean the parts well. Then once a day apply a lotion made of two ounces of chloride of zinc and one gallon of water. The lotion will do more good if you warm the amount you use before applying it. Do not put the lotion in a metal dish. Warm it in an earthen or granite dish. A handful of epsom salts given internally once a day for a week will change the nature of the blood and aid the healing very much.

PIGEONS AT THE POULTRY SHOW

Pigeon raisers have a treat in store for them when they attend the poultry show at the Auditorium, San Francisco, December 8 to 13. In the fancy exhibit there will be a large showing of the beautiful crested Jacobins, Turbits, Swallows and Archangels, also imported Dragoons, Pouters, Homers, Tumblers, Fantails and Scandaroons.

The utility display will be very strong, as California is getting to eat more and more squabs each year. It is only of late years that the squab raisers went about their business in a scientific way. By the use of high-grade birds they have improved the size of the squab and the quality of the meat. The secretary of the show is E. J. Talbot, Mutual Savings Bank Building, San Francisco.

The State Beekeepers' Association is still endeavoring to put up exhibits for the expositions next year. The former committee's chairman and secretary have resigned. President Ferree is endeavoring to get action so as to put up a good exhibit at both expositions, if possible.

The *Hislop* Orchard Heater

The heater with the radiator that will hold the heat and raise the temperature 10 to 20 degrees rapidly and keep it there. Burns from 24 to 30 hours on one filling. Over 100,000 sold last year. Used and recommended by
Arlington Heights Fruit Co., Riverside.
C. C. Chapman, Fullerton.
Sierra Madre Lamanda Citrus Association, Lamanda Park.
Mutual Orange Distributers, Redlands.
Valentine Peyton, Lordsburg.
T. E. Yerxa, Highlands,
and many other growers all over California.

We are Delivering Hislop Heaters Now

Do not wait until the last minute before advising us as to how many you will need. Write or telephone us for demonstration if you do not know as to the merits of Hislop Heaters. Requires only half as many in your orchard as other heaters—less labor—less cost—less time to light—less smoke—more heat. They are absolutely guaranteed in every way and we want to show you how easily they operate. Cannot blow out and they will **really** heat your grove.

If you will telephone or telegraph us at our expense we will come at once and see you and arrange to deliver what heaters you may need by November 1st. Terms if desired. Full information upon request.

Hislop Orchard Heater Co., Upland, Cal.

References—First National Bank, Upland, Ontario, Pasadena, or to anyone who has purchased our heater, as we have not a single dissatisfied buyer.

The Security Trust and Savings Bank has more than 88,000 depositors.

The Lawn and Flower Garden

THE DAHLIA

Written for the California Cultivator
By Ernest Braunton.

IN all parts of California I notice the dahlia is a great favorite and is found in nearly every garden, both in city and country. At the Fresno District Fair, which I attended as judge of flowers and ornamental plants, the dahlia was especially in evidence, some of the splendid collections coming from a considerable distance, notably one from Pacific Grove. And it must be remembered that these displays were made almost in midsummer, by no means the best season for dahlias.

The reason for writing this article is to make a plea for a wider planting and a more reasonable treatment of this grand garden flower. Do not plant in early summer, or in summer proper at all. If you are situated in what is called a frostless belt and have a spot of really warm exposure, a very early planting will result in flowering the dahlia during the cool weather of early summer. The past season was ideal for this flower, for we have had an exceptionally cool summer.

Store dahlia tubers in a cool, very dry place, preferably dark, buried in deep boxes of perfectly dry sand. After the hottest days have passed plant these in the garden in a rich, loose soil, rather deeply, and water freely. After the tops are growing keep well watered and fed and "on the move" all the time. Stake and tie the tops with care, and in the cool of autumn you will have dahlias that will prove your heart's delight. These flowers are especially adapted to California soils and conditions, being native to nearby territory. A little dahlia history will assist in explaining their fitness for this clime and the necessity for "cool" treatment for autumn blooming.

The dahlia is native of Mexico, through Central America to the northern part of South America, there being about a score of wild species. The nearest relatives are coreopsis and cosmos. In their wild state dahlias grow in partial shade, sometimes in deep canyons or in the edge of forests, at an elevation of one to two thousand feet. Here, while the days are warm, the nights are always quite cool, and wild dahlias under these conditions reach their highest development. Observations of the wild species would suggest their flowering in the garden about October, and if flowered earlier they should receive a slight shading during the hottest weather.

Roses From Cuttings.

Use hardwood from size of lead pencil up to half as large again. Cut with a good sharp knife an eighth inch below a good bud. Use unbranched wood only, with several plump buds on each cutting of six or eight inches. Propagate in a shaded spot protected from wind. A box of pure sand is preferable, yet any soil will do. Make a clear hole in soil with a stick larger than cutting so the latter will not be bruised in forcing into soil. Allow but two buds or eyes to stick above soil (two eyes are enough to see with). Do not have any manure or other fertilizer in the soil. Water heavily and never allow drying out. Leave cuttings for nearly a year without disturbance. Before moving allow them to get dry through lack of water. The nearer dormant, the safer they are to move. Move with bare roots (no soil), but do not allow roots to dry, and water heavily immediately.

The Hardy Loquat.

As the years roll by each one brings to me a larger appreciation of the loquat for ornamental planting, not necessarily budded trees either, but just common seedlings such as spring up in every garden where truant seeds are dropped. In my own yard scores come up each year from seeds thrown away by children when eating the fruits, and I have yet to see a child who dislikes loquats, an additional reason for planting them extensively. It seems to make little difference how much loquats are neglected, they still thrive. In addition to budded trees I have allowed a half dozen seedlings to grow in my yard and find them easy to move at any season or any size. Being a hardy evergreen, and even the poorest growing an edible fruit, they should strongly appeal to all as good fillers for any large premises.

Commercial Floriculture.

No unattached person may so safely enter the field of commercial floriculture as one with present business or employment in ranching or gardening in the country. The latter class have means of feeling the market with comparatively small risk of serious loss, and all experiments and mistakes may be made while the business is on a small scale and in circumstances where some other closely allied business may be depended upon to retrench pecuniary losses. Necessary experience may be cheaply obtained in this way that would otherwise be dearly bought if an inexperienced person were to start raising flowers or ornamental plants to the exclusion of other phases of commercial horticulture. There is no easy road to a successful business along these lines, and the failures are many times the number of successes. In fact, nearly all eventually fail, and life successes are indeed rare.

Plants for Shade.

Just now one of the finest plants for shade is the cineraria, which comes in a great variety of metallic colors, from white to crimson and from white to purple. For general garden planting in shade in almost any range of climate the following old-time plants may be depended upon: Begonias, caladiums, centaureas, coleuses, fuchsias, forget-me-nots, lily of the valley, lobelias, pansies, phloxes and violets.

Cultivate Roses Freely.

Quite recently I was called to look at a bed of rose bushes where the plants were not thriving. I found them growing on a very gentle slope with the center of the bed higher than the sides. The soil had been well broken up but once each year for several years. The rest of the time the weeds had been hoed off. Watering had been done by sprinkling only, and a few inches below the surface where the soil should have been wettest I found it dry. Such treatment will not produce roses or even keep the bushes alive for many years, for it induces many troubles. Irrigate thoroughly by trench or basin, or both. Cultivate frequently after every irrigation, but not deeply. Merely keep the surface three or four inches loose. Roses demand no more, yet I know of no crop that is more benefited by clean culture and frequent superficial stirring of the soil.

New Zealand Veronicas.

A letter from Dr. L. H. Bailey, "on the wing," returning from New Zealand, states he became much interested in the veronicas while in their native land. It is a matter of wonder that more of them are not used in local gardens. Down at the Soldiers' Home near Santa Monica they are planted by hundreds and thrive prodigiously. At a local nursery, in sandy loam, with little water, they are growing in long rows, blooming splendidly, in four or five species. They are lowly herbaceous plants about a foot high, some higher, with fine, glistening evergreen foliage. They flower freely, usually in some shade, from white, through blue to purple, also one or more "bluish pink." All are good.

PRUNING CLIMBING ROSES FOR NEXT SEASON

After the blooming time of climbing roses is over the department's landscape gardener advises that shoots should be pruned, so as to throw the growth of the plant into the new wood that bore no flowers this year, for this is the part of the plant that will bear next year. When a trellis is low (6 or 8 feet high), it is a good plan to cut off the shoots that have borne flowers this year clear to the ground. Climbing roses are a valuable aid in making an attractive home and will repay careful treatment.

Most people in following this advice may feel that they are ruining their bushes to cut them back so severely, but the young shoots that have started about the roots will surprise them by springing up with wonderful rapidity. Each bush will probably put forth several new shoots that will grow as long as those cut, or one shoot will grow much longer. In either case the trellis will soon be covered again. One shoot in a Washington garden last year grew 20 feet after the bush had been cut down in this manner.

In the case of a high trellis a different method must be followed. The renewal of wood must begin from a point higher up instead of from the root, as the growth of a bush is not enough to replace all its top on a high trellis if required to grow so far. Only so much of the old wood should be removed after the flowers have bloomed as will enable the new shoots from the end of the remaining portion of the stalk to replace the old growth. About four feet is a safe measure of the amount that may be taken off.

Those who have grown climbing roses as a screen on their porches, in order to insure a fine bloom the coming year, will do well to follow the advice as given for the higher trellis. In other words, about four feet of the old stalks that have bloomed should be cut off immediately after the blossoms are withered. The foliage will recover within a very short period and continue to screen the porch, and next year an abundant crop of blossoms will be assured.

Economics on the Farm

CAPITALIZING THE FARM

Written for the California Cultivator
By Sacramento Valley Contributor

SEVERAL factors are required in the make-up of any successful enterprise. One of these is a business opportunity; there must be a demand for the finished product, service or whatever it is proposed to market. Another prominent factor is energy and intelligent and careful management. A third and very important factor is sufficient capital to properly carry on the business.

There is no question but that the business opportunity is present on California farms. The demand for food in the world — particularly for California's special food products—is greater than the supply. The problems of marketing may not all be worked out as satisfactorily as they will be in time, but the intelligent grower who is alert and a good salesman, has no trouble in disposing of his product.

And on many, many California farms there is no question about the energy expended or the careful management as far as details are concerned.

But on the average farm, not only in California, but all over the world, there is not sufficient money available to equip, develop and conduct the business as it should be for the maximum results and returns.

In order to be able to do all it should for its owner and for the commonwealth, every practical resource of a farm should be working to the limit of its capacity. For instance, a farm suited to alfalfa growing is not paying the revenue it should if money is not available for leveling and checking the land, sowing alfalfa and handling the crop. If water is to be had for all of it there is waste if a part is dry farmed to grain. Capital sufficient to fully develop the whole place, in addition to that already invested, would raise the percentage of revenue return from the whole property because a part of the expense of handling the place could just as well be applied to a fully developed place as one only partly in cultivation.

Then there are many farms on which alfalfa and other feeds are produced that make only a fraction of the total revenue that they could if there was money available to buy stock to feed it to.

Lack of capital renders the business opportunity of many farms—and the energy and ability of many farmers—far less fruitful of money returns than it could otherwise be.

How is all of this to be remedied?

We believe the answer is that it is being remedied, gradually but surely and steadily, as all changes take place in the great fundamental businesses of the world. There is a feeling of more confidence and interest between bankers and farmers than ever before, and there are farmers who better merit confidence than there were before farmers were better business men. There is progress everywhere; farmers do more figuring and planning and scheming, and as they do this they take the banker more into their confidence. The study of rural credits abroad is helping the whole situation, and every year more and more people are becoming convinced that farming is the best and safest business in the world.

COOPERATION IN THE NETHERLANDS

In the Netherlands there are about 100 cooperative societies for the disposal of fruit and vegetables. Only market gardeners and fruit growers can be members of these societies. The members elect a committee consisting of president, vice-president, secretary and two or four more members. An auction building is erected on a favorably situated piece of land, bought by the committee in the name of the society, and in this building the produce grown by members is sold by the committee, who are assisted by one or more officials, appointed and paid by them.

The sales are by "Dutch auction" and conducted by means of an automatic machine which consists of a big clock-like dial, round the rim of which units of Dutch currency are marked. The merchants or their representatives are seated on raised seats opposite this apparatus. Every seat has a number and communicates electrically with the dial by means of a button. Between these seats and the apparatus is a small canal wide enough to admit the poling through of a barge. Every morning the growers gather the produce ready for market, and after grading, packing and weighing, record the quantity in a book. The produce is then loaded into a barge and a workman poles it to the auction place, where he hands the book into the office. From the moment the auction starts the barges are poled through the small canal between the merchants' seats and the auction apparatus. The auctioneer announces the quantity, and samples are passed among the buyers. The pointer is then released, starting at a figure on the rim of the dial which indicates a higher price than the produce is normally worth. The pointer swings round, indicating lower and lower prices, and when the price that a merchant is prepared to give is reached, he presses the button below his seat, which checks the pointer and indicates the price at which the produce is sold. At the same time his number appears on an indicator, and as at each sale the same seats are allotted to the buyers, the work of recording the purchasers is simplified.

The amount fetched for the produce is then entered in the grower's book, and when the barge is being poled out the book is returned to the grower's representative. On his return the grower can thus see what price his produce has made in the market.

Produce is not sold on a mutual basis, each market gardener receiving exactly the amount realized by his produce, less a certain percentage which is retained by the committee to meet the necessary working expenses, and the growers' accounts are settled weekly. On the other hand previously prevailing evils such as depression of prices by buyers, underweight and bad quality, and bad grading of goods on the part of the growers, no longer occur.

All produce must be paid for before it can be taken from the society's premises, and deposits for any empties must be made to the full extent of their value.

Alongside many of the waterways are sheds erected by the society, for the use of which buyers pay a nominal rent, and in which they pack the produce to be sent to distant markets, including those of Belgium, Germany and England.

The societies in Holland lay down stringent regulations for grading and packing. If before the sale the produce is found to be not up to the standard, the controller refuses to allow it to pass through the auction until it has been regraded or repacked. If after purchase any produce is found to be not of the declared standard, the buyer has the right to refuse it; a defaulting member being fined 20 per cent of the value for which it has been sold; 10 per cent of this goes to the merchant and 10 per cent to the funds of the society.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

TEA GROWING

A daily paper asserts that tea will one day be one of California's principal products. We imagine this paper will have opportunity to revise its estimate of the worth of this crop, for we do not think labor conditions in this country will permit the establishing of any such industry. However, it is interesting to read these stories of enterprising reporters.

RAILROAD FINES,

The office of information of the department of agriculture reports fines to the extent of $25,000 collected from railroads because of violating the 28-hour law which prohibits continuous confinement of cattle for more than 28 hours without unloading, feed, water and rest. In the list of railroads fined we are glad to see that with the exception of the Northern Pacific no Pacific coast railroads were fined.

THE CITRUS STATION

It was fully expected that the matter of location of the Southern California citrus experiment station would be decided at the recent meeting of the board of regents of the state university. No decision was made, however, and from present indications there is no hope of immediate decision. This is unfortunate, for there are questions to be decided which cannot be taken up at all until the station gets down to work in its permanent home. We hope that when the decision is reached it will be right.

PHOTO CONTEST.

This is the last week of the contest for photos which will be used in the issue of November 5. Send in photographs of California farm life. Two dollars will be paid for the best, $1.00 for the second best, and six months' subscription for all others retained for future use.

It has often been the case that some member of a subscriber's family has entered this contest and not sent word as to whose name is desired to be entered on the list in case the photo is retained. Would ask all who are contesting to bear this in mind.

STATE FRUIT GROWERS

Another week the Cultivator will give liberal extracts from the program of the 45th State Fruit Growers' Convention which will be held in Los Angeles, November 10-14. The committee on arrangements has plans nearly completed and an excellent room on a quiet street assures fullest enjoyment of all the discussions. One of the most attractive features of the convention will be the sessions for women which will be held in the parlors of the Hotel Clark Miss Lilian Clark of the state university will have charge.

A fare of one and a third is assured on all railroads. Every purchaser of a ticket to Los Angeles should ask for receipt which, after endorsement by the secretary of the convention, will entitle holder to one-third fare on the return trip.

Arrangements are being made by which the proceedings will be published in book form, but the only way to get the fullest advantage of these conventions is to be present and engage in the discussions.

TURKESTAN

The department of agriculture has issued a bulletin regarding the inferiority of much of the commercial Turkestan seed which has been offered to the American market. After making comparative tests of different kinds of alfalfa seeds the conclusion is that there is nothing to recommend the Turkestan variety for general use in this country. Particularly is it undesirable in a damp climate. We think California growers have found the same trouble, for one specimen of the plant was brought to this office from a field which had lost its entire crop because of rust or leafspot. It seems to be seriously affected in a damp or cool season such as the present has been. If such is the case it is wise for alfalfa planters to insist upon having the old time, or Chilean variety, at least until more conclusive proof has been given of the adaptability of the Turkestan, Arabian and others to different conditions.

BY-PRODUCTS COMMITTEE

The fruit growers of Oregon have a committee that has been investigating as to saving some of the wastes of the fruit industry, particularly of apples of the Northwest. The committee has reported in favor of every effort being made to save these millions of dollars' worth of wastes through development of home markets and the placing of these by-products on the market in as attractive form as possible. The Northwest estimates its on-coming acreage as sufficient to ultimately produce at least 150,000 carloads of apples. This enormous output will require many hungry mouths to consume. On the other hand reference by the committee is made to the importation of canned and evaporated fruits, and it urges to greater activity every effort to claim this market instead of giving it over to the importers.

NURSERYMEN'S CONVENTION.

The California Association of Nurserymen held its fourth annual convention in San Diego last week.

The officers elected for the coming year are: F. H. Howard, president; John Vallance, T. E. Mabee, L. M. Wheeler, Thomas Jacobs, John Morley, vice presidents; H. W. Kruckeberg, secretary-treasurer; and executive committee consisting of W. V. Eberly, J. D. Meriwether and F. H. Wilson. The nominating committee recommended San Jose as the next place of meeting, but owing to the possibility of the convention uniting with that of the Pacific Coast Association the matter was referred to the executive committee with power to work in harmony with that association.

Because of space taken by reports of the dairy and creamery conventions at Modesto we are unable to give a report of the nurserymen's meeting until next week. The Cultivator's little camera was busy, and the principal part of next week's report will consist of little photographic notes of the personal side of the convention.

RURAL CALIFORNIAN.

Occasionally some subscriber of the Rural Californian who failed to observe the notice of consolidation with the California Cultivator writes to ask what has become of his old time favorite. The subscriptions to the Rural Californian have been put upon the Cultivator subscription list, or those who are subscribers to both have had their Cultivator subscriptions extended according to the credit still remaining on the books of the Rural Californian. As a rule this change has been entirely satisfactory to the subscribers of the Rural, for the reason that the Cultivator makes its visits four of five times every month instead of once as did the Rural. We trust the old Rural subscribers have noticed that we are also bringing in many of the features which were so attractive to the Rural readers. The most successful features which have been thus transferred are the contests of photographs and other features of interest to the homemaker. The next contest will be of photos, all of which should be in this office by the morning of Thursday, October 29.

LITTLE KINGDOM OF KINGS

The "Little Kingdom of Kings," which is the poetical way of describing Kings County, of which Hanford is the center, brought its products to display at its annual agricultural fair last week. It is estimated that over 20,000 people visited it. And be sure it was a for-sure agricultural fair, for Hanford is in the center of one of the richest producing sections of California. Live stock is perhaps her greatest industry, unless it is crowded somewhat by her fruits, but both these productions appeared at their best at the fair, and with her productions of great value to Kings County and all the state, there was much of pleasure.

The pavilion was the center of attraction. Displayed there were nearly all kinds of products of the soil, of course all kinds of fruits, dried, cured and fresh. The garden and the grain field sent of their products to compete with the ever-present big pumpkins. "Made in Kings County" was the legend over one of the most attractive booths and in it was a great showing of many manufactured products, and all from within the county lines. Agricultural clubs made attractive displays which aided in proving the worth of these organizations. As of old, the race track was the most attractive feature, and there were some good clean races which were richly enjoyed by the large crowd almost continually in the grandstand.

Agricultural News Notes

The trip from San Francisco to ports on the Atlantic seaboard is now made in from 20 to 24 days through the Panama canal.

County Agent Calnan of Barnes County, North Dakota, has organized the only dairy test association in that state. He has 16 herds under test.

Total receipts from all national forests throughout the country last year amounted to nearly two and a half millions of dollars, the exact figures being $2,437,710.21.

Thanksgiving week, November 24-29, is the time of Missouri's state poultry show. It will be held at Mountain Grove at the famous poultry experiment station of Missouri.

Potato growers of Wisconsin will hold their third annual conference at Grand Rapids, November 18-20. Standardization of the potato crop will be the main subject of discussion.

To establish a fixed weight or measurement on every species of fruit and vegetable boxing officials of Cuban railways are conferring with fruit growers of the Isle of Pines. This to accommodate both transportation companies and growers.

The supreme court of Pennsylvania has decided that the amount of damage collectible on growing timber set on fire through negligence is not only the value of the wood destroyed, but also the injury to the property as a whole through the destruction of the young growth.

Wisconsin has a farmers' seed growers' association known as the "Wisconsin Experiment Association," which conducts experiments on a large scale. As one instance we mention the fact that for five years 1020 members experimented with barley and 1500 members with maize.

California now ranks fifth among all the states in volume of postal savings deposits. According to a postoffice department statement there is now $3,074,347 postal savings funds on deposit in California postoffices. New York, Pennsylvania, Ohio and Illinois are the only states with larger deposits.

It is feared that New York City's free markets may be closed by cold weather. Their operation, brief though it has been, has proved most helpful. One suggestion which has been made in that the recreation piers of the city be utilized. Since these piers are covered, they could at no great additional expense be heated. An indication of the popularity of these markets is the statement of a dealer in market bags and baskets that he sold 571 of these receptacles at the market in a single day.

In this year's appropriation to the department of agriculture, congress made a clear separation of the research work of the office of farm management from the demonstration work. As a result the demonstration work has been organized into a unit distinct from the office of farm management and entitled "Farmers Cooperative Demonstrations, Northern and Western States." This new unit or office inherits all of the county agricultural agent work and all of the boys and girls' club work heretofore carried out by the section of field studies and demonstrations of the office of farm management, and in addition has taken on a third line of extension work which it designates as demonstrations in the business of farming or farm management.

Agricultural News Notes of the Pacific Coast

Northern California

The bean crop of the Sutter basin is reported the best on record.

Oroville, Butte County, has already shipped its first car of oranges.

Butte County is to have a new rice mill located either at Gridley or Biggs.

Fifty tons of honey, it is estimated, will be shipped from Chico, Butte County, this season.

It has been decided to reopen the Alvarado sugar factory in Alameda County for next season's crop.

A tract of 1400 acres in Yolo County has been taken over by a company which will grow rice upon it.

The Davis unit of the Yolo County farm bureau met October 14 to make plans for the winter's activities.

The Santa Clara Canning Company has been awarded a government contract for 10,000 cases of tomatoes.

A farm center of the proposed county farm bureau for Mendocino County was last week organized at Willits.

The fourth annual convention of the Southern California Association of Nurserymen is now being held in San Diego.

Picking of green olives will begin about the middle of November in the section about Red Bluff, Tehama County.

The Sacramento Poultry Association is mailing premium lists for its show to be held in Sacramento November 2-7.

The California State Dairy Association has called upon all dairy interests of the state to assist in the fight against the eight-hour bill.

The farmers' short courses at the university farm opened the fifth of the month with an enrollment more than double that of last year.

The agricultural club of Placerville, Eldorado County, held its first meeting of the season Saturday, October 10. Practically the entire program was devoted to the potato.

Dairymen of Humboldt County recently held a largely attended meeting at Ferndale, at which arrangements were made to carry on a campaign against the proposed eight-hour law.

The Esparto unit of the Yolo County farm bureau held an institute last Thursday and Friday. The first day was given entirely to addresses and discussion of stock feeds and management.

Horticultural Commissioner Mills of Butte County reports that during the past year over a quarter of a million nursery trees were inspected at the several depots throughout the county. He also reports that the most serious pest in the orchard this year is the red spider.

Yolo County's cow testing association has been organized something over four months and has proved of inestimable value in detecting unprofitable cows. The highest producing milker is a Holstein which produced 223.5 pounds of butterfat during the four months' period. The average cost of keeping a cow in this section is estimated at five dollars.

Central California

Dinuba is now shipping out Emperor grapes packed in drums with sawdust.

A carload of pomegranates was shipped from Lindsay, Tulare County October 1.

The Stanislaus County Poultry and Pet Stock Association is arranging for its show in December at Modesto.

The Visalia Cooperative Poultry Association is continuing the fight against importation of Chinese eggs.

A number of large shipments of honey have been made from Kerman, Fresno County, within the last week.

The mountain section of Madera County is planning an apple show to be held during the latter part of November.

Large shipments of raisins are being made from the San Joaquin Valley to eastern points by way of the Panama Canal.

There is a movement on foot to secure signatures of orange packers of Tulare County to a mutual compact to ship no immature fruit.

The output of cured figs from the San Joaquin Valley this year is estimated at between 6000 and 7000 tons as against 4500 tons last year.

Riverbank, Stanislaus County, has organized a farm center of the county farm bureau which must be organized before appointment of a farm adviser will be made.

The San Joaquin County farm bureau has decided to secure selected alfalfa seed for its members. Farm Adviser Frank E. Lyon will visit Tracy October 26, Holt October 28 and Waterloo October 30.

The pink bean growers of Soledad and Greenfield are now threshing and hauling their beans to the warehouse. The beans are of excellent quality and bringing a good price, three and one-half cents per pound.

The Tulare County Board of Trade is arranging for Tulare County's citrus exhibits at the Panama-Pacific and Panama-California expositions. One feature recently suggested is the use of kumquats for decoration.

The Tulare County Fruit Growers Association expects to pack about 125 tons of olives this season. This year the cannery will handle only ripe olives and will pack only in tins. The bottle pack will be discontinued.

Various sections of Stanislaus County are now organizing units of the farm bureau preliminary to appointment of a county farm adviser. The board of supervisors has already made an appropriation for expenses of the office.

The Tulare County Citrus Fruit Exchange has received information from Washington that the federal authorities have completed their work on determining orange standards and that the new regulations will very soon be published.

The report of Secretary Thompson of the Tulare Cow Testing Association shows a substantial gain made the past year in the production of butterfat per cow in herds belonging to members of the association. This cow testing association has been in operation for three years.

Southern California

A walnut thief at Anaheim was given six months.

The Blythe cotton gin is busy at work on this season's picking.

A chrysanthemum show is to be held at Azusa the last day of October.

A shipment of 15 tons of honey was made from Heber, Imperial County, last week.

Beaumont will hold its annual flower and apple show, Tuesday, November 3.

Date growers of the Imperial Valley will meet at the Valley experiment farm Friday, October 23.

Fifteen thousand rose plants will be set along the good roads of Los Angeles County during the coming winter.

There has been some trouble between Imperial County's board of supervisors and its horticultural commissioner.

Many honey producers are storing their honey, hoping that the European war will soon be settled and the market improved.

Bee men of the Antelope Valley, in Los Angeles County, are expecting a big crop. It will probably amount to over 100 tons.

Bruce Boyer has been appointed horticultural inspector for the Coachella Valley in place of Mr. Cawthorn, resigned.

The lima bean contest of Ventura County will be held November 7 at Ventura. This is a contest of school children of the county.

The big break in the levee, near Blythe, Riverside County, which occurred during the high water this summer, is being closed by the water company.

A Pomona fruit cannery has just disposed of 48 tons of apricot pits at $40 per ton. The kernels will be shipped to Germany for manufacture of prussic acid.

Cotton growers of Blythe, Riverside County, have formed an association to build a cotton warehouse so that they may hold their crop for better prices.

A $100,000 pre-cooling plant is about to be erected at Claremont. It is to have a capacity for handling 600 carloads of oranges and it is planned to have it ready about March 1.

The farmers' union of Arroyo Grande, San Luis Obispo County, reports the addition of 17 new members at its last meeting. It is now discussing with a commission house in Los Angeles the erection of a fruit and vegetable cannery.

Eight hundred acres in Orange County is planted to celery this season. Five hundred and fifty of this will be handled by the Orange County Celery Growers Association, which is a cooperative organization selling through the California Vegetable Union. Orange County in former years has had as much as 3000 acres planted to celery, but much of this acreage has gone to sugar beets which are contracted before planting whereas the celery takes its chances on the market.

The Coast

October 20 was apple day.

Colorado is finding some difficulty with foul brood in apiaries.

The beet sugar factory at Idaho Falls, Idaho, expects to handle about 80,000 tons of beets this season.

The 1914 fair at Willcox, Arizona, is to be held the last three days of this month. All Cochise County is boosting for it.

The live stock show at the Oregon state fair is claimed to be the finest ever. The hog and sheep shows were particularly good.

Owing to lack of funds, horticultural inspectors of eastern Washington will be compelled to discontinue part of their blight inspection work.

Government engineers have been inspecting the Palouse irrigation district in eastern Washington preliminary to renewed activity on the project.

Chicago receivers of apples shipped from the northwest are urging growers to keep at home all the rough skinned apples and ship only the very best.

The Oregon agricultural college at Corvallis is to establish a market bureau which will cooperate directly with any group of farmers in the state who wish its assistance.

In connection with the "Buy a Box of Apples" movement throughout Idaho, Oregon, Washington and Montana, it is suggested that the last week of October be named as Apple Week.

Lectures on home economics will be given at the University of Arizona at Phoenix on January 4, 5, 6. The agricultural extension service of the university will send particulars to all interested.

The annual agricultural demonstration train conducted by the railroads of Arizona and the state university will start from Phoenix November 18. The schedule of visits will be announced shortly.

At the recent meeting of the Spokane County Farmers' Union resolutions were adopted commending the successful work of the newly appointed county agriculturist and opposing the eight-hour bill.

At the request of potato growers in Idaho the secretary of agriculture is giving especial attention to the application of the net weight law to potatoes in sacks, with reference to shrinkage of weight during long shipments.

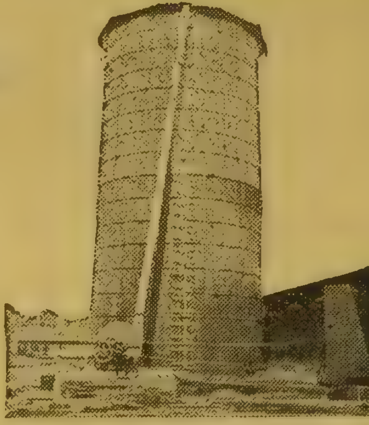
Pomologist Ramsay, in charge of fruit transportation and storage experiments for the bureau of plant industry, is strongly advising apple growers to pre-cool their fruit, stating that cold storage deadens the susceptibility of the fruit cells to bruises, as well as retarding ripening.

Conferences between cattlemen and forest supervisors are being held at Arivaca and Patagonia, Arizona, the purpose being to allot certain definite areas to each permittee, or group of permittees. By constantly returning the cattle to the range allotted them and by the use of drift fences, it is hoped they will gradually be educated to keep close to their own range.

SILOS

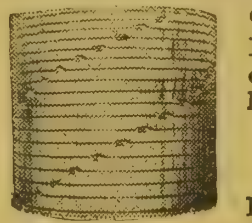
All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.



TANKS

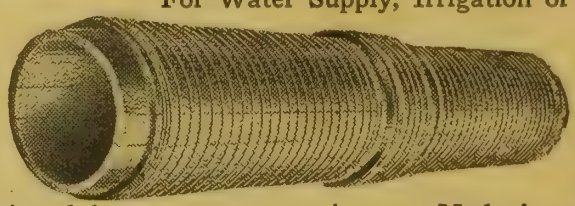
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Redwood Manufacturers Co.

STANDARDS FOR CALIFORNIA DAIRY PRODUCTS

By L. M. Davis

Before State Dairy Convention at Modesto

HANDLING dairy products, the one goal toward which we all strive and which determines perhaps more than anything else our ultimate success is the matter of quality. Quality is the basis of our industry. It is the all controlling factor which, if attained, brings prosperity to the dairyman and creamery owner and joy and happiness to the buttermaker. On every hand, no matter what product may be concerned, it is quality we hear exploited, and certainly the value of quality is no less in dairy products than in other food products. Recognition of quality is what has developed the certified milk business and what has made the large ice cream dealers feel justified in the expense of installing modern sanitary factories. Were quality of secondary importance, we could not buy butter and cheese which is pleasant to the taste and good for the body.

When we concede these facts, it causes one to wonder all the more why such a small percentage of the butter and cheese received in our large wholesale markets will pass under the highest grade requirements. Why is it that we find so many creameries and such an abnormally large percent of our dairymen catering to an apparent second class trade! The large number of prosecutions pushed by the state dairy bureau is evidence that there is much slackness in dairy production. Not only experience, however, but facts as well, show us that the most will be realized from the dairy and creamery business when we are able to market goods of quality, and this reason is the one which challenges every person interested in the dairy industry to do his share in production of quality. It is a natural condition that we follow the path of least resistance, but in the dairy business this is almost certain to bring failure. If we succeed we must keep guiding standards in mind, and these standards must keep up with the righteous advance of civilization.

The main question which seems to concern many of our manufacturers is one of increasing their supply, but their real problem lies in improving the supply which is already theirs. A concentrated effort on the part of every manufacturer or handler of dairy products would accomplish untold results in raising the present quality of California dairy products. The grading of butter and cheese on the market is an attempt to improve our products and represents to my mind the only fair principle of buying and selling. Under the present system of grading on the San Francisco Market, for example, the impossible is not asked of the producer of cream and the manufacturer of butter. They are called upon to furnish butter of clean, fresh flavor, well made and packed. The standard for fancy cheese calls for a clean flavored product and one which is well made and of good appearance. For these high grade products the manufacturer was offered during the month of September an average premium over the next grade of two and one-half cents for both butter and cheese, ranging from one-half cent to four and one-half cents for butter, and from two cents to three cents for cheese. Under ideal market conditions a very liberal premium exists for first class products, and his premium is a recognition of quality, for it is no more fair for a creamery manufacturing butter which will score 86 to obtain the same price which 94 butter brings than it is for the prospective buyer of dairy cows to demand a Teake Lyone or a Riverside Sadie De Kol price for a scrub. In either case, the poor butter or the poor cow, there is represented an economic waste which some one must lose on.

The establishing of market grades was not only an advisable move, but a necessary one. From the standpoint of the consumer and the butter dealer it was a necessity in order that an effective incentive be offered for those goods which the best markets demand. Market grades have practically eliminated the lower quality butter in California markets, until now it is seldom that any such sales are reported, most of the butter grading probably as firsts or prime firsts. The establishment of grades was fair to the manufacturer, too, in that it offered to him a price which was determined by the quality of his product. As a matter of justice to those factories which turn out A 1 butter or cheese market grading has proven a fair method of dealing, through the discrimination made against poor goods. The man who argues most against the use of standards where they are properly and justly enforced in found in many cases to be the man who consistently supplies the market with a low grade product, and behind his argument is the weak plea of wanting the best in return for the poorest, of asking much and giving little.

In the remarks which follow I shall have in mind particularly creamery butter. What is said of this product is true in a way of others as well, especially cheese. Milk and ice cream do present a slightly different aspect, for they are products for which there is to a certain extent no market unless quality in production has been exercised. There is to be found much milk and ice cream of second grade, but probably not to extent which we find butter and cheese.

Anyone who has made a study of our butter markets is readily aware of the fact that a small percentage only of the butter received on the markets is strictly first grade. Market scorings substantiate this statement. The butter score card is the best and practically the only means we have of arriving at the market condition of butter, and it is a safe conclusion that less than 10 per cent of the butter manufactured by creameries will grade extras on a strict scoring. It is true that in using the score card personal likes and dislikes may influence a judge, still in observing the work of the educational butter scoring contest, conducted by the University farm at Davis, during the past five years, as well as the routine scoring of butter on the market, which work has involved roughly the detailed scoring of perhaps a thousand samples, I am convinced that in 99 cases out of 100 a score conscientiously placed by a butter judge will be a fair representation of what the butter is really worth. My experience, however, does not show me that such a statement would be generally accepted by all creamerymen. Some creamerymen get very unreasonable when their butter scores less than 92 or 93 points. My poor ability at scoring butter has been pointed out to my superiors. I have been called up by long distance telephone to listen to profane language and have received telegrams bearing evidence of having been hastily sent from creamerymen, telling me that the person who would score the butter sent by them less than 94 points knew nothing about butter or anything else, no matter whether such person happened to be a federal dairyman, an official market butter inspector or what not. At the recent state fair one buttermaker became very much perturbed and wrathy over the fact that his butter scored only 91, and complimented the judges somewhat in the manner above mentioned, in spite of the fact that he churns only cream which is shipped and in a plant which is far from being an ideal place to handle any food product. As a matter of fact another buttermaker who overheard this man's emphatic denunciation of the butter scoring stated afterward that he failed to see how good butter could be made in such a factory as the one in question if the buttermaker were given the best grade of sweet cream to work with. It is extremely unfortunate when a person reaches that stage of advancement which rebels openly at unfavorable criticism. Our sympathy goes out for the poor fellow who actually believes that he has reached the point where his performances can not be marred by such disagreeable things. One thing is impossible—"A man can never push himself forward by patting himself on the back."

In justice to some buttermakers whose product is below par, but who insist that it is of highest grade, it is only right to mention what I consider one of the causes of poor quality and which has challenged the fairness of California market standards. I refer to paying highest prices for undergrade goods, a practice which we know exists at certain times of the year at least. One of the arguments put up by a creameryman who objected strenuously to the score given his contest butter was that he had been getting top market quotations right along, although his contest butter had consistently scored not higher than 91. Some one was wrong, either the butter judge who scored the contest butter or the commission man who scored the market butter. If butter will score only 91 under the market standard it is unfair to the creamery business in general that the price of 93 point butter be offered for it. This matter of competition, and, too, that of supply and demand enters in, but I am certain that were the butter markets to grade more closely, a more determined effort would be made by the creameries to improve their product.

In the great struggle for existence which the creameries of California have and are experiencing, quality has suffered. Who is to blame? The whole proposition hinges upon what has just been said, for it is apparent that were butter paid for according to its quality some creameries would have to do a vast amount of improvement or they would succumb. This then is one of our problems. Competition in the creamery business itself is also to blame. We have found that when the question of improving the cream supply is taken up with some creamery patrons they immediately quit sending their cream to us. Some other creamery gets it, and our acquaintance with such dairymen leads us to believe that whoever gets their cream receives it in no better condition than we did. There are creameries in existence which cater to this class of dairymen. They stand ready and willing to take anything at all times. They have as a rule a wonderful buttermaker who is able to take cream which is delivered once every week and testing 0.6 per cent acidity and handle it in such a way that the butter therefrom is purity personified. We can find such creameries advertising their product under glowing terms, and the worst of it all is that some people believe it and decide if such butter is perfect they will go without or take oleo. There should be some regulation whereby a creamery, not only the building, but the buttermaker as well, should attain a certain standard or should be prohibited from advertising his creamery's product for more than it really is.

Dairymen themselves are partly to blame. Recently a state dairy inspector stated that anybody could start a cream station in a certain California town and make money for about a week, then his business would stop. The dairymen in that vicinity are continually looking around for a new buyer. They have no interest in any creamery. They have no interest in producing a good grade of cream. All they have any desire to produce is butterfat, and it sometimes seems that our creameries assume this attitude also. There is no doubt but that we all want butterfat, and further that we all want good flavored butterfat, but too many are afraid to emphasize the latter. There is nothing truer than this, that the successful production of good dairy products and the maintainence of our standards means and requires cooperation from producer to consumer. The lack of cooperation is one thing which is helping to break down our standards.

The consumer, upon whom the butter dealer, the creameries and the dairymen are actually depending, is becoming more and more active in dictating to the dairy interests under what conditions they may operate their business. Ignoring the efforts of those tireless workers who have no business of their own to attend to and who have to tend to that of other people, there is some reason perhaps for this spirit of unrest. Do you blame the man who pays half a dollar for a pound of butter for wanting good butter, or the housewife who pays ten to twelve cents per quart for milk for wanting good milk? The consumer can rightly lay claim to his money's worth. On the other hand, however, he must be willing to help pay to keep up the standards. It costs money to produce the best grades of milk or butter, and certainly the person who must pay this premium is the consumer. It is a matter of some interest that there is such a general sentiment against an increased price for dairy products. People will accept an increased price for most any other food product with apparently less complaint. If the producer cannot obtain the price which is necessary for a high grade product, we have admitted another factor which tends to spoil our standards. The consumer frequently argues that present prices are such that the producer is realizing a reasonable profit, for which reason he does not feel justified in consenting to an increase in retail prices, and that if producers will not raise their standards he will resort to legislation to bring about the improvement he seeks. Let us hope that a condition like unto this will not be realized, but let the possibility of its existence prompt the dairymen and creamerymen to action in bringing into effect those methods which the production of any food product deserves. Careless practice on the part of dairymen is bound to favor the adoption of burdensome regulations. Dairy inspectors nowadays are too unwelcome on most dairies. They should be regarded not as policemen, but as advisors. Even were those dairymen who have been or who ought to be prosecuted under the dairy law to follow their own convictions, I venture that the life of the California dairy inspector would be more pleasant. So long as the dairy inspector has to spend some of his time in court, the standards of our dairy products are in danger.

That California standards are imperiled is illustrated by the recent action of the Los Angeles Exchange, where the requirements for highest grade were lowered. To the outsider this is an indication of a step backward. Shall we admit defeat in our effort to make California one of the leading dairy states of the Union? We must have quantity, but along with this let there be quality, that factor which will do most to make for California's dairy industry the same enviable name which her fruit industry boasts. We cannot expect this until we individually assume our responsibilities, maintain a lasting interest in our products, and at least approach some degree of cooperation. Nothing can be more ruinous to our industry than the manufacture and marketing of low grade products. It is the fancy goods which bring the fancy price and create profitable lines of trade.

MODESTO DAIRY SHOW

(Continued from Page 387.)

quality, for it affects the producer seriously in his pocketbook.

Cooperation

It is gratifying to note how strongly the idea and the spirit of cooperation are getting hold of dairying and dairymen. A decade or two ago the cooperative creamery spread over the state; many plants were erected—by promoters chiefly—and many failed because they were badly located or badly organized. Then the pendulum swung toward the private creamery and to the big centralized concern. But now the cooperative idea has been worked out on a sane and sound basis, and has so well succeeded in a few instances as to serve as an excellent object lesson for all dairy localities. An important phase of the situation is that a group of cooperative creameries combine to have their own selling agent in their chief market city. Thus a group of cooperative creameries in southern San Joaquin valley have a selling agent in Los Angeles. A group consisting of a new creamery at Ferndale, a new one at Petaluma and one

The Leader of Them All

in course of erection at Point Reyes, have a selling agent in San Francisco. Thus the man who owns the cow has his finger on his product until it passes into the hand of the retailer, who stands next to the consumer. Surely it is a wise and righteous condition.

Exhibits

Modesto has set the pace, and when these conventions meet again in a dairy center, we will expect to see an effort to excel the 1914 exhibit. But any locality must go some to beat a Modesto dairy cow show, even though pavilion exhibits may be increased. A notable display in the auditorium is by the United States postoffice of the parcel post facilities. The exhibit was arranged by Wade H. Howell, postmaster of Modesto, and is a part of the general movement of the United States postal department to acquaint the public with how to use the mails for shipping. Some 200 different packages or containers were shown, as well as articles that may be sent by mail. These include silk dresses, auto tires, fresh and dried fruit, butter, cheese milk cans, vegetables, figs, medicine in glass bottles, bundles of lath, small trunks, etc., etc. An educative feature was in the container showing the right and wrong way of doing up packages.

The greatest interest was shown in the dairy cow exhibit, where about 70 head of registered cattle were shown, mainly by Modesto breeders. State prize winners were there, for Modesto has long been carrying away honors from Sacramento. The exhibitors were:

Jerseys—Guy H. Miller, Fred B. Wulff, J. M. Bomberger, Rancho Dos Rios, D. F. Conant, C. D. Haworth, T. W. Cheney, W. W. Fish.

Holsteins—J W. Bensit, H. B. Cowan, H. E. Cornwell, Luther Thompson, G. W. Barber, Arthur Kendall, Mr. Palander.

Dutch Belted—U. G. Strader.

The awards of the judge, Professor True, came too late to incorporate in this week's account, but will appear next week.

A Jersey Sale

As a sort of prelude to the convention and dairy show was the sale of W. W. Fish of Davis, Yolo County. Mr. Fish not long ago bought several good animals in the east to stock his ranch at Davis, but he was obliged to change his plans and placed his cattle at auction. The sale was a good one, as the appended list shows:

To J. B. Fakes, Rosette, Anna K., Noble's Nugget, Noble's Princess, Lillian, Louisa Hugo, calf (heifer), Teddy's Ruby, Noble's Warder. To J. De La Meter, Fox s Chata, Jolly's Teddy Pogis. To P. M. Lansdale, Lucy Queen, Kate Cheatham. To S. F. Williams, G. Lucy (calf). To J. M. Bomberger, Noble's G. Laddie. To D. F. Conant, Dinah, Hazel, Lady Turbigo. To F. L. Weston, Dinah's Norah, Lois, Louisa Ruby J, Helen's Pink. To R. E. Watson, bull calf. To Fred B. Wulff, two heifer calves. To O. C. Blessing, Pansy, Noble's Paula. To H. D. Coolidge, Paul Warder. To J. E. Lewis, Paula's G. Maid. To M. E. Kerr, Helen of Valley View. To M. L. Garber, bull calf.

FEEDERS

The Cultivator has had several requests for information as to where feeders could be purchased, to be brought to California and fed upon our surplus alfalfa. We have written to Mr. M. E. Bemis, editor of the Southwestern Stockman & Farmer, at Phoenix, who replies:

"Cattle are being shipped out right along now. About 1000 cars will be shipped from two points, one in the northern and one in the southern part of the state, during the present month, so I am informed. It is my impression that a buyer should be on the ground to buy to good advantage. Most buyers make contracts for future delivery some time in advance of the rodeo. I am of the opinion that most of the cattle for fall delivery have already been contracted."

In addition, Mr. Bemis sends us a list of live stock inspectors of Arizona, copy of which will be mailed to any subscriber of the Cultivator who may request it. Doubtless these inspectors are in close touch with live stock conditions in that state.

THE GUERNSEY BREEDERS' ROUND-UP

Thursday, October 29, is the day set as Guernsey Day at the National Dairy Show at Chicago.

The Guernseys will be judged in show ring during the day, and all breeders should make an effort to be there.

In the evening will be held the Guernsey breeders' banquet and general meeting.

The importance of the National Dairy Show has been growing and each year marks more forcibly its usefulness in the advancement of the dairy industry.

WM. H. CALDWELL,
Sec'y. Am. Guernsey Cattle Club.

Poultry for Profit

WHY PURE BREDS?

Written for the California Cultivator
By Jean A. Koethen.

THE young man who delivers my groceries stopped on the back step the other day to ask if I had a Buff Orpington cockerel for sale. Further conversation developed the fact that he had no Orpington hens, but was thinking of mating the Orpington to some Rhode Island Red hens he happened to have. "Why don't you get a Rhode Island Red cockerel?" I asked, and he had no reason to give save that he "liked Orpingtons better."

That is exactly the attitude of many people who "keep chickens." Some one recommends Rhode Island Reds, and they at once try a setting of Red eggs. Another neighbor says there's nothing so good as White Rocks, and forthwith some White Rock chicks are bought or hatched and turned out with the Reds. An opportunity comes to buy a few Leghorn hens cheap, and our friend, who always has liked Leghorns, mixes them with his Red-Rock aggregation.

The situation would not be so bad if the breeds were kept separate, and all of one breed, but the chances are, on such a farm, that the best cockerel is mated to all the hens, regardless. Indeed, I have seen cocks of two different breeds running with as many breeds of hens, and all different. From such breeding as that you get "just chickens and such chickens."

The reasons against this practice have been given so many times and in so many places that it seems childish to mention them, but I am going to try just this once to sum them all up.

My first reason for preferring pure bred fowls is one that most people would put last, but I consider it a very good one. It is the aesthetic reason, just "looks." A pure bred flock, be it Leghorns, Orpingtons, Barred Rocks, or any other breed, is a beautiful sight, a sight to make any passer who cares at all for chickens look and look again. It is a pleasure to care for such a flock, and a pleasure to hear them praised.

Beauty is its own excuse for being. That's a truism. It is also the plain, unvarnished truth. It is said, I don't know how truly, that one reason so many young people leave the farm is that they want beauty—pretty green yards, attractive homes, and all the rest. Perhaps a flock of beautiful pure bred fowls, well housed in shady runs would not add much to the sum of beauty on our farms, but it would add something, and give pleasure to the whole family.

A flock of mongrels on the other hand is not beautiful, nor is it even interesting. There is no chance for breeding up, no possibility of producing one fine fowl of any breed. They are "just chickens," that's all.

My second reason is one that will appeal to every one. Scrubs are not as profitable as pure bred fowls. Professor H. C. Pierce, of the United States department of agriculture, says:

"I am pretty well acquainted with the poultry conditions in the country, particularly in the southern states, and I do not know of a single instance where a man has made a success of the poultry business to any great degree where he has used common stuff or mongrels. I would just as soon go bear hunting with a bird dog as to go into the poultry business with common, mongrel stock.

"In addition to furnishing produce for a Baltimore house, we were on one occasion furnishing fresh eggs daily, receiving ten cents above the market price, but the demand grew so great during the hatching season that we were compelled to put in some common eggs to help supply this egg trade, but we found a very small per cent of the eggs from common fowls were fit to sell as first class eggs. We did not get the same value for our feed. There is no mongrel, or common, chicken that will compare with egg-producing breeds, because these breeds have been bred for centuries for egg production, and you can get more dozens of eggs from them."

At the Cornell experiment station experiments were made in crossing White Leghorns with Barred Rocks, and it was found that the offspring, while they were larger than Leghorns, were smaller than Rocks, and not so good as either. Professor Rice says:

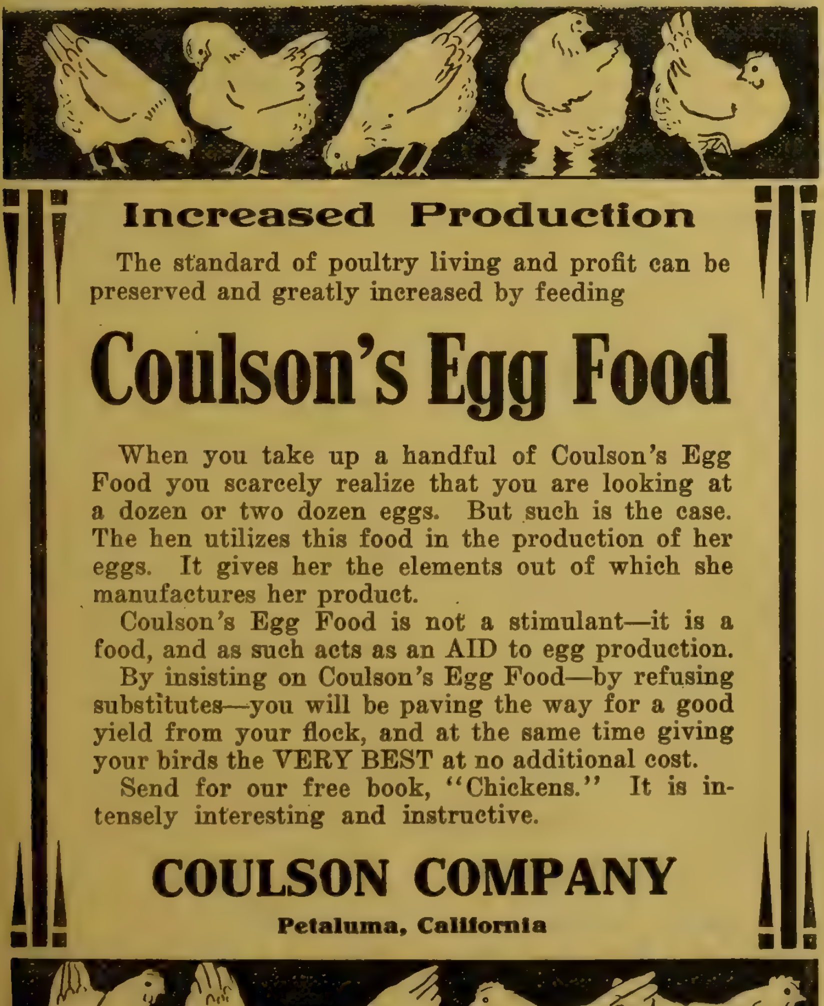
"We gained nothing in constitutional vigor, egg production or meat production over the pure breds, but we did do this, namely, by bringing together two magnificent pure bred varieties which have taken somebody from fifty and sixty years to develop, we have in one season undone the careful breeding of half a century. Just what would take place in a cross of fowls that are more closely related in type, such as the Plymouth Rock and Rhode Island Red or Wyandotte, yet remains to be seen, but I think we are hewing pretty close to the line when we use only pure breds to get uniformity in type of fowl and quality of eggs, hatching quality, feeding quality and beauty in appearance."

An experiment of my own this spring in crossing a Buttercup male with Buff Orpington females had similar results. The offspring grew more rapidly than the Buttercup chicks in the same brood, but less rapidly than pure bred Orpingtons, and it is hard to see what gain there could be from such crossing, unless it were in egg production, and I have no chance to test that as yet.

The worst result of crossing lies in what follows in the second hybrid generation. The first generation may be fairly uniform and have some good qualities, but the second "goes to pieces" and you get everything and anything. Gregory Mendel, the Augustin monk, whose discoveries, based on many years' experiments with the common garden pea, have made an epoch in the study of heredity, found that the first generation of crosses follows the dominant parent (though it is impossible to tell which is the dominant parent in any particular except by results), but that mating together members of this first generation invariably produced four different groups in which appear various likenesses to remote ancestors, so that no one can tell anything about what will come of such a mating. In this way the work of years in establishing certain color or type characteristics is undone.

This does not apply to the work of skilled breeders who sometimes in establishing a new breed make crosses in order to add certain valuable qualities. In these cases the cross is made, and the first hybrid generation bred back to the original parents, thus keeping close to that type, but varying where variation is desirable. Professor Dryden, of the Oregon station, in order to build up a breed which should be heavier than the Leghorn and a better layer than the Plymouth Rock, made a single Leghorn-Rock cross, and then mated back to the Leghorn parent, so that his famous 300-egg hen has seven-eighths Leghorn blood and one-eighth Rock blood, and the layer in the same pen of sisters, which almost equalled this record, has three-fourths Leghorn blood and one-fourth Rock blood. These hens are as white as pure bred Leghorns, but have more of the Rock shape.

This shows what science can do, but most of us are not scientists, and the best we can do is to use the magnificent breeds we already have and be thankful we have them.



Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

Ground Limestone
for
Agricultural Purposes

Nearly all lime used, no matter in what form, is prepared directly, or indirectly, from deposits of Calcium carbonate, chief of which is Limerock, from which our Ground Limestone is made.

We quote as follows from the Kentucky Agricultural Exp. Station, Bulletin No. 84, under heading "Lime for Agricultural Purposes."

> "Fresh burnt lime and hydrated lime may give better results the first year than ground limestone, but this is because of its caustic effects on the organic matter of the soil, causing a more rapid giving up of nitrogen. Experiments in Maryland and Pennsylvania show that used through a long period of time, the raw ground limestone gives the better results."

Our Ground Limestone is made from the highest quality limerock obtainable, and is ground to the proper degre of fineness recommended by the University of California.

You can get prompt deliveries from us either in bulk or sacked. Write us for further information, prices, terms, etc.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Leag Weakness

What is trouble with hens that cannot walk?—Subscriber, Modesto.

Leg weakness in grown birds is usually due to upset digestion, the result of overfeeding or of feeding too fattening foods, combined with too little exercise. Sometimes the pressure of an unlaid egg on the nerves of the pelvic region causes temporary paralysis. Sometimes, when hens are very fat and exercise very little, the weight of the body makes walking difficult. It is impossible to say what is the matter with these hens without knowing a little more about their symptoms and the rations they are on, but the chances are they are overfat. Cut corn and corn meal out of the ration, add more bran to the mash and see that they have about 15 pounds of fine bone meal to 200 pounds of dry mash. Give more alfalfa and other greens, and above all make them work. Let them scratch for all their grain, and if they can be given free range for a while with just a feed of wheat and oats or barley at night, so much the better. Sometimes rheumatism makes a hen so stiff and lame that she does not care to walk, but rheumatism is always due to dampness, and only extreme carelessness about standing water in houses and runs could cause it in a dry season. The only cure for rheumatism is removal of the cause.—J. A. K.

Rabbit Questions

Please tell a subscriber what kind of rabbits are being raised for the Los Angeles market? How are they sold, by the piece or pound, and is the skin of any value? Where can one obtain information on the subject of raising rabbits, houses, feed and care?—Subscriber, Riverside.

Chiefly Belgians, New Zealands and Flemish Giants. They are usually sold by the piece, though sometimes by the pound. The skins are purchased by a few business houses on this coast, one in San Francisco handling and advertising for a considerable number last year. When in condition and tanned properly their skins are very handsome.

One can obtain information on the subject of housing, feeding and care of rabbits by consulting any experienced rabbit fancier, or securing literature from any house handling poultry supplies. (We may add that there is a book by Townsend, "Practical Rabbit Keeping," printed at $1.25, but practical rabbit people of California say that as it is written from an English standpoint it has little real value for the Californian. A little 25c book, "The Belgian Hare Guide," which can be supplied by the Cultivator, or with the Cultivator for one year at $1.15, has been declared by some rabbit breeders to have a greater fund of information for Californians.—Editor.)

Many in Southern California are doing well with their rabbits as they always find a ready sale at a profitable figure during the winter months, due no doubt, to the present high cost of beef.—R. V. M.

Drooping Ears.

I have some young rabbits whose ears droop down, some one and some both. What is the cause? Can you give me information what to do for them?—Subscriber, Selma.

The cause of this serious defect in rabbits has never been established and comes occasionally with the most careful breeding. In exhibitions, a rabbit with one or both of its ears drooping is disqualified by the judge, as standard requirements demand, and such specimens should never be placed in the showroom. It is not even considered a wise policy to breed from a specimen so affected, as many rabbit breeders are firm in the belief that they have a tendency to reproduce this defect in many of their offspring. Hot or extremely warm weather will often cause drooping ears in rabbits and when once down badly they are not likely to recover. Inbreeding improperly is said to be another cause, and some people believe it is through improper feeding. However, whatever the cause is, authorities do not offer a solution, and as to a cure for it, there is no reliable method of prevention.—R. V. M.

Sorrel in Lawns.

How do you handle sorrel which is such a pest in lawns of blue grass, lippia and even devil grass? We have been told that lime will correct condition of the soil so it will not bother, but this does not seem to work out in practice.—Subscriber.

There must be something wrong with the lime or its application, or quantity used, for it does "work out in practice." I know of one lawn where the sorrel grew thickly over the surface and little grass could be seen. A liberal application of airslaked lime was given, and all sorrel quickly disappeared. It is well to know that a certain amount of soil acidity is necessary to the life of sorrel, and when this is neutralized by the lime the sorrel dies. Extreme acidity would demand a liberal amount of lime; at the rate of a ton to the half-acre, perhaps; certainly not more, or some other defect is indicated. Lack of even ordinary drainage or the presence of hardpan close to the surface may prove a fatal defect, and if liming does not correct the acidity the lawn should be made over, spading deeply, and all sorrel will disappear.—E. B.

Preserving Citron.

How is commercial citron preserved?—Subscriber, Soledad.

The fruit is cut from the tree, halved, and covered with brine. This may be for a period of a few weeks or for a few months. In shipping the fruit from trees in the Mediterranean country to processing works the usual method is to ship in large tanks filled with ordinary sea water. Later the pulp is scooped out and, after removal of the excess salt by immersing in fresh running water, the fruit is placed in a weak syrup, the strength of which is increased from time to time until ultimately a saturated solution of sugar is used. The fruit is then dried and marketed. There are a number of citron trees in California, but we do not think the processing of this fruit will prove of great commercial importance to this country. For home use orange and lemon rinds are often parboiled, then immersed in syrup and dried. Also for home use the citron melon makes a fair substitute.

Italian Prunes.

Do Italian prunes make a better dried prune than the French, and would you advise planting them in preference to the French prune?—Subscriber, Beaumont.

There has been no prune tested in California which has equaled the common French prune, prune d'Agen, in commercial importance.

Stallion Registration.

Is it necessary to register a stallion in California, and to whom should one apply for registration?—Subscriber.

The California registration law was passed and approved May 1, 1911. It specifies that every owner of a stallion which is offered for public service shall file full information regarding the animal with the California stallion registration board, of which A. L. Scott, Sacramento, is president. Would suggest you write Mr. Scott for full information.

Concrete for Olive Vats.

I notice in the olive pickling article recommendation of the use of cement troughs. Have these vats of cement been found successful?—Subscriber, Dehesa.

Concrete is used by practically all the larger pickling works in California and has been found entirely successful and not affected by the lye solution. The life of a well-built redwood vat is about 12 to 15 years; the concrete vat is almost everlasting.

Pear on Quince.

Can a Bartlett pear be grafted on quince, and what is the best time to do it?—Subscriber, Santa Barbara.

Where a dwarf tree is desired quince is used, and the Bartlett is one of the first recommended as doing well on quince stock. In fact, where blight is bad the Angier quince has been advocated as a means of keeping sound root. However, the commercial orchards of this state are almost entirely grafted on French pear sets. December or early January is the usual time for grafting. California conditions are such, however, that considerable latitude is possible.

Transplanting Cactus.

How about transplanting cactus two or three years old? What is the best time?—Subscriber, Modesto.

July and August are probably the best months for resetting cactus, and the fact that it is two or three years old would not be a serious objection, especially if one removed many of the leaves or slabs for resetting. If fresh slabs are removed and put in at this time of the year the rains are liable to cause them to rot.

Morning Glory.

I have a small piece of ground infested with wild morning glory. Have tried every way I know of to get rid of it, but without success. Can you give me any information regarding it?—Subscriber, Nestor.

The morning glory pest is a serious one and probably the best remedy of all is through cultivation every Monday morning before any other job of the week is taken up. A few weeks of this thorough cultivation will discourage the plant for want of breath and it will die out; but bear in mind that it must never be allowed to show green leaves above the surface. In cultivating the various patches be sure that bits of roots are not dragged from the infested section to clean land. Remove all broken pieces before passing from one patch to another. Efforts have been made to smother it by covering deeply with straw or manure. Some have applied salt a couple of inches deep over the patches. This latter method is effective, but of course poisons the land for a period of years for all other crops. On large ranches the poisoned land has been considered less of a detriment than the maintaining of a pest to destroy other sections of land, but with high-priced land which is intensively cultivated the best plan is to use the weed cutter on the cultivator.

Gum Trees Near Line.

Can a neighbor compel me to take up trees which are one and a half feet from line? The trees are four years old. They were planted for a windbreak.—Subscriber, Lomita.

Any one may maintain trees on his own land as he pleases, but if there is damage to neighboring property the owner of the property, after proving the damage, may collect it. We do not believe this has been tried in California, however, and it might be a difficult matter for the owner of neighboring property to make proof as to the real damage caused. Of course, if the branches or roots reach over the adjoining property the owner of it is justified in removing them.

Fleas on Cat and Rabbit.

How can I rid cats and Belgian hares of fleas?—Subscriber.

You may wash the cat in a lukewarm solution of soapsuds to which a tablespoon of household ammonia has been added for each gallon of water. Be careful this does not get in the cat's eyes. Or wrap the animal in a cloth and rub buhach into the fur next the skin. This will deaden the fleas and they will drop onto the cloth, when they may be burned. Cat fanciers control this pest by the use of a fine comb. With rabbits; keep the hutches thoroughly clean, removing collections of dust, which form breeding places for insects, and dust with buhach.

Moldy Corn for Poultry.

Do you think that white corn that heated in the sack, but as soon as discovered was emptied and thoroughly dried, would injure chickens? —Subscriber, Tulare.

Corn that has once commenced to mold will never be fit for feed again. Drying does not kill the mold germs, and these, when taken into the digestive organs of a fowl, grow and multiply in the tissues and cause very serious trouble. It is possible, of course, that adult fowls might eat this corn and not suffer, but there is always danger.—J. A. K.

Grafting Walnuts.

I have a nine-year-old walnut grove of ten acres in which there are trees that bear bad nuts (some ten per cent of trees). Please advise me fully as to grafting these trees and what kind of trees it is most desirable to cut scions from and at what season. Our La Habra Association wants only Placentia Perfection nuts. My trees are budded but the shells are rough and nuts don't sell well. The soil in my orchard is a heavy sediment loam, gradually growing lighter in color as we dig down. Would you advise a light dynamiting of this ground?

Some of your trees are evidently seedlings and being only nine years old will not be too large to top graft profitably. By marking these now in some way so as to distinguish the unprofitable trees, the branches can be cut where they are not more than three inches in diameter, February next, and two or three scions placed in each branch. Usually a well balanced tree can be made by using from 6 to 10 branches. The other branches should be cut off close to the trunk and the scar painted over with some metallic paint or a heavy asphaltum paint. If you want Placentia Perfection nuts, select your best producing Placentia tree from which to cut scions. These may be cut just as needed, or may be cut earlier if they are kept in damp sawdust or in damp sand, but be sure they are kept damp and are never in a wet mass. There will be no advantage in using dynamite in the soil you describe, but the liberal use of strawy manure and cover crops deeply plowed under will be very beneficial.—J. B. N.

An adequate training for teaching in the shortest possible time and at the least possible expense. Write for journals. Address Western Normal, 635 E. Main St., Stockton, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

SANITARY WARMING CLOSETS. PAT. APP. FOR.

RESERVOIR LIFTS OFF AND ON EASY AS A WASH BOILER.

Good cooking made easy!

Good cooking depends as much on the range as on your skill. A cheap range or worn out stove makes cooking uncertain; and often spoils your best efforts.

Is that fair to you, or to your family, whose health and good humor are effected by what you serve?

The Majestic makes good cooking easy and sure. Made of charcoal iron and malleable iron; it stands rust and wear three times as long as ranges made of ordinary range metals. Put together with cold-rivets that keep the joints absolutely tight always, (no putty used.) Lined with extra heavy pure asbestos that holds in the heat and reflects it onto oven. Scientifically designed to maintain uniform temperature with least use of fuel; and to circulate heat evenly to all parts of oven. You never have to "turn the baking" in a Majestic.

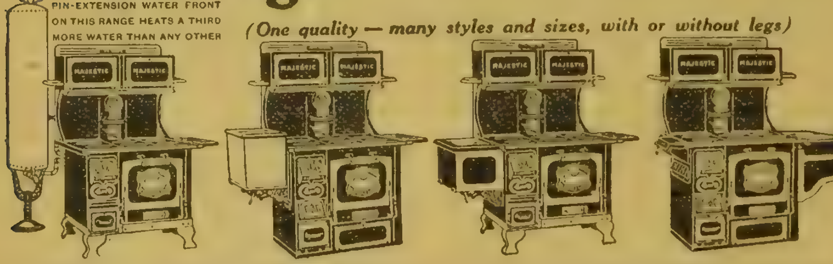
[The 15 gallon all copper reservoir heats water as quickly as a kettle on a stove top; oven door lowers onto heavy braces; oven rack stays level, under load, when pulled out. Reservoirs flush with stove top have aluminum lids.]

The cost of a Majestic, in **service**, is less than that of any ordinary range. The fuel, repairs and work it saves and the **years** longer that it lasts, more than offset its little extra cost.

If you realized how much the Majestic reduces the work and worry of cooking, you would get one now. Find out! If you don't know the Majestic dealer near you, ask us. (There is one in every county of 40 States). Write for "Range Comparison" explaining the many Majestic points of superiority.

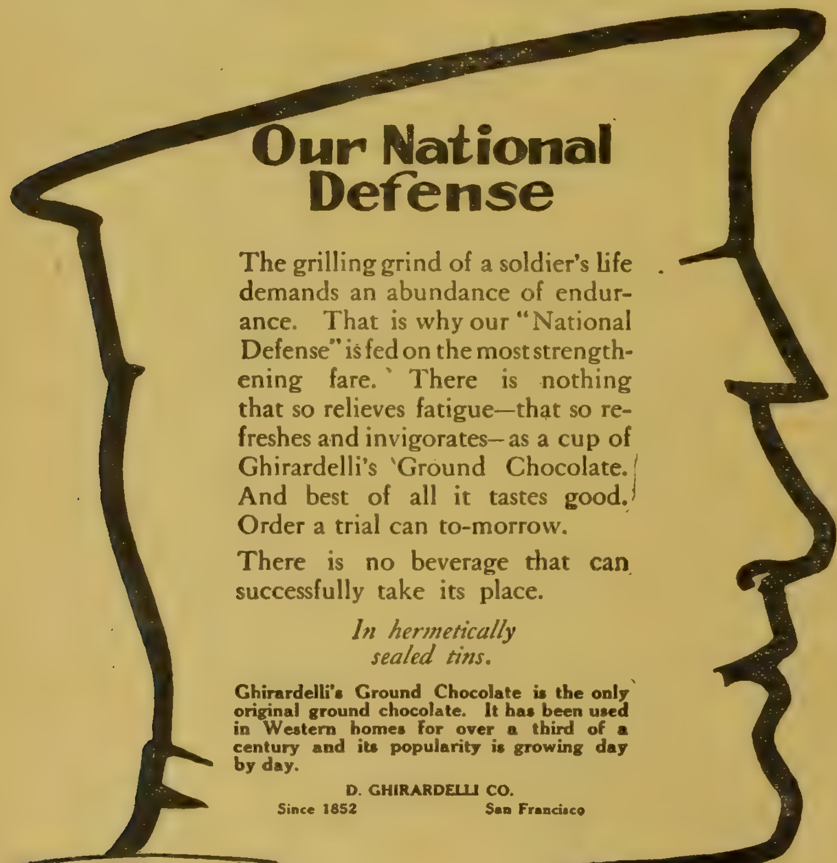
Majestic Mfg. Co., Dept. 203 St. Louis, Mo.

Great Majestic
Malleable and Charcoal Iron
Range



PIN-EXTENSION WATER FRONT ON THIS RANGE HEATS A THIRD MORE WATER THAN ANY OTHER

(One quality — many styles and sizes, with or without legs)



Our National Defense

The grilling grind of a soldier's life demands an abundance of endurance. That is why our "National Defense" is fed on the most strengthening fare. There is nothing that so relieves fatigue—that so refreshes and invigorates—as a cup of Ghirardelli's Ground Chocolate. And best of all it tastes good. Order a trial can to-morrow.

There is no beverage that can successfully take its place.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

D. GHIRARDELLI CO.
Since 1852 San Francisco

The European war will not increase our price during 1914.

GHIRARDELLI'S GROUND CHOCOLATE

The Household Department

WHEN TROUBLE COME ROUND

When Trouble knocks hard on my kitchen door,
I don't git up an' answer no more;
I set right still till his han's git sore.

Years ago when I was young an' thin,
I uster git up an' ask him in,
An' listen to all the yarns he'd spin.

An' I'd think all day, an' I'd dream all night,
Till I didn't hev no appetite,
An' I couldn't work an' I couldn't fight.

Then I woke one day with an awful start,
With a change of head an' a change of heart,
An' I laid fer Trouble to play my part.

When he come along an' he saw my eye,
He turned 'way out fer to pass me by;
An' I held my head up bold an' high.

So now when he knocks at my kitchen door,
I git my club an' I cross the floor;
But Trouble don't hang aroun no mor.e
"Century".

IN SPITE OF MAGIC

A Story For All-hallow Eve

By Lillian Wentz

YOUNG CORNELIUS BABCOCK settled his neckties and thrust in its crimson folds his turquoise scarfpin. Then he stood away and admired the snowy whiteness of the rubber collar that looked exactly like linen and saved many a laundry bill by its deceptive use; he stroked the glossy smoothness of his olive green striped suit; he stuck out a neat foot attired in a pale blue sock and shiny patent leather pump and smiled with satisfaction. It would be a critical maiden, indeed, who would not look with favor upon Mr. Babcock in this festal array, for he had health and youth and a measure of good looks. He was going to a party, and he was in love. It showed in his face and in his eyes.

Suddenly he reached into an obscure corner of the bureau drawer and drew forth a tiny box. From this box there issued a small gold ring, set with a cheap red stone. Cornelius gazed on it with quickened breath. He had planned to wear it on his little finger that night. She would ask him about it, and he would ask her to wear it if she wanted to. It all seemed so simple as he had planned it, and now he scarcely dared place it on his hand. Suddenly it found place on his finger, and the stone flashed as he lifted a hand and turned out the gas.

As he strode through the dining room, where the elder Cornelius sat reading the evening paper, his mother's voice halted his steps.

"Where you going, Corny? My, but you're dressed up!" She beamed at him over her spectacles.

His father lifted a shaggy gray head and surveyed his son with apparent scorn. "What you rigged like a nigger minstrel for?" he growled ontemptuously.

Cornelius writhed inwardly. His face flushed, and he stammered con fusedly. "I'm going to a party. I guess I won't be home till late. Mary Finn's giving a Halloween party."

The Finns lived in upper New York, and on this particular night their small flat was filled to overflowing with a merry company of young people.

All sorts of paper decorations hung from the walls and chandeliers. Jack-o'-lanterns were suspended in the doorways and swayed grinningly as tall heads passed to and fro. In a circle of laughing young men and girls Mary Finn was outlining her program for the evening's fun.

"We'll tell fortunes by melting lead and dropping it in cold water, and we can roast chestnuts on the gas stove. There's a tub of water and apples to duck for in the kitchen, and afterward you peel the apples and throw the paring over your shoulder. It curls into the initial of the one you're going to marry! It does" Mary blushed charmingly, and Cornelius intercepted her smile and took it to himself.

"And what else,Mary?" A broad shouldered young man with a shock of thick, dark hair moved forward and obstructed Cornelius' view of Mary Finn.

"It's for us girls to do," giggled Mary. "We let down our hair at midnight and take a lighted candle and a handglass and walk backward around the house three times. Only this being a flat we'll have to walk up and down the hall, I guess. If you're ever going to get married, you'll see the face of your future husband in the glass."

"Do you believe that, Mary?" asked a thin faced girl sharply. "You seem to take it like it was dead earnest, but"—

"Ask my mother," returned Mary proudly, and genial Mrs. Finn nodded complacently.

"It's true, ain't it Michael?" she asked of Mr. Finn, who murmured assent. "I saw Mike as plain as could be looking over my shoulder, and I married him, didn't I? Don't be so skeptical, Kitty; it ain't healthy. Keep young and foolish as long as you can."

The thin faced Kitty smiled politely and sat down near Cornelius. "Things don't come like that do they?" she asked him. "I mean the things you want to happen don't come so easy. You have to work to make 'em come right.'"

"I—I don't know. I never thought much about it," admitted Cornelius, conscious that he had been wildly hoping that some reflection of his face might be projected upon Mary Finn's mirror.

"Hump!" ejaculated Kitty scornfully as she moved away.

It was a delightful evening. There were much fun and merriment over the fortune telling and the apple ducking. Cornelius was lifted to heights of bliss when Mary's paring dropped over her shoulder and formed a distinct B—for Babcock, of course. But he was plunged to the lowest depths when he learned that the broad shouldered young man's name was Brady—Christopher Brady—so he stood an equal chance with Cornelius.

(Continued next week)

DIDN'T LIKE DOGS

Hobson—Are you in favor of that curfew law? Dobson—Yes. I'm in favor of any law that reduces the number of dogs.—Judge.

One of Our Houses

You Can Build Your Own Home Easily, Quickly and Economically

Not a portable but a permanent, substantial and attractive home.

We furnish the lumber, trim, windows, doors, cut and numbered to fit our plans. You follow the plans with your hammer.

No building experience necessary. All hardware, nails, paint, stain, plaster or interior wall-board furnished with plans.

Your own ideas carried out. Satisfaction guaranteed. Catalogue of plans. Send for it today.

IDEAS FOR THE COOK

Written for the California Cultivator
by Isabel Cottle.

Breakfast.

Ripe Blackberries.
Cracked Wheat. Cream.
Eggless Pancakes. Honey
Coffee.

Lunch or Supper.

Royal Bouillon.
Tomato and Watercress Salad.
Stuffed Egg Plant. German Horns.
Apple Pie. Cheese.
Tea or Milk.

Dinner.

Lettuce, Roquefort Cheese Dressing.
Veal Loin Chops, Sweet Potato Croquettes.
String Beans, French.
Apple Tapioca. Cream.
Coffee.

Eggless Pancakes.

One pint milk. Sift one heaping teaspoon baking powder with one cup flour, one-half teaspoon salt, and stir into milk. Add enough flour to make good stiff batter. Melt one heaping tablespoon butter and stir into batter. Thin with more milk if necessary. The cakes are improved if the batter is allowed to stand a short time. When frying cakes for a large family, butter them, stack and place in a warm oven and they will remain light and tender.

German Horns.

Scald one pint milk. Add three tablespoons butter, and when lukewarm one cake compressed yeast. Let dissolve, then stir in enough flour to knead. Knead on board 20 minutes, adding flour as necessary. Put back in bowl and set well covered in warm place until very light. Put on board and roll out in sheet one inch thick. Cut or shape in crescents, place in greased pans so they will not touch and let raise for about one-half hour. When light put in quick oven. Beat together one tablespoon sugar, one of milk and white of one egg. Have some almonds chopped fine. When rolls have been in oven 10 minutes take out and brush with egg mixture and dust with chopped almonds. Put back and bake five minutes longer.

String Beans, French.

Cook a quantity of string beans until tender. Melt a tablespoon of butter or beef drippings in frying pan, and in it cook a small, finely chopped onion until tender, but not brown. Add the beans to the onions, sprinkle over them a level tablespoon of flour and stir together. Add, if you have it, a little beef broth and season well with salt, pepper and a little finely chopped parsley.

Royal Bouillon.

To make three pints of rich bouillon take 2½ pounds lean beef, finely chopped, and cover with 2½ quarts cold water, allowing it to stand for one hour; then cover and place on a moderate fire, only just simmering for three hours, and remove any scum that may arise; now add one small onion, one carrot, a sprig of parsley, one bay leaf, two cloves, four peppercorns and two stalks of celery, all cut into dice, and simmer until the vegetables are tender. Strain into an earthenware bowl and let cool without covering. When ready to serve remove any grease and place in a granite saucepan with the white of one egg, stirring until it boils; then strain again through a fine cloth, without pressing, and serve immediately.

HOUSEHOLD QUERIES

Recipes for Tamales.

Request has come from a subscriber for recipes for tamales. We give three excellent ones.

Beef Tamales—Boil one pound of beef and pour over it some hot beef fat. Scald thoroughly one quart of meal, adding one teaspoon salt and a tablespoon lard. Cut off the upper end of corn shucks and put to boil in cold water; let scalded meal and shucks cool off; chop the beef fine and season to taste with salt and chili powder. Put a thin layer of meal on shucks (leaving shucks enough to turn ends and sides under), then put a small quantity of meat in center. Put a few shucks in bottom of a pot to prevent scorching and pack in the tamales, placing a weight on top. Cover with boiling water, adding one tablespoon each of lard and chili powder. Steam one hour.

Chicken Tamales—Cook a good-sized chicken in salted water and when tender chop the meat fine. Peel and seed a dozen red peppers, soften in warm water, then chop fine with a clove of garlic. Fry a small onion in a little lard and when brown add a tablespoon of flour, then add peppers. Cook for five minutes and add chicken with some finely chopped olives and a few raisins, if liked. Season the mixture with pepper, salt and a little sugar; meanwhile prepare a paste by mixing cornmeal with some of the liquor left when the chicken was boiled. Add a little butter or lard, season with salt and knead well. When the chicken mixture is well cooked take the necessary number of good corn husks that have been softened in warm water and spread them, first with cornmeal and then with chicken. Roll the husks so that the cornmeal will be on the outside; turn the ends and tie with twine; steam three-quarters of an hour and serve in husks.

Chicken Tamales—Boil chicken until tender; remove bones and chop meat fine; to each pound of meat add one medium-sized tomato and onion, chopped fine, salt and red pepper to taste, and moisten to the consistency of mush with chicken broth. Heat the remainder of the liquor to boiling, stir in cornmeal, make a little stiffer than ordinary mush and cook thoroughly. Soak fresh corn husks in warm water until soft, then spread a half inch layer of mush on each husk, put a good spoonful of the meat mixture on that and roll up so that the meat is covered by the mush and the whole is nicely wrapped in the husk. Turn in the ends, tie tightly with twine and steam half an hour.

For Falling Hair.

My hair is very thin and scalp covered with dandruff. It seems as if nothing would stop it. Do you know a remedy?—Reader, Corning.

Sea salt dissolved in water in the proportions of one teaspoon to one-half cup of water has been found entirely effective in many cases of dandruff and falling hair. Dip finger tips in the salt solution and rub vigorously into the scalp every day. It is not necessary to wet the hair; the value lies in getting the sea salt solution directly on the scalp and stimulating it by the massage. In a few days you may notice a slight crust of the salt forming on the scalp, but it is not so noticeable as the dandruff and is easily removed when washing the hair. Be sure to persist in the treatment regularly; it will take only five minutes a day. Done just before retiring the time is not noticed, but very soon the invigorating effect is. Be sure to buy sea salt.

NOT SO SUDDEN.

"I have saved up $500 so that I could ask you to be my wife."

"This is rather sudden."

"Sudden? I've been scrimping for three years."—Pittsburg Post.

Warm the bath room

with the glowing heat of the

PERFECTION OIL HEATER

Mother and children need it for the bath—father for his morning shave.

For Best Results Use Pearl Oil

BETTER LIGHT FROM KEROSENE

TEN Days FREE Send No MONEY

Beats Electric or Gasoline

You Can Prove Our Claims Without Sending a Cent

We don't ask you to pay us anything until you have used this wonderful new modern incandescent light in your home for 10 days, putting it to every possible test and then if you don't say that it is the greatest oil light that you have ever seen, or you are not thoroughly satisfied, you may send it back at our expense. You can't lose a penny. We want you to prove for yourself, as thousands upon thousands of others have, that the Aladdin has no equal; that it makes the ordinary oil lamp look like a candle; that it **saves one-half on oil**; that it beats electric, gasoline or acetylene; lights and is put out like old style oil lamp; burns common kerosene (coal oil) without odor, smoke or noise; is clean, won't explode, guaranteed.

We Will Give $1000.00 to any person who shows us an oil lamp equal to the new Aladdin (details of this reward offer given in our circular which will be sent you). Would we dare make such a strong challenge if there was any question about the superiority of the Aladdin over all other oil lamps?

Get One FREE We want one user in each locality to advertise the Aladdin. To that person we have a special introductory offer under which the one lamp is **given free.** Drop us a postal and we will give full particulars about this **unequaled offer on an unequaled light** and our **10 Day Free Trial.**

We Want Men With Rigs or Autos to Deliver the Aladdin on our easy plan. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before, writes: "I sold 51 lamps the first seven days." Another says: "I disposed of 34 lamps out of 31 calls." Thousands of others who are coining money endorse the Aladdin just as strongly.

No money required. We furnish capital to reliable men to get started. Ask for our distributor's plan, and learn how to make big money in unoccupied territory.

San Francisco Market

SAN FRANCISCO, Oct. 20, 1914.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Butter has gradually advanced and is now firm. Some extra fine stock has sold slightly above quotations.

Prices to trade 4 cents above following quotations:

Extras	.32
Prime Firsts	.28
Firsts	.26
Seconds	.24

CHEESE

Wholesaler to retailer.

Oregon Y. Am.	.12½@15
California Flats	.10@15½
Cheddar	.20
Oregon Twins	.14½

EGGS AND POULTRY

The advance in eggs has been phenomenal. Market is now firm at the higher prices.

Prices to trade 3 cents higher than following quotations:

Extras	.49
Select Pullets	.35
Storage Extras	.30

Price to producer:

Hens	.15@18
Fryers	.19@20
Roosters, old	.12
Roosters, young	.17@19
Broilers	.19@21
Belgian Hares, lb.	.9@10

Citrus Fruit Market

LOS ANGELES, Oct. 21, 1914.

The Valencia market is much stronger. At the beginning of this week there were about 650 cars of Valencias yet to ship from California. By the end of the week one-half of this will have been shipped, which will end the heavier shipments. The remaining 300 or 400 cars will be distributed over the period between this and November 10. It is thought that date will see every Valencia out of California. The early navel sections are reporting fruit coloring nicely, and shipment will begin during the first week in November. Reports from eastern markets are in effect that Floridas are holding back, waiting for California Valencias to get out of the market before sending in any quantity. Shippers of fruit at present prices are receiving not far from $1.50 net, this for good fruit.

Lemon market featureless with few shipments going forward.

Shipments

Shipments of oranges to date since November 1, 1914, 38,436 cars; lemons, 2,862; total, 41.298. To same date last season: Oranges, 13,520; lemons, 2,175; total, 15,695. Total citrus fruits two years ago this date, 35,895.

NEW YORK, Oct. 19.—Twenty-two cars Valencias sold. Market strong, generally higher. Weather fair.

THE WALNUT SITUATION

Regarding the present walnut situation, we have to advise that indications now point to a lighter crop of California walnuts than the state has produced for many seasons past. Our present estimates are for a total crop of 8,000 tons or less for the state. While the sizes of the walnuts are not running up to our earlier expectations, which is undoubtedly due to the fact that the nuts have ripened a little prematurely this year and to the further fact that the outer hulls which drop off before the nuts are gathered were unusually thick and pithy this season, nevertheless the quality of the goods is excellent. A peculiar feature of the output this year is the fact that, while the nuts are not running heavily to large sizes, nevertheless they are running exceptionally light to No. 2's. Against an average in 1913 of 27 per cent No. 2's, the crop is only averaging 3 per cent of this grade this year. We have therefore found it necessary to greatly reduce all No. 2 orders, and are now prorating on a basis of 40 per cent on all orders for this grade. We regret having to do this, but there is no alternative. We simply haven't got the goods, and they are not obtainable. We have not shipped a car which has not cracked up better than 90 per cent good, and the average crop is showing about 94 per cent, the great majority being beautiful clear white kernels. We are firmly of the belief that when the consumers' demand for walnuts around Thanksgiving time comes, the markets generally will show a shortage of supply and a consequent much stronger demand. It can hardly be expected that this demand on the part of consumers will develop much before the holiday period, as the average person has not thought of buying walnuts during the hot weather while so much fresh fruit is still available. It is now practically certain that but very limited supplies of foregn nuts will be available for this Thanksgiving trade, and as the average consumption of walnuts at this period is accurately estimated at 33,000,000 pounds, it is hard to figure where anywhere near this quantity of walnuts will be found this season.—California Walnut Growers' Association.

LEGAL

(Continued from Page 389.)

out of court. In 1907 the legislature passed an act repealing all former acts as to stock trespassing upon unenclosed land, and this act has the following provision: "It is unlawful for any person, firm or corporation, owning or having possession of any animal to suffer or permit such animal to break into and enter upon any land owned by or lawfully in the possession of any person, firm or corporation other than the owner of such animal, in all cases where such land is planted to growing crops, vines, fruit trees or vegetables and is at the time entirely enclosed by substantial fence or other enclosure."

No animal is exempt from execution under this act. However the act expressly makes itself subject to the act relating to estrays, enacted in 1901. This act of 1901 has been amended several times, the last amendment being 1909, and the wording of this act gives a person a lien upon the animal found upon his premises for all damages, expenses and costs, incident to the taking of such estray. The act defines an estray as follows: "The word estray as used in this act is intended to include all domestic animals that have strayed upon or been found upon lands other than those of their owner or the public domain or lands whose owner (or to which the person in possession thereof) has consented, may be passed over or allowed to be entered on by said animal."

Thus the owner of unenclosed land may take up trespassing animals and cause same to be advertised and sold. He cannot obtain damage against the owner thereof for the damage done to his property by such animal.

Line Fence.

Some years ago a neighbor and I agreed to build a line fence. I built one-half and he the other. However, his half of the fence was built some four or five inches from the line on his land and directly on the line were planted eucalyptus trees. In time the trees crowded the fence, which was rebuilt this time entirely on my land. Now the neighbor proposes to cut the trees which are on the line. Are these trees all his or have I an interest in them? Has the building of the fence on my land given any title whatever to the narrow strip which it and the trees occupy?—Subscriber, Los Angeles.

In case these trees are planted wholly or in part upon the boundary line they are the common property of you and your neighbor, and for injury to or destruction of such trees you may bring suit against him for the damage caused. Your interest is common with you neighbor s. The building of the fence upon your land has not, unless he has paid taxes upon the land enclosed, given him any title to that land.

Water Bill.

A. owns a house which he rents to B. at a certain price per month, water extra. B. pays his rent to A. and his water bill to the company regularly each month until the last month of his occupancy of the house, then moves out leaving the water bill unpaid. The water company shuts off the water and refuses to turn it on again until A. has paid B.'s water bill, and also one dollar for turning on the water. Will the law support the water com pany in their stand?—Subscriber, Sawtelle.

Under recent decision of the appellate court, the city of Los Angeles in case similar to the one stated was compelled to turn on the water without payment of the former occupant's bill.

Farmers' Club.

Can a farmers' club be formed and own property, either real or personal, without forming a corporation under the laws of the state? If it is necessary to form a corporation what is the cost and what steps are necessary?—Subscriber, Stockton.

You may form your club in the nature of a partnership. The best way would be to incorporate under the provisions for social corporations. These provisions require the articles of incorporation to be filed with the clerk of the county within which you are located, and certified copy thereof filed with the secretary of state. The particular provisions for corporations are extensively set forth in the Civil Code, Sections 593 to 606 and 290. The actual filing fees would amount to from $35 to $50.

Title to Homestead.

A. has a piece of land in his own name. He and his wife separated and without any action for a divorce or settlement she filed a homestead on this land, then bought her husband, A.'s interest and A. gave her deed as his wife. Then Mrs. A. deeded it to B., B. to C., and C. to D. Now the abstract company says, "Mrs. A. filed a homestead on this property, and for that reason should have had her husband's signature, as the deed from him to her did not convey his homestead right." However, a quit-claim deed from A. to D. would clear this up. Has D. a clear title or not and if not what is the trouble?

The law provides only two methods whereby land may be released from the homestead provisions; this is by declaration of abandonment or by grant deed executed by both parties. D. has a title which would be entirely enforceable under the circumstances stated. The cloud is so small that it will make little difference.

Water Right

A. buys land from a water company, paying $140 per acre with water right, paying three cents per inch for water used on land. The land was bought with the understanding that A. was to have use of such amount of water as he required to irrigate said land at three cents per inch. Now, by a ruling of the commissioners, the water company requires $6.00 per acre in advance payable in quarterly installments, regardless whether you want water or not. If not paid in 90 days after notice, A. loses all right to the water. Would like to know, if, in case A. refuses to pay the $6.00 per acre, as required by the water company, can the company take the water away from him. The land is set to apple trees in their fourth year; if the water company takes A.'s water away from him, can A. recover damages; land being valued now at $500 per acre with water right?—Subscriber.

The statement is "that the land was bought with the understanding" that A. was entitled to water at three cents per inch, as he might require. The rights of A. in this case depend entirely on his contract with the company. If, however, you have a contract for water at three cents per inch, you can bring action to require the company to comply therewith, and for breach of its obligation you can hold the company liable. From the statement in quotation, it would seem, however, that you had no definite contract for a stated period of time, but a mere oral agreement, which of course will be subject to change.

Right to Run Ditch

A neighbor is conducting his water in ditch over my land. The water leaves the head ditch on his land, afterwards coming through the fence and running a few hundred feet, being taken back within his boundary. Am glad to make the accommodation unless he will acquire permanent rights. Does he do this and in what period of time, and can I be protected by his giving me any written agreement?—Subscriber, Imperial.

Your neighbor and successors in interest would, after five years from the date of the commencement of this arrangement, attain a right by prescription to have the water run over your land; by making a written agreement licensing your neighbor to run this water for a definite period of time you may avoid such prescriptive right. It would be a more careful way to have this license agreement acknowledged and recorded.

THE YUBA BALL TREAD TRACTOR
how can you apply it?

Your natural questions regarding The Yuba Ball Tread Tractor:—

Can I use it profitably in my orchard?

Because it is designed for the exactions of orchard work, can I use it for plowing, harrowing and harvesting on my grain land?

What good is it for hops?

Will it work in a vineyard?

Can I haul with it over the roads in my vicinity?

When I need water can I couple it to my reserve pumps?

These and a hundred other questions are answered in this booklet.

THE YUBA BALL TREAD TRACTOR

Each of the main branches of farming are dealt with in detail in this booklet. The mechanical features are thoroughly explained. You are told why The Yuba Ball Tread Tractor is one of the best farm equipment investments that can be made; why its cost of operation and maintenance are lower than that of other forms of hauling-power producers on the farm, and why it gives "more power to the cubic inch of mechanism."

The coupon, filled out, brings the answers to your questions.

200 ACRE FIELD OF SUDAN GRASS GROWN BY E. J. COWART, LUBBOCK, TEXAS.

$UDAN GRASS

Read the facts about this wonderful new forage crop—satisfy yourself of the genuineness of Lubbock Association Guaranteed Seed.

You can't afford to take any chances when you order your supply. The success of your crop depends upon the quality and purity of the seed you put in. Poor seed can't produce anything but a poor crop and what is more, the adulterated mixtures that are sold as Sudan Grass Seed will sow your land with Johnson grass, weeds and other troublesome pests.

Here's the evidence for LUBBOCK ASSOCIATION SUDAN GRASS SEED given by the best authorities of the day:

Mr. Vinall of the Forage Division of the Department of Agriculture at Washington went on record as saying that the *Lubbock County Sudan Grass* crop was the finest he had seen anywhere in the United States.

Mr. A. K. Short, Supt., Temple-Belton Experiment Station, Texas, writes:—"The past year (1913) "Lubbock County grew more Sudan than any county in the United States, and more than any state in "the Union. This year it will still maintain the lead in seed production."

Mr. B. Youngblood, Director, Texas Experiment Stations, states: "We took special pains to organize a "local experiment association at Lubbock and have a considerable acreage planted there, as we felt that "the Texas Plains country would be one of the best seed producing centers in the United States."

The *Sudan Grass Seed* we offer for sale has been grown under the supervision of Texas Sub-Station No. 8, located in Lubbock County, V. L. Cory, Supt., and every field has been officially inspected, certified to and passed before harvesting. The Trade Mark of the Association is on every package and guarantees the strict purity and unquestionable germinating power of the seed.

WARNING—We are the only authorized agents for selling LUBBOCK ASSOCIATION GUARANTEED SEED. Be sure that all seed you buy has our name and trademark stamped on the bag. None other is genuine. This is the only way you can get protection from adulterated seed and insure a profitable harvest.

LUBBOCK SUDAN GRASS SEED ASSOCIATION
Selling Agency for Lubbock County Experiment Association
DEP'T C LUBBOCK, TEXAS

With Orders Amounting to $75.00 or Over

This offer is made to stimulate our mail order business. **We want everyone to have one of our Building Material Catalogs.** Follow these instructions and receive **750 sq. feet of galvanized poultry wire FREE.** Send coupon below for catalogue. Look over the thousands of bargains. Then send us your order, amounting to $75.00 or over, and the **FREE** offer will be shipped.

If order does not amount to $75.00, save your receipt and when you have purchased $75.00 worth of Building Material from us, we will ship **FREE** offer with the last order. All that is required is that the first order arrives before Jan. 1, 1915. **Can you appreciate this offer?**

Our prices on all grades of **Building Material** are 25 to 40 per cent under the market. Our **Million Dollar Stock** enables us to do this. Write today! Convince yourself that buying from us by mail is most convenient and economical. Look at the prices in list below. Compare them! And remember everything we sell is guaranteed satisfactory or money refunded.

THE WAY TO OBTAIN FREE FENCING

High Tank

Toilet Combinations complete to floor; special bankrupt stock	$10.00
Low down enamel steel toilet combination complete to floor	$12.50
Low down vitreous china closet combination; Special	$16.00
Special reductions on Kitchen Sinks: 20x30, No. 2; 18x36, No. 2	$2.75
Corrugated Galvanized Iron, special price, until further notice, all lengths from 6 to 10 feet; per 100 sq. ft.	$3.75
Roofing paper: 1 ply sanded	$1.00
2 ply sanded	$1.75

Samples sent on request.

A complete line of bath tubs, lavatories, toilets, pipe, fittings, etc.

Instantaneous heaters, in good order	$7.50
Fire damaged toilet combinations	$9.50
Sheet steel sinks, slightly smoked; all sizes; each	$1.00
Wall Board: 650 pounds to the thousand. No. 2, regular price $25, cut to per thousand sq. ft.	$19.00
Standard line House Paint, guaranteed. All colors, per gallon	$1.50
Shingle stain, all colors and black	$0.50
Graphite Roof Paint, per gallon	50c
Interior Oil Stains, per gallon	$1.00

Everything else in the paint line at proportionate prices. We carry everything in **Building Material.** Our stock is complete.

Lumber

We positively have the best offerings in Lumber, both in rough and finish, in Southern California. You lose if you do not write us for estimates.

Always the Lowest on Sash and Doors

We carry everything in this department. Two light, double hung windows, 1⅜ inches thick. Best Quality American window glass, all sizes..... 60c up

No. 1 Colonial Door, selected kiln dried Oregon Pine, this is a special value, all stock sizes....... $1.50 up

Second Hand Building Material Carried Only by Whiting Wrecking Co.

2x8 and 2x10 to 24 ft.; Per M.	$12.00
2x14 and 2x16, 24 ft. Per M.	$15.00
We have lengths to 38 ft. 3x14 to 38 ft. Per M.	$15.00
1x8 No. 3 Redwood boards. Per M.	$12.00
⅝x4 ceiling new. Per M.	$20.00
1-inch pine boards, all lengths, per M.	$11.00

HARDWARE

Copper bottom boilers	$1.50
Galvanized tubs, each	40c
Galvanized buckets, each	25c

A complete and full line of fencing of all kinds.

Everything in light builders' hardware.

Be sure to write all correspondence for second-hand building material to

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIII No. 18 LOS ANGELES: THURSDAY, OCTOBER 29, 1914 One Dollar Yearly

Don't Ship Green Oranges

The Department of Agriculture Has Sent to California Experts Headed by E. M. Chace, Who Will Aid in Determining What an Edible Orange Is. Work is Now Proceeding in Tulare County

TO the Members of the Citrus Protective League: In connection with the shipment of early oranges from California Dr. C. L. Alsberg, chief of the bureau of chemistry, United States department of agriculture, has written to the league as follows:

"As a result of the investigations carried on last year, it is believed that the northern district oranges may be considered to be immature when the juice does not contain soluble solids equal to or in excess of eight parts to each part of acid present, acid to be calculated as citric without water of crystallization. It has been determined to base this figure upon the acid solids ratio in preference to the acid sugar ratio for the reason that the growers and packing house foremen will be able to make the necessary analyses, which would be impossible in the case of sugars. As soon as the bureau has representatives upon the coast the question of instructing a limited number of packing house employees in making these tests will be taken up."

Efforts are now being made by a majority of the shippers interested in the early districts to have the fruit shipped conform to this suggested standard, and Mr. E. M. Chace, chemist in charge of citrus byproducts laboratory of the United States department of agriculture, has written out "Directions for Using Field Apparatus," which follows, and also a list of the apparatus necessary to enable the grower or packing house employee to make the determinations necessary to show whether or not his fruit complies with this suggestion. The apparatus can be obtained from any dealer in chemical supplies. The tests are simple and are easily made by any careful person.

It is our belief that the California citrus fruit growers generally realize the necessity of shipping only such fruit as will give satisfaction to the consumer and will endeavor to have all shipments conform to the standard suggested by the department.—F. O. Wallschlaeger, secretary.

Apparatus

1 Brix spindle, graduated in tenths, range from 10 to 20 degrees, with thermometer (Centigrade.)

1 cylinder of glass or metal, 15 inches high by one and one-half to two inches in diameter.

1 Pipette of 25 cubic centimeters capacity for measuring juice.

1 Pipette of smaller size for use with the indicator.

1 Burette of 50 cubic centimeters capacity, graduated in tenths, for measuring the standard solution.

1 Liter of standard alkali solution, preferably having one cubic centimeter of the solution equal to .01 grams of citric acid without water of crystallization.

One hundred cubic centimeters of a solution of phenolphthalein in alcohol, one gram to one liter in strength, for use as indicator.

An eight-ounce flask, beaker glass or precipitating jar in which to make the titrations.

A beaker or granite ware cup of one quart capacity for holding the juice.

The less expensive parts of the apparatus should be ordered in duplicate. The outfit can be obtained from dealers in chemical supplies.

Directions for Using Field Outfits

In order to make the sample as representative as possible, at least 12 oranges should be taken, preferably from several trees. They are halved or quartered depending upon the size, and the juice removed by means of a lemon squeezer. It is thoroughly mixed and strained through cheesecloth.

The glass cylinder is then filled three-fourths full of the juice, the spindle placed in it and sufficient juice added to overflow the cylinder. The spindle is allowed to remain for a few minutes, care being taken that it does not touch the sides of the cylinder. The reading is then taken, the line nearest the top of, but not in the juice, being read. The spindle is then partly removed from the cylinder and the temperature indicated by the thermometer noted. From table A the correction to be applied is found, and added to or taken from the reading. (It is subtracted where the reading is below 17½ degrees and added where it is over that figure.)

Example—Reading of the spindle 12.0, reading of the thermometer (C) 15.0. Correction given in the table .13. The corrected reading is therefore 11.87, which is the percentage of soluble solids in the juice. The specific gravity is then ascertained from table B. For the purpose of obtaining the specific gravity the corrected Brix reading can be assumed to be 11.9 and from the table the specific gravity of this solution is found to be 1.0481. (Where the second figure of the Brix reading after the correction is applied is above five the next highest figure may be taken, if five or below the next lowest figure may be used.)

To determine the percentage of acid in the juice, draw the 25 cubic centimeter pipette full of the juice and allow it to run out until the top level of the liquid reaches the zero line. Place the point of the pipette in the glass flask and allow the juice to flow into it. Do not hurry the flow by blowing into the tube. Add two or three volumes of distilled water and a few drops of solution marked "Indicator." Now add from the burette, in small quantities at a time, the standard alkali solution, shaking the flask constantly, until a permanent pink color is established. Now take the burette reading. To ascertain the amount of acid in the juice, multiply this reading by the factor for one cubic centimeter of the standard solution, this is usually .01. To find the percentage of acid divide the figure by the weight of juice taken. The weight of juice taken is obtained by multiplying its specific gravity by 25 (the number of cubic centimeters taken).

Example—The height of the liquid in the burette has fallen from zero to 41.1. This figure multiplied by .01 gives .411 weight of acid in 25 cubic centimeters of juice. 411 divided by 26.2, the weight of 25 c c of juice, gives 1.57 per cent of acid. (26.2 is obtained by multiplying the specific gravity of the juice, 1.0481, by 25.)

The acid solids ratio is now found by dividing the soluble solids by the acid.

Example — Soluble solids, 11.87, divided by acid, 1.57, gives the ratio of 1 to 7.6.

Table A

Table for the correction of Brix spindle when the reading is taken at other than the standard temperature 17.5 degrees Centigrade.

In using this table the tester must be sure that the Brix spindle is standardized at 17.5 degrees Centigrade.

Temp, of Juice, Deg, Cent.	Deg. Brix of the Solution 10	20
0	0.41	0.52
5	0.37	0.44
10	0.29	0.33
11	0.26	0.28
12	0.22	0.24
13	0.19	0.21
14	0.16	0.17
15	0.12	0.14
16	0.08	0.09
17	0.03	0.03
18	0.03	0.03
19	0 08	0.09
20	0.15	0.17
21	0.22	0.24
22	0.29	0.31
23	0.35	0.37
24	0.41	0.43
25	0.47	0.49

If temperature is below 17.5, subtract the correction.

If temperature is above 17.5, add the correction.

Table B

To be used to determine the specific gravity of orange juice from the reading on the Brix spindle.

State Dairymen in Session at Modesto

Dr. Leroy Anderson Gets Busy with His Little Camera and Big Pencil. Photos on the Cover and the Notes Following Result.

AN interesting feature of the dairy show was the love of fine stock shown by the residents of Stanislaus County. One might imagine that people who are in daily contact with cows would not trouble themselves to go far to see a cow show. But the large hay barn in which the cattle were tied was filled from morning to evening with an admiring crowd. It would appear that the cattle here had more visitors than at the state fair. Professor True, when placing the ribbons, was so surrounded by men, women, boys and girls that he had difficulty in seeing the cattle, all of which goes to show that cows are popular in Stanislaus County and that no other county can soon take a higher place in the dairy cow column than Stanislaus. Such spirit and such cows are hard to beat.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen — gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Important Notice to those attending ***THE FRUIT GROWERS CONVENTION***

The attention of the delegates and members who will attend the State Fruit Growers' Convention to be held in Los Angeles on November 9th to 14th, is called to the fact that the Hotel Northern has been selected as one of the headquarters, and in consideration of this the Management has made a very special rate for all delegates and their friends attending the Convention, which gives them the opportunity of obtaining a first-class room without attached bath for $1.00 per day, or a room with connecting bath for $1.50 per day; no extra charge, at either rate, for two persons occupying same room. These prices cover all rooms in the hotel, some usually renting as high as $5.00 per day.

The above special rates are made by the Management of the Hotel Northern to the members of the State Fruit Growers' Association and their friends in order to get this new, modern, fireproof hotel known to the fruit growers of the state. Send them a postal card and room will be reserved for you.

State Fruit Growers Convention

45th State Fruit Growers Convention Combined with Fruit Growers Second Annual Assembly and State Association of County Horticultural Commissioners. Women's Department Will Have Attractive Features

THE week of November 9-14 promises to be one rich in opportunity for fruit growers. Monday and Tuesday will be given to the county horticultural commissioners.

On Tuesday evening the state convention proper will be called in the assembly rooms of the former Normal School building at Los Angeles. The committee of arrangements has made plans for every convenience for the convention and the program committee has a magnificent offering of speakers.

Each afternoon the women's department of the convention will gather in the parlors of the Hotel Clark. Miss Lilian D. Clark of Berkeley will have charge of these meetings, and women from all sections of the state will make addresses on home economics and business opportunities for women in horticulture.

The railroads have granted fare and a third rates, and it is urged that every attendant at the convention buy a one-way trip ticket and demand receipt from the ticket agent, which will be signed by the secretary of the convention and will be warrant for one-third fare on the return trip.

Convention of County Horticultural Commissioners

On Monday morning President Stabler, of the County Horticultural Commissioners' Association, will call the meeting to order. The points discussed will be: "Depot Inspection," by Messrs. F. W. Waite and A. S. Hoyt; "Law Enforcement," C. W. Beers; "Relation of Farm Adviser to County Horticultural Commissioner," W. B. Parker; "Inspection Methods," H. A. Weinland; "Future of County Horticultural Commissioner," G. H. Hecke; "Timely Hints," H. P. Stabler.

Afternoon Sessions—"Crown Gall and Hairy Root," R. S. Vaile; "Distribution of Injurious Insects," E. O. Essig; "Fumigation Methods," R. S. Woglum; "Pointers in Fungi," Prof. H. S. Fawcett; "Spraying and Fumigating—County Owned Machines vs. Contract Work," W. H. Volck; "Is Double Inspection Desirable," Geo. P. Weldon.

The evening session will be devoted to round-table discussion of subjects suggested during the day.

Special Potato Program

Tuesday, 10:30 P. M. (in Hotel)—"Cultivation of the Potato," E. H. Phreaner; "Fungus Diseases of the Potato," W. V. Shear; "Insect Pests of the Potato," William Garden; "Suggestions Called Forth at the Stockton Convention," Prof. S. B. Doten, Reno, Nevada.

State Fruit Growers

Tuesday, 7:30 P. M.—"Literature of the Farm," Mrs. Emily Hoppin; "Firing," J. E. Adamson; "Reciprocal Relations Between the County Horticultural Commissioner and the Nurseryman," C. W. Beers; "The Thermometer in the Orchard" (lantern), F. A. Carpenter.

Wednesday, 9:00 A. M.—Address of welcome, Louis M. Cole, president Los Angeles Chamber of Commerce; response, Dr. A. J. Cook; "The Work of the College of Agriculture Among the Farmers' Wives," Miss L. D. Clark; "Packing, Growing and Marketing Along the Atlantic Coast," J. H. Hale, Fort Valley, Georgia.

Wednesday, 9:00 A. M. (in Hotel Parlor)—"Semitropical Fruits Which Give Promise in California," F. O. Popenoe; "Semitropical Fruits," C. P. Taft; "Combating the Parlatoa Scale," A. J. Shamblin.

Wednesday, 1:30 P. M.—"Standardization," Prof. C. I. Lewis, Corvallis, Ore.; "Report on Standardization," Colonel H. Weinstock; "Uniform Horticultural Laws," M. McDonald, Portland, Oregon; "Marketing," Dr. G. Harold Powell.

Wednesday, 1:30 P. M. (in Hotel Parlor)—"Jelly Making," Mrs. Hilda B. Nielson; "Home Canning of Fruits and Vegetables," Mrs. Sara Roberts.

Wednesday, 7:30 P. M.—"Decay in Fruit," Prof. B. B. Pratt; "Farm Credits," Col. H. Weinstock; "The Mango" (lantern, F. W. Popenoe, Washington, D. C.; "The Scale Insects" (lantern), E. O. Essig.

Thursday, 9 A. M.—"Soil Hygiene," G. E. Bailey; "Trend of Opinion as to Soil Fertility," Dr. C. B. Lipman; "Review of Fertilizer Experiments at the University Station at Riverside," Dr. H. J. Webber, "Cover Crop Experiments," W. M. Mertz, "Root Stock Experiments," W. B. Bonns; "The County Horticultural Commissioner and the Farm Adviser," H. A. Weinland.

Thursday, 1:30 P. M.—"Soils," C. A. Jensen; "Water Requirements of Plants," J. W. McClane; "Fertilizing Citrus Crops," C. W. Leffingwell; "Review of Practical Experiments in Fertilization," Prof. R. S. Vaile.

Thursday, 1:30 P. M. (in Hotel Parlor)—"Women in Horticulture," Miss Kate Sessions; "Opportunities for Women in Horticulture," Mrs. Myrtle Shepard Francis.

Thursday, 7:30 P. M.—"Summer Cover Crop in Southern California Orchards," C. S. Milliken; "Pruning" (lantern), G. P. Weldon; "How to Develop Our State," Dr. T. F. Hunt; "Horticultural Quarantine and the Parcel Post," A. S. Hoyt.

Friday, 9:00 A. M.—"The Orange," C. C. Chapman; "Chemical Studies of Oranges," H. D. Young; "Production of Available Nitrogen in Citrus Soils," I. G. McBeth; "Citrus By-Products," C. P. Wilson.

Friday, 1:30 P. M.—"The Future of the Lemon," C. C. Teague; "New Fumigating Machine," G. P. Gray; "Fumigation," R. S. Woglum; "Newer Insecticides," M. R. Miller.

Friday, 1:30 P. M. (in Hotel Parlor)—"How Can a City Woman Make a Living in the Country?" Mrs. Emily

ZENO

The Most Efficient and
Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times as many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controlling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

CITRUS CANKER

A Florida inquirer has written for information as to best procedure in the matter of citrus canker. We must first inform him that he comes to a state which has not yet had, and sincerely hopes it never will have, experience with this disease which seems to sweep out of existence every member of the citrus family once it gets started in a locality. Our inquirer's own state has now become thoroughly aroused as to the danger from this trouble and it is rumored that a lax state horticultural official has permitted the extensive spread of the disease. This, however, is doubtless due to lack of understanding of its serious nature.

As to treatment of the disease there seems to be none, other than to deluge the tree with oil, surround with straw and touch a match to it. This heroic treatment is given to entire orchards in Florida, more than 100,000 nursery trees and nearly 2000 bearing orchard trees having been destroyed.

The disease has secured a foothold in Texas, also in the vicinity of Mobile, Alabama; in Louisiana it has reached an advanced stage, at Lafayette—this as far back as 1913—while it is now thought to have been established there two years prior to that. There are a few scattering infestations below the city of New Orleans. The agricultural experiment station of Louisiana has issued Bulletin 150, which we presume our inquirer may secure if he will send postage. The Florida experiment station issues Bulletin 225, giving specific information regarding sterilizing field boxes, ladders or any other orchard appliance which is taken from orchard to orchard. The paragraph which describes the sterilizing solution is as follows:

Method of Sterilizing.

Several methods may be employed for sterilizing field boxes, but those which use a gas are slow and expensive. A dip of copper sulphate solution seems to be the most economical and practicable. A one per cent solution of copper sulphate kills the spores of most species of fungi (so far as tested.) In practice it will be safer to use a stronger solution, not less than five per cent, since the canker fungus is very resistant, and certain factors are likely to decrease the efficiency of weaker solutions.

A long, narrow, wooden tank can be provided, capable of holding two or three thousand gallons of the solution. The boxes can be passed in at one end of this tank, submerged, and passed out at the other end after remaining at least three minutes in the solution. Boxes thus treated will dry rapidly and will then be ready for use. The boxes should not be exposed to the rain until after they have thoroughly dried. Some objection has been raised to the use of copper sulphate on account of the corrosive effect it has on iron nails and hoops. A copper deposit will form on the hoops and nails, which will result in a gradual weakening of the solution; but the direct injury to the metal will be so slight that it need not be taken into consideration.

To make a five per cent solution of copper sulphate will require five pounds of copper sulphate crystals bluestone) and 95 pounds of water. Since water weighs about eight pounds to the gallon the required number of gallons can easily be computed. (One pound of copper sulphate to two and a half gallons of water is a close approximation.)

Bichloride of mercury, formaldehyde and other fungicides are not as effective as copper sulphate. Efforts to control by cutting out parts of trees are not effective.

As a final suggestion to our Florida inquirer we would add, do not temporize with this disease. Absolutely destroy every tree which shows infestation and in order to know whether or not it is in the neighborhood appeal to inspectors or those in authority who will aid in keeping it down. More specific information may be had by writing directly to the experiment station of the university of Florida, at Gainesville, and asking for Bulletin 225 or such other information as the station may have.

Our Fruit, Nut and Olive Trees and
Grape Vines were awarded
the First Prize and
Gold Medal
at the
1914 STATE EXPOSITION
PRIZE TREES

WHY?

Because we have always been striving for the best and consequently have produced the best.

It was not luck—
To get that prize we had to work hard and conscientiously to produce just what you—the growers—want.

Into the growing of each one of our trees go science, care, and experience. By the intelligent selection of buds and parent trees, by expert application, and because we are located in a foothill district—free from pests—we produce hardy, well rooted—good bearing—disease free—trees—

Better, stronger trees—Larger, finer fruit—and Bigger crops.
All our trees are prize trees—profitable trees, the kind you want.
Buy foothill grown trees. We can supply the best of everything in all varieties.

WHAT ARE YOU PLANTING?

Olives
Apricots
Apples
Pears
Plums
Oranges
Prunes
Walnuts
Pomelo
Peaches
Clingstones
Freestones
Grapes

Think up your wants and tell us.

ASK FOR THIS.

Just say that you want it and we'll send you our catalogue of the best varieties of fruit and nut trees—full of useful horticultural information. Free for the asking.

Deep Wells

A tip to those figuring on buying a deep well pump

First of all satisfy yourself as to the reliability of the firm that makes the pump, then find out the kind of service it is giving to those who have purchased one or more. Both of these points can be easily determined in relation to the Pomona Deep Well Pump.

We invite you to come to Pomona and find out for yourself the advantages of the Pomona Pump.

—see the Pomona Plant.
—see how the Pomona Pump is built.
—see the largest deep well pumping station in California.
—see how we meet the deep well pumping problem.
—study the experiences of those who have spent years of time and thousands of dollars in obtaining the present high efficiency.

If you cannot come to Pomona write for our pump catalog No. 54 "C" and state the depth of your well, etc.

NURSERYMEN'S CONVENTION

At the last moment advertisers have demanded so much of Cultivator's space that 13 engravings and a few notes of the recent state nurserymen's convention are forced over another week. Perhaps this is because we made the hoodoo number, but as there were some 30 or 40 people in the photos we thought that would overcome the jinx. Election will be over next week and everything will be smoother. And these engravings are surely of a bunch of handsome men.

EASY SCALE KILLER AGAIN

More than a score of years ago we recall the coming of certain agents with a sure cure for all kinds of insects and pests on orchard trees. It consisted of boring a hole to the heart of the tree and plugging with the cure-all which the agent had for sale, the supposition being that the substance was absorbed by the sap of the tree, making it so poisonous that all insects promptly disappeared. It was tried out, with the result that no one ever could observe any beneficial results. Some years ago the Los Angeles county horticultural commission investigated and cut down an apricot tree which had been plugged and filled about a year previous. The scale had not been destroyed, and on splitting open the trunk the original material was found in the hole, apparently in exactly the same condition as when first put there, with nothing to indicate that any of it had been absorbed by the tissue or the sap of the tree. An illustration showing the failure of this effort was used in the Cultivator at the time. However, now comes from an authentic source the following in a publication called "Science," and from an investigator at Stanford university. At first we thought it was intended for the humorous column, but from its tone and the character of the magazine in which it appears it is apparently intended as a serious proposition.

"An Experiment on Killing Tree Scale by Poisoning the Sap of the Tree

"I have in my grounds a plant of Spanish broom about a dozen years old and with a trunk about four inches in diameter which has for several years been seriously infested by cottony cushion scale (Icerya purchasi). I have tried various sprays, have put scale-eating beetles on the tree and at one time cut all the branches off and sprayed the trunk several times in the attempt to get permanently rid of this scale, but up to last winter it seemed that all attempts were in vain. In February of this year when the broom was very thickly covered with the scale I bored a ⅜-inch hole in the trunk to a depth of about three inches, filled the hole nearly full of crystals of potassic cyanide and plugged it up. In two days the scale began to fall from the tree and in a few days all appeared dead. Others hatched and attacked the tree, but lasted only a short time, and the tree has since been free from scale and very vigorous.

"At the same time I bored a similar hole in an old peach tree which seemed to have passed its usefulness and put a like charge of potassic cyanide in it. The tree has since seemed more vigorous than before and raised a fair crop of peaches. After feeding some of them to chickens and a rabbit with no apparent ill result, I ate some of the peaches, and could find nothing wrong with them. I have since put a similar charge of the cyanide in an orange tree with no apparent bad effect.

"It would seem from this experiment that it is possible in some kinds of trees, at least, to poison scale and sap-eating insects without injury to the tree. The method would seem to be especially adapted to killing various kinds of borers and insects which, like the pine beetles, burrow beneath the bark.—Fernando Sanford, Stanford University, Cal., September 3, 1914."

SEVENTH NATIONAL APPLE SHOW

Spokane, Washington, is making great preparations for its Seventh Annual Apple Show. An immense pavilion with three large auditoriums, 90,000 square feet in the heart of the business district of the city, will be used for the great exhibit. Secretary Corbaley writes that all the Northwest is joining in this great national exposition, and jolly old King Apple is sending invitations to everybody to come to Spokane in November.

Planters

NOW is the time for you to decide upon what you will plant this coming season; or, if you are not quite ready, at least inform yourself as to the nursery that is equipped to supply you with the best quality of stock.

In buying trees you must consider the experience, facilities and reputation of your nurseryman. The first cost of a tree is small, considering the expense of planting, irrigating, pruning, cultivating, etc., and it is necessary, therefore, to get trees that are true to name and which will produce the best results.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Market for Duck Eggs

Is there any market at Los Angeles for Indian Runner duck eggs? If so what places or class of people use them? Also what price do they bring? People around here claim the eggs are strong and unfit for eating, and the most of the stores won't handle them. Do the ducks moult more than once a year?—Subscriber, Centralia.

One large store in Los Angeles is now paying 30 cents a dozen for Runner duck eggs, while another is paying 47 cents. This shows the unevenness of the market. In the spring there is a greater demand than now, duck eggs sometimes bringing a trifle more than hen's eggs. The market for duck eggs for the table is very largely among Jewish people, and the producer will probably do better if he seeks a market catering to this trade. Sanitariums also use a good many because they are considered absolutely free from tubercular taint. Tastes differ in regard to their desirability for eating, but many persons think very highly of them. Ducks molt but once a year, in the late summer, as hens do.—J. A. K.

Name of Peach

What is the variety of peach, specimen of which I send?—Subscriber, Los Angeles.

The peaches were submitted to several. They so closely resemble the Sa'way that we are sure it is either that variety or a seedling from it. The color, texture of the flesh and flavor are all like the Salway. The cnly point in which it differs is the slight tendency to cling to the pit.

Poultry Greens

What line of greens suitable for poultry can be grown without irrigation in the vicinity of Merced?—Subscriber, Merced.

I am not familiar with the soil about Merced, but I know that no sort of greens will grow without water. Some require less than others, and some will grow in a subirrigated soil which would not grow in a dry, sandy soil. Where the winter rains must be depended upon for the entire water supply there is nothing better than rape. Mustard and all kinds of grains may also be grown in this way. I think kale would do fairly well in a subirrigated soil. When it gets a good start in early spring it can be kept through the summer with hardly any water. The same may be said of cabbage, which is a first cousin of kale, and probably of collards. Alfalfa, chard and lettuce require a great deal of water. Rape and mustard will grow wherever grain will grow, and rape is especially valuable where quick growth is desired. After it is six inches high a flock of young chicks can run on it for weeks without destroying the plants. Barley and oats, sown thick, and cut in a clover cutter when a few inches high also make good green feed.—J. A. K.

Katydid Eggs.

I send twig from apple tree. Please explain the scales on it.—Subscriber.

If our subscriber had kept the twig long enough he would ultimately have had about a score of good, healthy

(Continued on Page 426)

Shall We Elect Phelan or Knowland

to Represent California in the United States Senate?

President Wilson

James D. Phelan

WHAT JAMES D. PHELAN SAID OF WOODROW WILSON—

James D. Phelan says that Woodrow Wilson sits in the White House on guard, an ideal public servant, caring for the interests of what he calls the "voiceless body of the people."

From a speech delivered by James D. Phelan at San Rafael, September, 1914.

WHAT THE PRESIDENT SAID OF JAMES D. PHELAN—

President Wilson says: "I was most gratified to hear of the nomination of James D. Phelan for United States Senator. He has been in close touch with the Administration at Washington, and has heartily supported the policies which have been inaugurated for the benefit of the people, policies, which I am pleased to be informed, have met with very general approval."

From a letter written September 11, 1914, by President Wilson.

WHAT JOSEPH R. KNOWLAND SAID OF PRESIDENT WILSON—

Knowland charged the President of the United States, Woodrow Wilson, with secretly meeting emissaries of England on holidays and Sundays and implying that a trade with England was consummated which betrayed the best interests of the people of the United States.

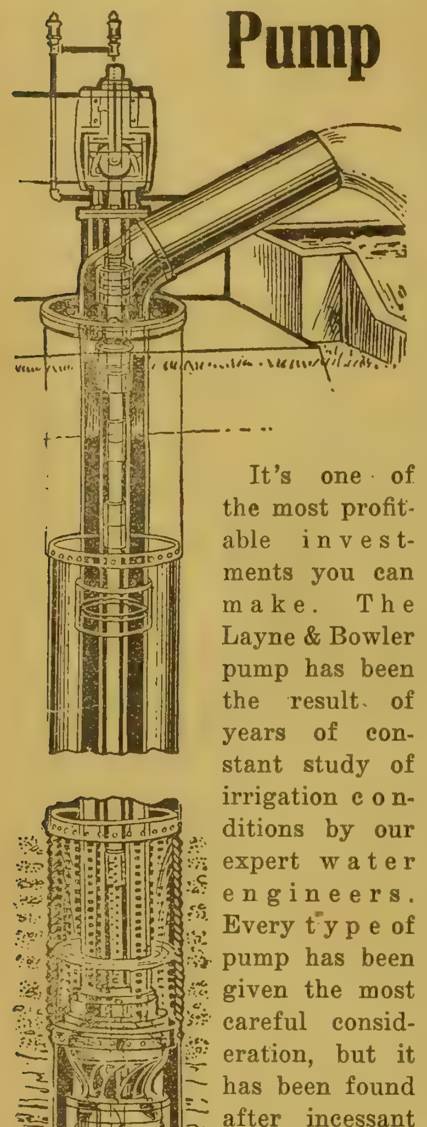
Speech of Jos. R. Knowland in House of Representatives, March 28, 1914.

WHAT THE PRESIDENT SAID OF JOSEPH R. KNOWLAND—

President Wilson said that the speech of Knowland was "just the crowning insult of a number of insults which had been introduced in that debate."

Press interview at Washington, March 30, 1914.

Which Man Can Best Serve You in Washington?



BE ON THE SAFE SIDE OF THE IRRIGATING QUESTION

There Should Be No Need To Worry About Your Water Supply If You Install The

Layne & Bowler Pump

It's one of the most profitable investments you can make. The Layne & Bowler pump has been the result of years of constant study of irrigation conditions by our expert water engineers. Every type of pump has been given the most careful consideration, but it has been found after incessant experimentation that the centrifugal multi-stage pump far excels any and every other type. Not only in theory is this true, but actual and practical tests have proven without a doubt the truth of the statement.

The Layne & Bowler pump secures the maximum supply of water at the least cost.

Our Catalog No. 30 gives complete information. Write for it.

Economics on the Farm

HOW THE EIGHT-HOUR LAW WILL AFFECT THE FARMER

By F. B. McKevitt

Extracts from address before Counties Committee of California Development Board meeting at Santa Rosa:

THE California farmer is opposing the enactment of the universal eight-hour law because the enforcement of such an act would mean his financial ruin.

The farmer's work is not steady and continuous in the sense that every working day in the year can be utilized in his business. In winter there are often long intervals of rain and storm during which no outdoor work is possible. Ground that is either too wet or too dry cannot be plowed, and much time is lost awaiting the right conditions. When they are right, the work must progress with all speed, and the limitation of an eight-hour day and a six-day week would very frequently prevent its proper preparation and completion.

It is presumed that in farm work a man's time would begin when he starts from the house to his work. If he is plowing, unless his team has been previously fed, watered, groomed, and harnessed by another employe, he would have all this to do before he would be ready to start for the field. Should this be done for him, and the team stand ready for him to drive away, even on a fair-sized ranch it would usually take from 15 to 30 minutes to reach the field, hitch up, and get to work, with an equal loss of time in unhitching and getting to the farm at noon, this being repeated after lunch and again at night, making a total loss of time in actual performance of labor of from one to two hours per day, so that an eight-hour day to the farmer would mean six, or at best, seven hours per day actual work. Farm work, especially in planting and harvest, cannot be done on such a basis, unless it were possible to run two shifts of men. This is not feasible nor practicable for several reasons: There are not enough workmen to be had at such times, as every farmer is busy, all wanting men at the same time, and two shifts would require the employment of twice as many as before; if the men were available, horses could not stand 16 hours of work, and it would be necessary, if the business were to be handled in this manner to double the equipment of stock.

Farming operations conducted with two sets of men and two sets of stock would show losses, giving "fits" to profits that are frequently so small that a powerful microscope is necessary to see them.

Many farms are located at considerable distances from market or shipping points. It may take more than eight hours to haul and deliver loads of produce, or if nearer, unexpected delays or accident may hinder the return. Under this law what would happen if the eight-hour day for the driver were ended when he was only part way home? Stop the team, tie to a fence, and wait for someone else to drive in? If not, and the same driver finished the trip, his unfortunate employer would immediately, in the eyes of the law, become a criminal, with both fine and imprisonment staring him in the face. Can anything be more ridiculous?

Under this law California would become a Mecca for every working man in search of short hours and our high wages for farm work, changing the present situation of a shortage of labor at harvest time to a surplus. What would we do with these men in the off season, when the demand for labor is at its lowest ebb? It would mean a large army of unemployed through the winter, with the bread line and the free soup kitchen an institution in every community—a condition distressing and repugnant to every right-thinking man.

Competition establishes prices. The California farmer meets the competition of the world. How could he do this working on an eight-hour basis with the balance of the world on a ten or twelve hour basis? There can be but one answer to this question.

Thus, we have three very good reasons for opposing this law; first, impossibility of getting work done on eight-hour basis; second, inability to meet competition of farmers of other states, and, third, sure losses instead of hoped-for profits.

So much for general farming. How about the dairyman, with cows that must be milked every night and morning, and on Sundays as well as week days? The same altruistic Socialist in whose fertile brain this industry-paralyzing measure was conceived will perhaps come to our aid and, by legislative enactment, produce an eight-hour cow warranted to require milking six days in the week only.

The fruit grower is worse off, if possible, than his fellow farmers. He is even more subject to the weather than they, and his crops are more perishable. His work is almost entirely in the open. As soon as the crop is off, pruning and spraying must begin, these operations leading up to plowing and cultivation, thinning the young fruit and harvesting the crop—all depending upon weather conditions, which sometimes shorten the working season by one-half. Ground must be plowed when in suitable condition as every farmer knows, and an eight-hour day would be too short to complete the work. If we could regulate the storms and the drouth on the Socialistic eight-hour and six-day basis, all would be well. These irresponsible, would-be philanthropists have not yet tried to legislate on the weather, however, so if the law is adopted we must struggle along against nature and do the best we can to reconcile her to the insane theory of an universal eight-hour day.

Ripening fruit must be picked when it is ready. A delay of a single day may unfit it for shipment. When the warm north winds come, it seems to ripen even faster at night than in the day. To limit at this time the hours of labor, or to say that for one day in the week no work shall be done, may practically confiscate a portion of the crop, may render useless that for which a year's endeavor and expense have been expended. If the fruit growers were all doing well, if their industry was making very profitable returns, these losses might be met and the businees continue, but unfortunately the fruit man does not always make money. His crops may be poor, frosts and insect pests sometime destroy, and markets are not always good. Frequently there may be no profit at all.

If these are the conditions now, what would be the result of increasing labor expense by not less than 20 per cent and decreasing available labor by at least 20 per cent more? In the fruit business practically all labor is hand work. About 40 per cent of the cost of moving fruit is covered by this item. With dried peaches selling at 3½ to 4 cents per pound, when actual cost is 5 cents, and the finest table grapes in the world bringing 65 to 80 cents per crate in the East, the cost of freight, refrigeration and package being 55 cents, it does not take an expert to figure where an increase of 20 per cent in cost would bring the shipper of peaches and grapes, two varieties which represent over 50 per cent of our Eastern fresh fruit shipments.

These conditions are so well known and understood by farm workers that there was no demand on their part for a universal eight-hour day. They did not ask for it, nor did organized labor in the beginning demand it. The idea originated with the Socialists, who prepared the petitions and secured the signatures thereto.

Is there any need for such a law for the protection of labor? It has never been urged that farm labor is unhealthful. On the other hand, there is no class which enjoy a greater degree of health and strength than farmers, whose occupation is almost entirely out of doors, and while theirs is not to be classed as easy work, it does not entail unusual or excessive demands on the strength. That the hours of labor are long will not be denied; that they can be made less is possible, but if farming is to prosper it would be only when they are made the same in every state of the Union.

CLINGSTONE PEACH TREES

California Cling Peaches, superior in size, substance, flavor and keeping qualities — the highest standard! The canning peach in demand by all the world.

TUSCAN — Ours are the IMPROVED ROUND TUSCAN. Firmer, more symmetrical, more uniform, finer grained, less subject to windfall and splitpit than the oblong Tuscan, commonly propagated, and preferred by canners to the extent of $2.00 to $5.00 per ton.

PHILLIPS—Preferred by canners to any other late variety—small but meaty—clear yellow to the pit. We cut our buds from a block of trees that are an exceptionally good strain of this variety.

Also all other standard varieties. You'll get the best from us—Tell us your wants.

EIGHT HOUR LAW NOT TRULY SOCIALISTIC

We give below communications from one opposed to the eight-hour measure and from one friendly to it, and the strangest part of it is that the one opposed to the bill is a socialist. We say, "the strangest part," though that should not be the case, for the socialist in the highest sense is one who is working for the good of all, and Mr. Berneike shows conclusively that from the true socialistic standpoint this bill will not work for the best interests of all. In this we agree with him, but for a different reason from his, for if this bill were in the interests of all it would not discriminate so much against the employer. It provides for punishment for only one of those who join in violating the law. The laborer may be as guilty as the employer in transgression of the law, and for him the law provides no punishment, and this is not contrary to the socialistic idea, we have never yet understood it.

There is much in the higher teachings of socialism which appeals to many of us who would see our country progress. We once heard President Gates of Pomona college in addressing an audience say in a half whisper, "You must not tell it to anyone else, but really I am somewhat of a socialist, but because of many unthinking socialists proposing so many impractical things true socialism has been discredited." We believe that just such measures as this eight-hour bill injure the socialistic propaganda. If socialism is going to win it must be just to both sides in any question at issue, but we will allow our correspondents to speak for themselves.

THE OTHER SIDE

Written for California Cultivator

By A. C. Masteller

It seems to me that your intense opposition to the establishing of an eight-hour law by popular vote is not consistent with modern progress and evolution. I can remember quite well when the average farm day was from daylight until dark, no matter what the season, and so-called chores were done by a lantern irrespective of the season. I am very glad to say that it is not so at the present time, and in view of the fact that the modern farm work is being done more and more by machinery, I think you are doing the workers and farmers themselves an injustice in opposing the bill. In our county, where the tractor is used very extensively, it is operated by three crews, eight hours each, and I am pleased to inform you that among the citrus growers of this community, of whom I am one, a very large number will vote for the eight-hour law. Also on the board of directors of Butte County Citrus Association, of which I am a member, there is a majority in favor of the law.

I was instructed once in a very impressive manner as to the division of the 24 hours of the day. I was told that we should divide it into three parts of eight hours each; one for labor, one for refreshment and sleep, and one for the service of God and our worthy brothers. Probably you have been told the same thing in the same way, I have no way of knowing, but any way I hope to be consistent and uphold the teachings of what is considered the greatest order on earth.

We will never arrive at a satisfactory condition of society so long as we must do it by considering our own selfish ends in every question that comes up. I can see that if the workers of this country were receiving 60 per cent of the product of their labor we would have an unlimited market for all our products. But when we see the workers, who are the consumers as well as producers, working for wages that do not permit of any luxuries it is no wonder that we sometimes get red ink for our returns.

EIGHT-HOUR LAW—YES OR NO?

Written for California Cultivator

By J. G. Berneike

I shall vote "No" on proposition No. 3, November 3d, but not because it is socialistic or because it has been proposed by a socialist. To offer this as an objection appears to me childish and absurd, and betraying lack of information and reasoning. In fact, in the case of very many intelligent people it would be almost a sufficient recommendation to know that the proposition is socialistic and has been proposed by a socialist.

If the proposition found favor only with the socialists, of course it could not pass. It will enlist many voters of other parties as well. But I wish to say right here, that I am a socialist and I expect to vote "No!" I wish to say that to vote on such a proposition is not a partisan question, and that no socialist is obliged to vote in its favor because it has been proposed by a socialist or because it is dubbed "socialistic." It is time we learned that through the initiative and referendum the state has become a wide legislative hall in which every voter has the right to make a motion and ask for its consideration and vote acording to his individual judgment.

The author of this law believes that this law will help the small farmer and help to break up the large land holdings.

Will it help the small farmer? That is for me to consider, because I am

The Care and Feeding of Crops

Maintenance of Soil Fertility

"There are three ways in which the essential plant-food may be added to the soil. These are the growing and plowing under of cover crops, known as green manuring, the use of barnyard manure and similar products and the application of commercial fertilizers——"

"Unfortunately, in the West, especially in unirrigated sections, the use of green manuring is limited by the lack of sufficient moisture, while the supply of barnyard manure and related waste products is, of course, insufficient to meet the demand.

These two types of manuring greatly improve the physical condition of the soil and are very beneficial. They should be practiced whenever possible, but, in order to supply sufficient of the available plant-foods to meet growth requirements and thus produce a large profitable crop, commercial fertilizers must be used."

This is a quotation from our book, "The Care and Feeding of Crops." You ought to get a copy at once. It contains most valuable information on soil treatment and crop raising.

Our "Gaviota Brand" Fertilizer supplies proper proportions of the Soluble and Available Plant-Foods, Nitrogen, Phosphoric Acid and Potash, to meet the Food requirements of the Plant throughout the growth period.

Write for our book, "The Care and Feeding of Crops," to-day. The knowledge contained therein may be the means of making a success out of failure in your crop raising.

Farm Bureaus

IN THIS department we hope to give announcement of meetings of all farm bureaus in the state. These meetings are proving wonderfully beneficial, a roundtable for solving of many farm problems. We ask the aid of every farm adviser in the state in this matter.

Kern County

Kern County's farm bureau held its first annual meeting at Bakersfield, October 10, when representative gatherings of farmers met and organized, starting off with over 200 members enrolled and an enthusiasm for the work that is planned for the future. Fred H. Hall was elected president of the farm bureau, and other officers elected were as follows: C. H. Styles, vice-president. Directors — W. W. Phelps, E. E. Pyle, N. W. Taussig and George H. Peters. Farm Adviser R. R. Mack announces meetings for November as follows: Wasco, November 2, W. T. Fowler, director; Delano, November 4, R. H. Hiett, director; McFarland, November 6, H. L. Heard, director; Panama, November 9, A. B. Robinson, director; Rosedale, November 11, John Waters, director; Rio Bravo, November 14, F. W. Haage, director; Arvin, November 16, R. Haven, director; Tehachapi, November 18, L. T. Jenkins, director; Muroc, November 20, C. W. Robb, director.

Napa County

Farm Adviser H J. Baade writes: "At present the farmers are buying lime in carload lots, finding out that it is more satisfactory for the centers to work together and get the material in quantities. While our local dealers are always glad to cooperate with the farmers, yet it seems that lime can be handled most economically by the farmer himself, and as such, the centers are buying their lime through their own communities and are finding it more satisfactory. This county will probably buy from ten to fifteen carloads through the various centers this year. There are other cooperative movements now under way of which I shall gladly speak to you later.

"The following will be the schedule of the Napa County Farm Adviser for the month of November, 1914·

"Napa, November 2; Coombsville, November 3; Browns Valley, November 4; Salvador, November 7; Carneros, November 9; Fly District, November 11; Suscol, November 13. Directors of Farm Centers meet in Napa, November 14; Rutherford, November 16; St. Helena, November 18; Calistoga, November 20; Wooden Valley, November 23; Berryessa, November 25; Howell Mountain, November 27; Pope Valley, November 30.

"Pruning will be discussed at these meetings, also tree surgery. Anyone interested in these operations is cordially invited to attend. Mr. J. J. Fox, our horticultural commissioner, will be glad to attend any of these meetings where a few days' notice is given him by the director of the center."

San Diego County

Farm Adviser James A. Armstrong announces schedules of November visits to thirteen farm centers. Other centers will be visited in December, two communities combining in meetings each month, so that one month, for instance, the Encinitas center meets with the Del Mar center; the next month Del Mar meets with Encinitas, etc. The November meetings are:

Del Mar, November 2, Encinitas visiting; San Luis Rey, November 4, Vista visiting; Bonsall, November 6, Fallbrook visiting; Ramona, November 7, directors' meeting; San Marcos, November 9, Escondido visiting; Ramona, November 11, Julian visiting; Alpine, November 13, Dehesa visiting; Spring Valley, November, 16, Lemon Grove visiting; LaMesa Heights, November 18, El Cajon visiting; Jamacha, November 20, Jamul visiting; National City, November 23, Chula Vista visiting; Nestor, November 25, San Ysidro visiting; Mission Valley November 27, Poway visiting; Potrero, November 30, Campo visiting.

A great "Back Country Day" is being planned at Ramona, November 7. This is a directors' meeting, but others are invited. It is hoped to have a very large attendance. There will be addresses and demonstrations on use of dynamite. The domestic science department of the state normal school at San Diego will demonstrate the topic, "How to Feed the Farmer." An enjoyable feature of the meeting will be a basket lunch in a beautiful grove.

The committee of arrangement for the event is composed of W. E. Woodward, chairman; James A. Armstrong Henry Baldwin, Cecil Stockton, Mrs. H. A. Mills, Mrs. Dr. Scott and Mrs. W. B. White.

Alameda County

Farm Adviser W. H. Nixon, Hayward, writes:

"With regard to my work I have only been here a couple of months, and of course have as yet no results to tell of. Am devoting most of my time to preaching cover crops in the orchard districts; more thorough spraying and better care in the control of peach root borers. In the grain country am making a campaign for the use of better seed. The agriculture in this county is so diversified that each little district presents a problem entirely different from any other. Therefore am not able to undertake any work on a county-wide scale.

Schedule of visits for November: Hayward, November 2; San Leandro, November 4; Vastro Valley, November 6; Livermore (Murray Township Center), November 9; Pleasanton, November 11; Oakland, November 3; Irvington, November 17; Centerville, November 20; Newark, November 23; Niles, November 25.

Ventura County

Farm Adviser William B. Parker, County Court House, Ventura, writes: "The following is my schedule for the month of November; Filimore, November 2; Nordhoff, November 4; Ventura Avenue, November 6; Oxnard, November 11; Camarillo, November 13; Somis, November 16; Saticoy, November 18; Moorpark, November 19; Santa Paula, November 24; Simi, November 25."

San Joaquin County

Farm Adviser Frank F. Lyons, 223 East Weber Avenue, Stockton, sends us a copy of the first issue of "San Joaquin County Farm Bureau Monthly." This gives in brief form important facts as to humus getting, reviews of two new bulletins issued by the state university and announces coming meetings of the farm centers. The last page is given to the "Farm Bureau Exchange," where, under "For Sale" and "Wanted," are listed stocks, hay, implements, etc., for sale or desired by members of the bureau.

Schedule of meetings of farm centers up to November 18: Thornton, November 2; Lodi, November 3; Acampo, November 6; Lockeford, November 9; Linden, November 11; Escalon, November 16; Farmington, November 18.

SENSITIVE

Mistress—Why, Mary, isn't this your Sunday afternoon out? Aren't you going for a walk this lovely day?

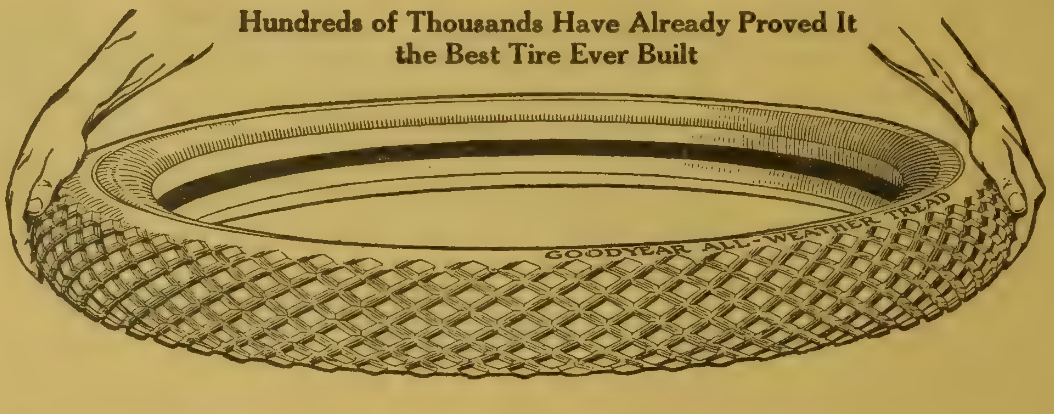
Mary—Please, ma'am, I'd rather stay in. You see most of the people out on a Sunday is couples, and I don't like to be conspicuous.—London Punch.

THE RECOGNITION

Friend—Hello, Pat! I scarcely knew you with your whiskers off.

Pat—The same wid me, me boy. I didn't know meself when I looked into the glass except by the sound of me voice.—London Telegraph.

Here's the Safe Tire
The Strong and Sturdy Trouble-Saver to Which You Are Bound to Come
Hundreds of Thousands Have Already Proved It the Best Tire Ever Built



Get Goodyears Now

Now—for fall and winter driving—is the time when Goodyear tires mean most.

On these tires alone come these All-Weather treads. They are tough and double-thick, resisting puncture and wear to the limit.

They are flat and regular, so they run like a plain tread. Yet they grasp wet roads with hundreds of deep, sharp, resistless grips.

For safety's sake—if for nothing else—every wheel should now be equipped with these ideal anti-skids.

You want to minimize blow-outs. We do that, at an extra cost of $1,500 daily, by our exclusive "On-Air" cure.

You want to combat loose treads. By a patent method—used in Goodyears alone—we reduce this risk 60 per cent.

No other tire employs one of these ways to combat your chief tire troubles.

Say You Want Them

The way to get Goodyears is to say that you want them. Any dealer will supply you. These are the ruling tires. They have won more users than any other tire. It is time that you know them. And now—when your tires face the year's hardest usage—is the time to find them out.

For your own sake, do it.

Your Other Needs

You also want a tire that can't rim-cut. That means the Goodyear No-Rim-Cut tire.

WATER COMMISSION ACT, NO. 6 ON BALLOT

Written for California Cultivator by H. Culbertson

To the irrigators of the state the above act is a very important one. To the writer's mind it is not receiving nearly as much attention as its importance demands. The law is largely a copy of one that has been in use in Oregon for some years and has worked well. Colorado, Wyoming and other states have had excellent laws of this kind for years. California has no irrigation law in reality. If differences arise you go to court, and the party with the longest purse wins. The proposed law provides a law to begin with and appoints a commission of three beside the governor and civil engineer of the state to examine itno all differences in water right claims, rates, etc., and to settle the difficulty with minimum of expense. It may work some hardship to certain attorneys who fatten on water dispute cases. Under this law a person cannot file on thousands of inches of water and prevent any one else using water and not use it himself. Under the proposed law a person or company is allowed to claim the water actually used, but they cannot be dog in the manger and not allow any one else to use water they are not using. Many of the streams of the state have had water filings on them to several times the actual supply, yet only a small part is actually used. The proposed law authorizes the commission to examine into and settle the conflicts. Under it water claimants that make no effort to develop water, but simply hold on to it in hope of bleeding some one in a purchase who wants to use the water will be simply let down in favor of the one who actually uses the water. The law takes the water question out of the hands of the railroad commission and puts it into the hands of a water commission. This is well, because it has developed that the business assigned to the railroad commissoin is by far too great for one body of men. They have done nobly, but the water business of the state is big enough for one set of commissioners. Other states have found it abundantly large enough.

This law was passed by the last legislature and signed by the governor. It was fought in the legislature severely by certain interests. These interests are the ones that caused the law to come up for referendum vote in the hope that it would be defeated.

It is up to the friends of fair dealing to get very busy and get every voter possible to vote Yes on No. 6, the water commission act.

WHAT WE IMPORT FROM EUROPE

So many inquiries have been made since the commencement of the European war as to the character of goods imported from Europe that the Bureau of Foreign and Domestic Commerce has prepared a summary showing the principal manufactures and manufacturing materials received by the United States from its European neighbors.

Imports from England last year included nearly $20,000,000 worth of cotton goods; $9,000,000 worth of chemicals; $2,000,000 worth of coal tar products; 48,000,000 pounds of crude rubber; 48,000,000 pounds of hides and skins; 53,000,000 pounds of block tin; 75,000,000 pounds of wool; 14,000,000 pounds of tea; and a host of miscellaneous articles.

Germany is our chief source for imported chemicals, its contributions last year exceeding $20,000,000 worth. Other important articles received from Germany last year were; $13,000,000 worth of cotton goods; 150,000,000 pounds of wood pulp; 35,000,000 pounds of palm and palm kernel oil; $8,000,000 worth of toys. Certain food products were also imported from Germany, the leading items being 65,000,000 pounds of rice flour; 7,000,000 pounds of crude cocoa; and $2,000,000 worth of spirits, wines and malt liquors.

France is the largest source of our imported silk goods, art works, automobiles and wines. Last year we got from "La Belle France" $22,000,000 worth of art works; $5,000,000 worth of chemicals; $18,500,000 worth of silk goods, to say nothing of what we paid for cotton laces, embroideries, perfumeries, etc.

Italy supplies large quantities of macaroni, fruits and nuts, olive oil, prepared vegetables, cheese and still wines. Netherlands is a leading source for diamonds and wrapper tobacco, and also sends us hides, fish, spices and tin. Belgium is our greatesct source for diamonds and sends us much rubber, hides and furs and linens. Switzerland leads as our source of imported cotton laces and watches and is important in the matter of cheese, silk goods and coal-tar colors. Ireland is first in its supply of linens.

FARMERS' PROTECTIVE LEAGUE

The Farmers' Protective League of California was organized on a permanent basis at a meeting in Sacramento of delegates from 30 counties. Frank B. McKevitt was elected president; G. H. Hecke, first vice-president; Mrs. Emily Hoppin, second vice-president. Directors elected are: L. F. Graham, San Jose; George H. Cutter, Sacramento; C. C. Teague, Santa Paula; C. N. Hawkins, Hollister; K. S. Knowlton, Bakersfield; R. J. Cooper, Selma; James T. Boyer, Visalia; George W. Pierce, Davis; M. D. Wilder, Santa Cruz; J. W. Gulberson, Corcoran. Two directors representing the upper Sacramento Valley are to be appointed.

Roy L. Allen of Hollister was appointed chairman of the important committee on ways and means, and the other committeemen are James T. Boyer, E. N. Richmond, G. H. Hecke and Geo. H. Cutter.

The league proposes to be ready to oppose laws that are harmful to agriculture and as well to espouse laws designed for the benefit of all.

Now $985

Beginning with October, the 1915 Detroiter price is reduced to $985. Extraordinary demand has practically doubled production since the new model was announced July 25. Costs have been cut and overhead reduced. The total saving per car is now a fraction under $65. This saving goes to the purchaser.

Detroiter

$65 Rebate

Every purchaser of a 1915 Detroiter to date will receive a cash rebate of the above amount. This applies to cars now in the owners' hands, in salesrooms or in transit.

The new price takes in everything. There are no extras. Westinghouse starting and lighting system is included; one-man top; ventilating rain-vision windshield; non-skid rear tires; duplex tire-carrier; emergency search lamp; electric cigar lighter.

For $985 you own the biggest car at its price, the lightest car of its class—less than 2300 pounds. The only car in America with a long-stroke BALL-BEARING motor. The handsomest car built.

With fuel and oil at present prices, you can drive the Detroiter 10,000 miles for less than $100. No other FIVE-passenger car in the world can better this record.

There are 35 unusual Detroiter features that have brought this big demand—and cut the price to $985. Call on the nearest Detroiter dealer, and he will show them to you.

Write today for our beautiful new illustrated catalog, just off the press.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

WATER COMMISSION ACT

A referendum measure submitted to the people to vote upon next Tuesday, placed Number 6 on the ballot, is the water commission act. We have said nothing regarding the act during the campaign, but it certainly seems to us that the muddled condition of irrigation matters in California calls for some simpler method of settling questions which come up. Certainly it could be no worse for the poor man, and it might be vastly better for him to secure his rights before a commission under this act than in the courts where no case can be presented without great expense. We believe it an entirely safe proposition to vote "Yes" on No. 6.

FEED COTTONSEED.

With all other kinds of stock feed reduced in price it is possible that the live stock feeder may not stop to think that cottonseed meal is also selling at prices much below those usually prevailing. It is a good time to make liberal experiments in cottonseed feeding. The annual crop of the United States amounts to about 6,000,000 tons and this immense quantity is simply the by-product of the great cotton industry, though from the tonnage it would appear to be the principal crop of the cotton field. For every pound of cotton fiber or lint there are two pounds of seed which formerly was thrown away. Henry says that in his "Feeds and Feeding:"

"Cottonseed and cottonseed meal are among the richest and heaviest of feeds. When fed in limited quantity with a proper complement of other feeding stuffs, exceedingly satisfactory results can be secured with dairy cows and fattening cattle. Wet, moldy, cottonseed, or that which has heated, should never be fed."

BARLEY

The production of barley in the entire United States is estimated this year to be about 203,000,000 bushels. Of this amount California produces close up to one-fourth, or, to be more exact, 44,400,000 bushels.

In corn we do not make so much of a showing. However, it is somewhat of a surprise to learn that in this crop, of which we consider ourselves non-producers, we still produce 2,300,000 bushels. The entire United States produces considerably over two and a half billion bushels.

SOME GOLD.

The output of gold from the state of California for the year 1913 was $26,812,489, an increase of nearly a half million over the production of 1912, and in fact the greatest production in 31 years. For the sake of a bit of comparison of the worth of the mining industry with the fruit industry we may mention that oranges brought to the state several millions more than its gold mines and the best of it is that the orchards are ready for another year's production equally as valuable, and the lands occupied by the orchards are worth more today than before last year's millions were produced. This is not true of lands that are being destroyed to secure gold. Their productivity is gone forever once the gold is taken out.

If the next state legislature does not take some definite action to save these lands to our state it will be high time for the initiative to be invoked to stop their destruction. The country needs gold, but there are ways of securing it without destroying valuable and productive acreage.

GOING IN A BODY

The fruit growers of Goleta, headed by the chamber of commerce, announce that they propose to go to Los Angeles in a body to attend the state fruit growers' convention, badged and filled with enthusiasm for their own community, and root generally for Santa Barbara County. Commissioner Beers announces that he is doing some tall advertising and that Santa Barbara County proposes to capture the whole convention. It is also expected that the Claremont Pomological Club will contend with the Santa Barbara people for a bit of attention of the convention. And from the far north, while there will be no large clubs or organizations, there will be representatives of many. It surely will be a big convention.

The committee on arrangements has forwarded practically 35,000 pieces of advertising, and people from all over the state are fully informed of the good things which will be given at this convention. The committee has arranged for a most excellent parking ground for the autos of all who attend. The space is immediately around the assembly building and is almost perfect for parking purposes.

The greatest day of all the convention will probably be Thursday when some of the best talent in the country will discuss matters pertaining to soils. One of the best features on the program will be given by the ladies in their afternoon sessions which will be held apart from the larger convention in the parlors of the Hotel Clark, which will be headquarters. The Hotel Clark, by the way, is one of the most homey, comfortable hotels in California and will add to the pleasure of the convention.

LAND TITLE LAW

Every registered voter in California will soon receive, if he has not already, a book of 112 pages which will give all the proposed amendments to the constitution, referendum, initiative, and other measures. The full text of the bills will be in this book, together with arguments for and against. This will give but little over a week for electors of the state to familiarize themselves with these measures, though in the case of many like the eight-hour law, minds are already made up. But one measure which should have the careful attention of every property owner in the state is numbered 22 on the ballot. It is the land title law, an initiative act which requires several pages of fine type of the book to give the text. The argument in favor of the bill need not be given here, but we may say that careful thinkers who have made thorough examination of this bill assure us that it will result in simplifying and cheapening land transactions, and at the same time give assurance of titles far superior to anything now existing. Guaranty companies which are giving certificates of title are fighting this measure and are endeavoring to prevent the people from receiving relief. We would suggest that every voter read the arguments for and against this bill, and we are sure favorable consideration will be given to it.

EIGHT-HOUR LAW—YES OR NO?

(Continued from Page 417)

one of them. In my judgment this law will not help the small farmer, but place an additional burden on him. He has enough of them now. He takes the risk of getting a crop, takes the risk of getting a paying price after he has the crop, if he has a mortgage he pays a high rate of interest, which goes on, crop or no crop, price or no price. By having this law passed he would add to his burdens, facing a criminal suit at any time if in his own judgment he thought it necessary to save his crop by "requiring or permitting" his help to work overtime. It would, of course, be the prosecuting attorney's duty to prosecute every case of violation of the law. The burden of proof of his innocence would rest on the farmer (and when found guilty or innocent, he would have to pay a handsome fee to his defending attorney. Or if in the judgment of the court his judgment of the necessity of saving his crop by working his men overtime was not good, he would face a fine or jail term.

To employ two shifts of men when he had a hard time to rake up even one full shift is out of the question. With nine years of experience in drying apricots I believe I know whereof I speak.

Under the full sway of socialism it would still be necessary to take into consideration the uncertain elements of nature. And this would be done, too. Agriculturists would find their own rules and regulations for carrying on agricultural industries, and these would naturally differ from those of factories.

What may be excellent as factory legislation may be entirely inapplicable to the farm. I can see that the proposed law would work hardship at times even in a factory when it is necessary to fill a rush order. There is no way out at such times but to work overtime, because it is impossible to expand the factory at will, or obtain the necessary skilled help. Both employer and employe would lose if the rush order could not be accepted.

I shall vote "No" because I cannot afford to lose part of my crop for lack of sufficient help; I must try to produce all I can off the land I have (in accordance with socialist ideals), and suffer no part of my crop to be lost. I shall vote "No," because I do not want to see law suits multiplied and have the farmers fee(d) the lawyers and impoverish themselves. I shall vote "No," because I believe the law is not truly socialistic.

Agricultural News Notes

Experiments are being made in manufacture of vinegar from pineapple juice.

The annual meeting of the National Grange will be held at Wilmington, Delaware, November 11-14.

There is a hot fight on in Australia between manufacturers of oleomargarine and butter makers as to whether oleo may be colored yellow or not.

The application of the Illinois railroads for permission to increase grain rates five per cent has been denied by the Illinois public utilities commission.

The forestry commission of the Hawaiian Islands distributed 13,692 trees to the public in the month of July for reforestation of bare spots in the islands.

Throughout the national forests the rangers are posting the roads with permanent guide signs which tell distances and directions, especially at forks and crossroads.

The fruit most largely grown in Australia is the apple. Most of the output goes to England, but some shipments are made to Germany, the far East, South Africa and South America.

Advances will be made to cotton planters of Nyasaland in west central Africa on account of cotton which cannot be shipped owing to the war. Funds are supplied by the Council of British Cotton Growers' Associations.

The leading French horticultural paper, the Revue Horticole, recently announced that it would cease publication for the present, as its whole staff, editors, correspondents, clerks and printers, had been called to the front.

The spread of citrus tree canker in Florida, Alabama and Mississippi is very alarming to growers. Many urge burning of all affected trees to stamp out the trouble. Trees are covered with oil and burned as they stand.

The American Poultry Association, recently meeting in Chicago, established standard weights for Leghorns as follows: Cocks, five and one-half pounds; hens, 4; cockerels, four and one-half; pullets, three and one-half pounds.

The Percheron Society of America now recognizes 48 shows and fairs in the United States and nine in Canada. The total prizes offered for 1914 in cash, medals and cups, together with incidental expenses, will aggregate about $18,000.

A press despatch states that the federal railroads of Switzerland in August of this year, the month in which as a rule their earnings are largest, had traffic receipts of only $2,002,0000, showing a falling off of more than 50 per cent.

A large amount of government aid has been given to the agricultural population of Hungary. Various courses and lectures have been instituted, and the authorities have distributed gratuitously, or at cost price, a great number of appliances for fruit growers, as well as over 500,000 nursery fruit trees at reduced prices.

The opening of the Panama Canal has so increased water shipments of freight from the Pacific Coast that the transcontinental railroads have petitioned the interstate commerce commission to allow them to reduce rates to Pacific Coast terminals on 107 commodities sufficiently low to meet water competition without making a reduction in the rates on these commodities to the intermediate points.

The new cotton gin at Somerton, Arizona, has begun work on the cotton crop of Yuma valley. The cotton fields are promising a very fair yield.

Idaho expects to market 10,000 carloads of potatoes. The acreage is less than usual but the output will be practically as large as in former years.

Ground Limestone
for
Agricultural Purposes

Nearly all lime used, no matter in what form, is prepared directly, or indirectly, from deposits of Calcium carbonate, chief of which is Limerock, from which our Ground Limestone is made.

We quote as follows from the Kentucky Agricultural Exp. Station, Bulletin No. 84, under heading "Lime for Agricultural Purposes."

> "Fresh burnt lime and hydrated lime may give better results the first year than ground limestone, but this is because of its caustic effects on the organic matter of the soil, causing a more rapid giving up of nitrogen. Experiments in Maryland and Pennsylvania show that used through a long period of time, the raw ground limestone gives the better results."

Our Ground Limestone is made from the highest quality limerock obtainable, and is ground to the proper degree of fineness recommended by the University of California.
